NAMDA ON REVIVAL PATH

Even as a breakthrough is waiting to happen, five trainees were enrolled on Tuesday 5th Dec 17 by Adani Skill Development Centre (ASDC) for the age-old Namda craft, a dying art form of Kutchh district in Gujarat. First initiative of its kind, the skill development training on Namda is aimed at preparing a future generation of artisans for the historic art form.

Adani Foundation, the CSR wing of Adani Group had vowed to save Namda from extinction and bring back its past glory. Originally innovated by an artisan of Mughal Era in the 11th Century India, Namda craft was primarily practiced by the Pinjara and Mansuri communities and Sama Muslims native to Kutchh. Sans proper encouragement, marketing avenues and promotion, the art suffered a major setback with artisans gradually switching over to other professions for livelihood earning.

Till recently, when the Adani Foundation, Mundra team members approached Mansuri Karimbhai Umar bhai, perhaps the sole survivor of the craft in Kutchh, Namda was dying a natural death. As a good corporate citizen, the Adani Group initiated a move to protect the art form, as well to make it popular and sustainable.

The first step towards the enormous goal of reviving Namda, the training programme kicked started with lots of positivity and enthusiasm among the trainees, who are committed to put best efforts for bringing back the past glory for this craft. And the best part of the initiative is that, the Namda survivor himself would train the future-artisans.

GREAT ACHIEVEMENT IS....

KARIM MANSOORI ONCE AN ORDINARY NAMDA ARTISAN IS NOW AN ENTERPRENUAR. THE ADANI FOUNDATION FEELS CONTENTIN REVIVING THE DYING NAMDA ART FORM AND SUPPORTING MANSURI IN STARTING HIS OWN BUSINESS.

HIS JOURNEY IS OFF TO TO A FLYING START AND WE WISH HIM ALL THE BEST.

Utthan : Enhancing Quality of Education !!

Navinal is a small village of Mundra Taluka. The village boasts of the works done by the goodwill of the Mahajans.The village is inhabited by approximately 1000 people. Rameshbhai Sathwara , his wife Champaben along with their three sons are one of the families residing over here. Rameshbhai is a greengrocer and lives a contended life with his family. The eldest son 14 year old Haresh and the middle one 10 year old Lalji study with devotion and bring good result with god's grace and the blessings of the elders of the family. Their final result would bring a new ray of hope for the parents every year.

But the youngest son, Sanjay studying in class 3 could not read or write. Even after a lot of efforts nothing could not make him read and write. He himself did not even feel like reading or writing. It was meaningless to drag him into learning without his own willingness. The teachers also accepted Sanjay as a dull boy and didn't pay much attention.

But one August morning became august for this boy as it brought a bright ray of hope for him.

A new teacher who had come to teach students like Sanjay talked to Sanjay in his Kutchi mother tongue and this attitude of this teacher made the little boy go wonderstruck. The new teacher made them sing a lot of poems, showed a lot of colourful books and told them a lot of stories. Her attitude interested Sanjay and he willingly came ahead. He sat in the first raw and told the teacher about a lot of things including the beehive outside his home, his parents and elder brothers. What appealed Sanjay the most was the constant attention paid by the new teacher to him. The next day led Sanjay to the special classroom made for the students like him.

Thus, every morning became a new, exciting morning for him.

And today, the innovative rangoli making in shape of alphabets using the fallen tree leaves interested him so much that he got interested in writing letters. This interest led him to write alphabets and later words. Moreover, he got interested in co-curricular activities like reciting poems and colouring the pictures.

The factor that attracted him the most was the loving teacher and this teacher is Hansbai Gadhvi. A resident of Mundra itself Hansbai, studied at Adani Public School. She provides her services to Adani Foundation's Utthan programme.

The Utthan project is the result of the agreement under which Shri Bhupendra bhai Chudasama, the Minister of Education of Gujarat assigned the responsibility of improving the quality of Education to the Adani Foundation. And the responsibility has religiously been accepted by Shri V.S.Gadhvi Sir for the 17 government primary school. Shri Gadhvi Sir has taken it as a mission for the foundation to lead the below average students to the upper level. The teachers having command over Hindi, English and Kutchi have been providing their services in these schools.

The Utthan Project initiated in August 2018 has been heartily welcomed and appreciated by the students, parents and teachers of this area. Under this project, the children who are weak at reading, writing and basic calculation are taught in such innovative ways that their foundation becomes strong and they can come into mainstream level of their class.

The best characteristic of this project is introducing English language from the class 1. Talking about the co-curricular activities, these schools have been facilitated by libraries, smart class rooms and sports equipment.

The efforts are made with a hope that these children get the benefit of this teaching mission and move towards a happy, bright and prosperous future.

Utthan : Enhancing Quality of Education !!

"Her eyes today had a shine so different, so divine, probably astral... was the shine real or an illusion? Or it was a simple result reflecting the efforts put in?"

These are the words of Siddhi Shah who is one of the teachers working as Utthan Sahayak in the Utthan project. She works in the Zarpara village, a village where the chief occupation is agriculture and this works as the chief reason behind the irregularity of children in attending school.

The area in and around Zarpara is quite vast and looking at this only the Government has approved 6 Government Primary Schools. But the scenario on the education side is still dismal. There is a long way to go to achieve the desired results. The teachers like Siddhi Shah who work as Utthan Sahayak have their role here. They play a key role in leading the children to school and bringing their academic level up.

Let's talk about what Siddhi Shah has to say about one such girl Prgna who studies in the Khoyadi Government Primary School.

Pragna's father Haribhai is in agriculture field and rearing cattle. This work cannot be carried ahead without the support given by the wife and thus the mother Malsriben too is busy helping the husband in his daily work along with shouldering the responsibilities of performing the household chores of a joint family and bringing up of her own three children. Hence, she finds it difficult to monitor the schooling of her children.

Pragna herself did not have much interest in studies and being the only girl child of the family, Pragna didn't take going to school seriously.

Siddhiben Shah would check the attendance registers daily and would go to meet the parents of those children who do not come to school regularly.

Pragna's irregular attendance was noticed by Siddhiben Shah and she decided to visit her home.

Once she visited her mother Malsriben and persuaded to send Prgna at school. This worked and Prgna started coming regularly. To her surprise, Siddhiben found that Pragna who was not at all interested in reading and writing could do Maths sums excellently well. Siddhiben used her interest in Maths and led her to reading and writing. Under Siddhiben's guidance, Pragna started with letters, words and with the passage of time she acquired fluency in reading flawlessly. It was like a test for the teacher and Pragna's reading fluently and with interest was the fruit the teacher's hard work bore.

And today when in the Saturday morning assembly, Siddhiben saw Pragna reading the newspaper fluently, she realized that it was her hard work that had borne fruit.

Siddhiben Shah is basically a computer engineer but her love for social work, especially in schools brought her to work in Utthan. The students studying in Adani Foundation and in the schools under the Utthan Project salute her dedication.

Swavlamban :
Pathways to become Self Reliant !!

Mina Ben is resident of Baroi village. She is widow and living with his two children who are studying in school. Adani foundation is coordinating with Jilla samaj Surakha department for availing various benefits of Government of Gujarat to widow women, differently abled and senior citizens of Mundra, Mandvi and Anjar Taluka. We did all procedure for Mina Ben for regular pension scheme.

Mina Ben was ready n passionate to start Gruh Udyog with loan support with 40 percent subsidy by Vajpayee Bankable scheme "With our efforts she got loan and now she will start Gruh Udyog of " Aggarbatti " with pre defined marketing linkages with Ashapura temple trust.

Swavlamban : Pathways to become Self Reliant !!

Adam Bhai Bayad is living at Moti Khakhar Village He is differently abled and having wife and two children in his family. He is having one skill of mobile and computer repairing.
As per his request we allotted him one cabin for income generation. Now he is started to sale Mobile, Mobile accessories. Additionally he started repairing mobile and computer. By hard work he started earning considerable amount. Adam Bhai says "due to this support my children can study well and my quality of life is enhanced

Parvina ben is Divyang but strong lady. She is educated and use to work as a teacher primary school. She was using sticks to reach school. Adani Foundation had given support of tricycle for her comfortable transport.
She says "Adani Foundation is working as a great facilitator for needy people. This is true social work which has created very good imprint in heart of village people. God bless !

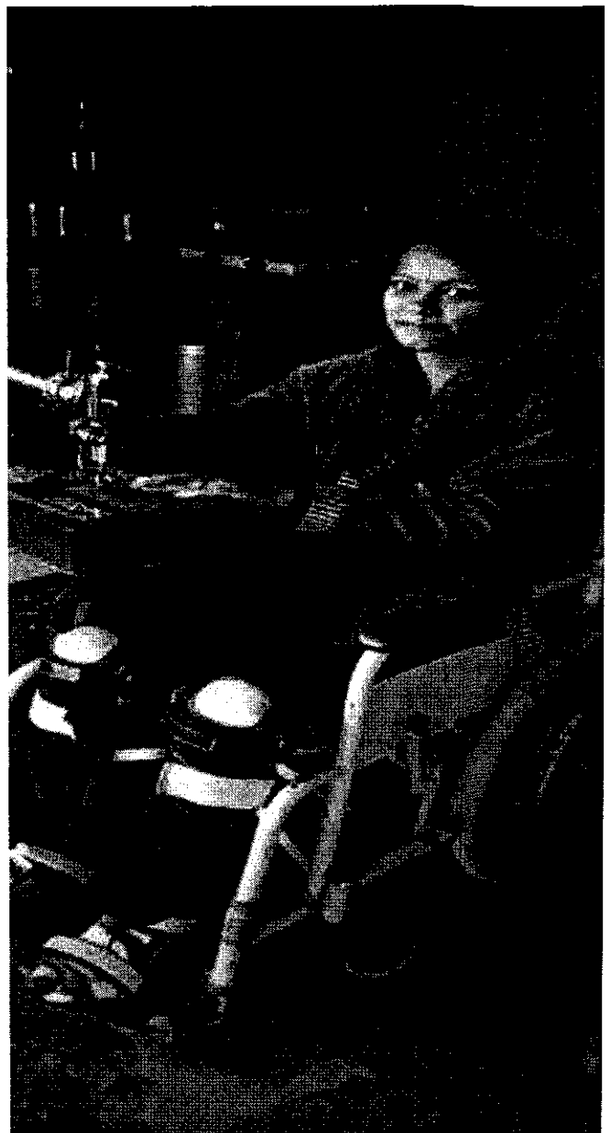
Swavlamban : Pathways to become Self Reliant !!

As the wheels of her sewing machine keep moving, so as the dreams of a better life and empowerment enthuse Bhanuben overcome the physical deformities which came in the form an injury in the spinal cord during childhood. Both her legs were malfunctioned forcing dependence on calipers for movements.

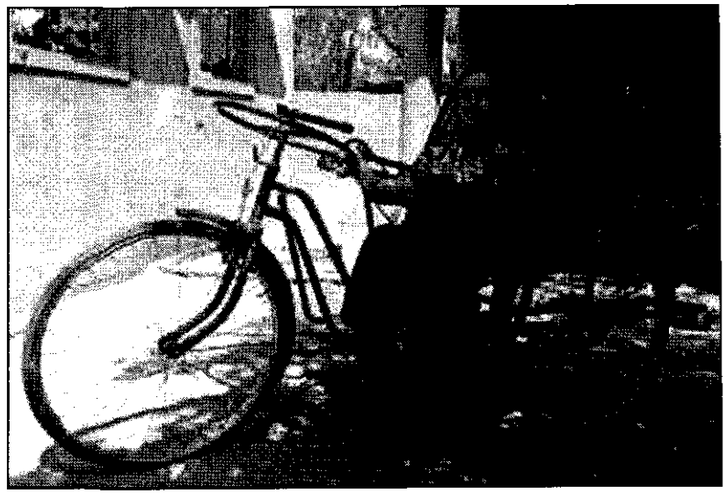


Bhanuben Gangji Patariya of Bhujpur village lost her father when she was just 15 years old, and had very little understanding of the materialistic world and struggle of life. Poverty in the family compelled Bhanuben to drop school and do small odd household jobs of fellow villagers and sometimes accompany her mother as daily labour.

The sudden transition in life, from most adorable darling of her father to an unnoticed and uncared human being in the society, often disturbed the innocent mind of Bhanuben.

Few months back, Bhanuben had enrolled at Adani Skill Development Centre for stitching training, which she could successfully complete within the deadline due to a strong will power and aspiration to win over all odds in life. During her training period only she learnt about AF's Project Swavlamban and expressed the desire to be part of it.

Followed by proper counselling and guidance for self-sustainability, AF donated her one wheel chair and a sewing machine which helped Bhanuben change her life and build the self-confidence of stitching a bright future for her family. Now she earns an average of Rs. 2500 a month which takes care of the basic livelihood needs of her family.



Wearing a smile of satisfaction on her face and the pride of being self-sufficient, Bhanuben expresses her heart-felt gratitude to AF for standing by her during this critical juncture of life. She has become a ambassador to spread the message of all good works by AF in her locality. She is yet, another success story in the saga of sustainable CSR by AF.

Swavlamban : Pathways to become Self Reliant !!

Her name is Sanjuben. Residing in Vadala village with her Divyang husband and 9 years old son. Her husband is working at one shop and trying for two ends meet. During Divyang Mahiti card Vitran by Mamlatdar office she came to know about project Swavlamban. She meet Kalyan Gadhvi who is community mobilizer in Adani foundation. Kalyanbhai had given information n support for Divyang pension scheme.

Since two years couple is getting pension which amount can be used for further study of their son. Additionally, Adani foundation supported her for tricycle in coordination with district social welfare department. Sanjuben is daily using tricycle to give tiffin to her husband. Small linkage can bring life transformation !!!

Spruha : Motivating fisher folk for bright future !!

Fakir Mamad Hasan Vagher

24 year old from poor fisherman family was selected by AF To provide cricket coaching last year. he has completed successful training at Rajkot YB sport academy with excellent performance even in Kutch 23 selection. The YB academy organized honor ceremony and invited AF. On this occasion dignitaries and more than 400 peoples were present and they all appreciated noble support by Adani Foundation.

Fakir Mamad saying that he was playing on behalf of other team and earn RS 500 to 600 but after cricket coaching he get status and honor in Kutch cricket even in society and earn Rs 1500 to 2500 for each match.

2578 2878

Sparuha : Motivating fisher folk for bright future !!

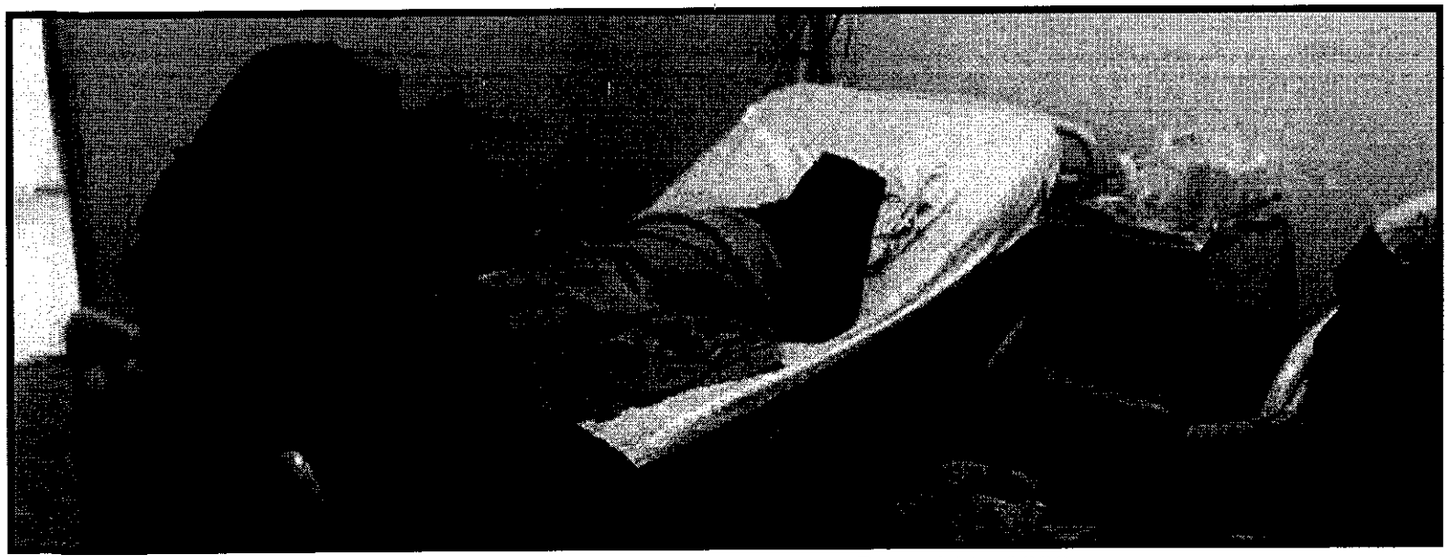
Mamad Sakil Osman Ghani Adani Vidya Mandir – Bhadreshwar 'A High Leap by a Poor Child from the Fisher folk Community.....Towards Engineering Studies.....Through Adani Vidya Mandir' 2017-18 Name: Mamad Sakil Osman Ghani Father's Name: Osman Ghani Mother's Name: Halimaben Family: Brother (1) + Sisters (4) & Parents; total 8 members Occupation: Fishing Village: Luni; Taluka: Mundra; District: Kutchh In modern times along with its importance, education has also made changes in our lifestyle.

Adani Vidya Mandir, Bhadreshwar, is like a lighthouse giving a ray of hope in remote areas. It was established to provide education to children from socio-economically backward communities. The school provides high-quality education, nutritious food as well other kinds of facilities so that children's self-respect increases through the education. Speaking of students, Mamad Sakil was enrolled in the Std. 7, in 2014-15 in the Adani Vidya Mandir, Bhadreshwar. His father, Osman Ghani, is a fisherman. His family of eight members consists of his mother, his father, a brother and four sisters. They live in Luni Bandar.

From the beginning it was seen that he was a quiet, straightforward, humble and cultured boy. He also exhibits behavior with moral values. Everyone helped the family socio-economically. In the Adani Foundation with the help of Vijayhai and Ishwarbhai noted details of the family and found that nobody was educated. In such times of rising prices and inflation it is difficult to raise so many children. So the school management decided to take over and fulfil his basic necessities. Efforts for this child's educational success were made including counselling and guidance.

During his first year in the school, he participated in the running competition in the Khel Mahakumbh and came first in the district. In this way, he began to progress in not just education but also other areas. He started getting promoted to the next standard every year and eventually he reached Std. 10. With the help of the school in various ways and his own hard work, he successfully cleared Std. 10 with 77%. He stood second in the school. Now, the journey of his life has really started. He has started to see new and inconceivable dreams for his future career. Now, the Adani Foundation will be holding his hand to fulfil his dreams.

After completing studies of the Std. 10, he was gifted an android phone by the school principal, Smt. Lali madam, as he needed new technology to get admission for further studies. In this way all the obstacles have been removed from his career path. He has now taken admission in mechanical engineering in Bhuj Polytechnic, and the Adani Foundation has paid his entire fee. A new innings has started in his life. With his hard work he is making progress step-by-step. He has set a good example for other students. And we all hope that he will eventually become a strong financial support to his family.



Adani Vadil Swasthaya Yojana: Holding Hands !!

Every human being has specific periods of the life wherein the childhood is for fun and the adulthood is spent for the family; remains old age to take care of health

Adani Foundation is holded hands of the senior citizens of Mundra

Manubha and his wife stay alone. Their son and daughters stay separately. They earn their living by grazing cattle. Manubha is having **respiratory disorder.** The source of income is very meager and that to dependent on rain. He had to borrow money from family friends or at times take on interest for taking basic treatment. His wife Shantaba also has blood sugar and hence she also requires medical assistance at times. The couple took **Adani Foundations' *Senior Citizen Health Card*** in 2015 by which they are able to save good amount, which was their medical expense every month.

"Adani Foundations' Senior Citizen Health Card is like a cure to our emotional, physical and psychological problem; in the times when we are completely lonely and handicap at age."....Says both of them while weeping.

2580 2880

Adani Vadil Swasthaya Yojana: Holding Hands !!

Adani Foundation at Bhuj is aware of its social responsibilities to the surrounding community. Madhapar is a village approximately 28 km away from Bhuj wherein resides Aseembhai who was financially, health-wise and socially unstable until he availed help from AF at G K General Hospital Bhuj. Aseembhai settled in Madhapar 30 years ago. before 8 years, he lost his wife to heart attack.

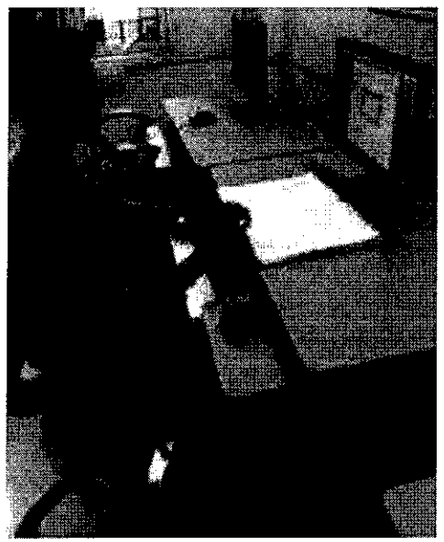
His parents passed away when he was 3 years of age and the only surviving relative he could call his own was his brother who was also mentally-challenged. His problems did not end there as e suffered from high blood pressure and stress induced thyroid which required he took medication as long as he lived.

Slowly his body stopped reacting to the medicines and these did not work. One He got convulsions as a side effect of over dose of medicine. His neighbors took him to Adani G K G H Hospital. Adani Foundation staff took very good care of Aseembhai. For one month he admitted to hospital and daily staff members ask about his health.

When he got discharged he said

"Adani is Like my Second Son.. I get the services even without asking for it"

Saksham Superhero's : Skill Development



My father is a working as a mechanic in ST workshop and his income was not sufficient for live life better so my mother also was working in different fields. I also was trying to find job for support to my family financially. One of my friends suggested me to visit Adani Skill Development Centre – Bhuj and join General Duty Assistant. When I visited center I got all the GDA related information from the staff, I took admission. During this course I learnt lots of Medical related things from the faculty I also was taught about Personality Development, Computer basics, Basic English, Interview Skills. During my practical for 1(one) month in GAIMS, I got chance to work in 4(four) wards. During my practical I learnt many things. After completing GDA course ASDC SAKSHAM is arrange interview At Adani GAIMS Hospital Bhuj. I attended interview and I was selected for physiotherapy section. I was offered monthly salary Rs.10000/- and join the job. After joining this job, I am glad that now I am a working woman and more then that I can help my family financially. With this job my life has become better than before. I would like to thanks Adani Skill Development Centre to give me this Opportunity and for making me SAKSHAM.

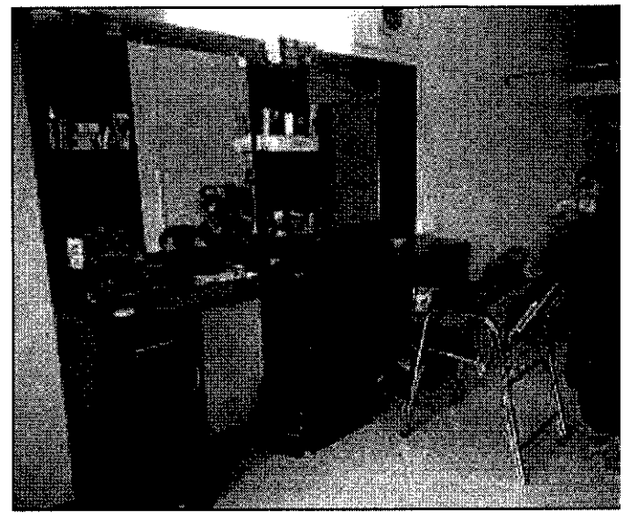
aksham Superhero's : Skill Development

Bhand Navin Devjibhai is very fond of financial autonomy and self-sufficiency, a principle of life which he has got by virtue of his skill development training at Adani Skill Development Centre (ASDC), Mundra. A Commerce graduate from Mundra village, in the year 2017 Navin had enrolled himself at ASDC for the IT-Basic Computer training. He was unemployed and lacked the minimum confidence of facing any job interview as per his qualification.



As part of the well-designed training curriculum at ASDC, the 21-year old youth learnt skills of public speaking, professional manners, facing interviews etc. along with core subject of IT basic computer. The training helped Navin immensely and fetched him a company job with lucrative Rs. 10,000/- per month salary. Happy with his financial autonomy, he is now in a comfortable position to support his parents and three brothers.

My name is Ashok Maheswari from shedata village, Mundra. My father is no more in this world so I was trying to find job for support to my family financially. One of my friends suggested me to visit Adani Skill Development Centre – Mundra and I have joined Checker cum RTG crane operator training for 3 months. After successfully my training I sent my resume in various port. One day I received call from aani port at katupalli in Chennai and I attended interview and I was selected for RTG crane Operator. And today my salary 20,000/- per month.

So, I can help my family financially. With this job my life has become better than before. I would like to thanks Adani Skill Development Centre to give me this Opportunity and for making me SAKSHAM.

Saksham Superhero's : Skill Development

Manisha Patel, from Mundra, has completed Std. 12. Her parents are laborers, earning minimum wages. Manisha had always been a bright student in school, wanting to learn new things. Feeling restricted in life, she dreamt of doing something different. She wanted to have a successful career and be recognized by society. Hence, when she was advised by a close friend to join ASDC's Beauty & Wellness course, which is an NSDC certified course, she grabbed the opportunity. She came to the course with a fresh mind and ready to absorb all the knowledge. She actively participated in all activities. She was full of curiosity and questions, and this attitude enhanced her skills. She was extremely happy when the trainer appreciated her enthusiasm upon completion of the training.

She was delighted to open her beauty parlor. She had also undergone extra training in specific soft skills and business manners in order to handle customers. With these skills, she manages customers like a pro and runs her salon smoothly. Her family members, including her in-laws, were initially hesitant to let her join the course but soon relented upon seeing her enthusiasm and zeal for learning. They are quite proud of what she has achieved in such a short time.

Manisha and Shree Beauty Parlor are synonymous with high-standard beauty and wellness services in the Mundra locality. Her quality services and reasonable prices have increased her popularity and helped in attracting more customers. Today, she earns Rs. 12,000-15,000 per month. Her trainer, Ms. Rekha says, "She and many other candidates who completed their training at ASDC are ambassadors of Saksham. They strive to learn and grow by beating all odds. I am proud to be given this opportunity to groom and create skilled beauticians who can handle the ever-increasing standards of beauty treatments in a city like Mundra. I wish them the very best!"

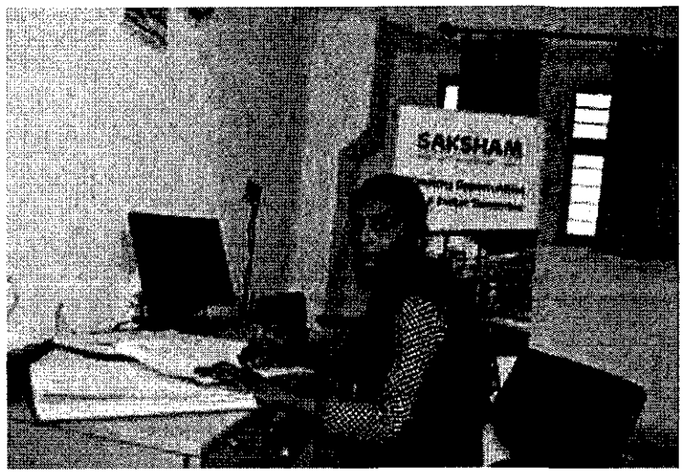
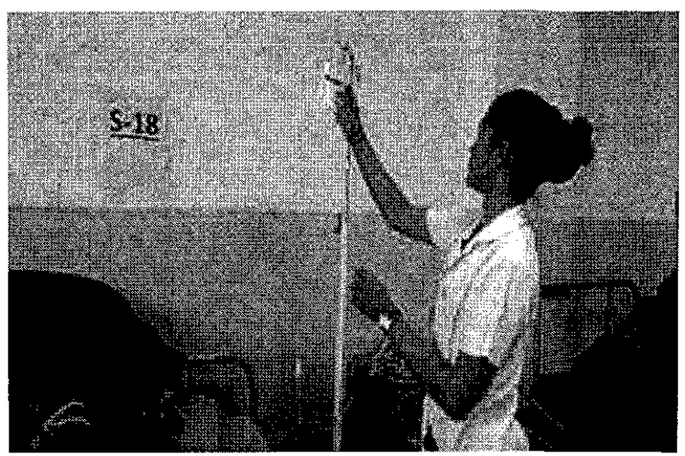
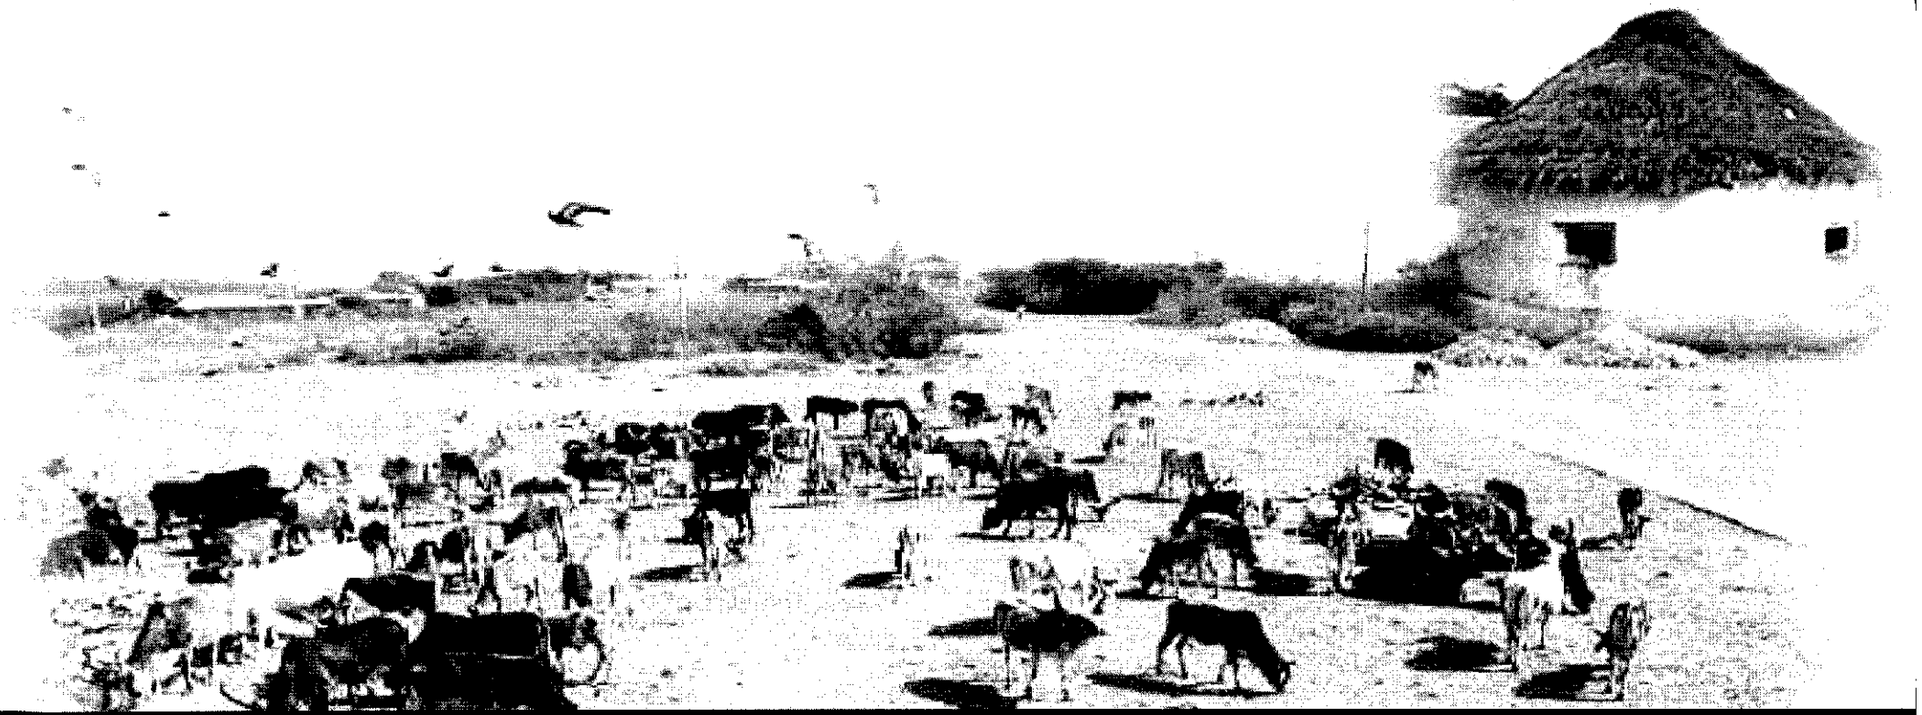
Saksham Superhero's : Skill Development



Lilbai koli- A youngest widow of the general duty assistant (GDA) batch from Adani skill development center (ASDC) Bhuj is an epitome of courage and confidence. She is 22 years old with a one and half year old baby, and lives in a Mirjapur village, Bhuj.



She is 12th pass with Arts stream and used to love drawing and painting as her hobby. Her parents work as laborers and her sister cooks at home. She got married in 2016 and lost her husband in 2018.The most tragic thing is that she didn't even know the exact reason of her husband's sudden death. Happiness is transient, she faced many problems starting with loosing her husband, becoming single parent and loosing financial support from her in-laws which resulted in returning to her parents home.



When asked about her future plan she says "Talking about remarriage is a taboo in our village and culture. I want to be strong enough to work hard and give my son a healthy and happy Life".

Presently, Lilmai is pursuing her ,On the Job Training in G.K General Hospital. A girl who has never seen hospital is now learning technicalities of patient care in emergency ward.

A young novice is all set to become a successful patient care assistant with a single goal in life i.e 'To become economically stable enough to educate her child'. Lilbai expresses huge gratitude to Adani Foundation and ASDC Bhuj for giving her opportunity to study GDA course and help her get the job so that she no longer have to depend on anyone's help for herself or her child's future.

Sub: **Annual Updating of Oil Spill Contingency Response Plan (Tier 1) – APSEZ, Mundra**

Dear Sir,

The Oil Spill Contingency Plan was approved vide your letter no 7563 dated 07th November 2016.

The annual updating of Oil Spill Contingency Plan was done on 01 Oct 2018. The details of changes incorporated are mentioned below:

Sl No	Amendment	Page No
1	Shore line resources updated	26
2	Annex 3- Tug details updated	75
3	Annex 4- Contact details of APSEZ personnel updated	78

The above is for your kind information and updating your records.

Thanking you,

Yours faithfully,

For Adani Ports and SEZ Ltd

Section 03: Strategy

1 Introduction

1.1 Authorities and responsibilities
1.2 Coordinating committee
1.3 Statutory requirements
1.4 Mutual aid agreements
1.5 Geographical limits of plan
1.6 Interfaces with ROSDCP and NOSDCP

2 Risk assessment

2.1 Identification of activities and risks
2.2 Types of oil likely to be spilled
2.3 Probable fate of spilled oil
2.4 Development of oil spill scenarios including worst case discharge
2.5 Shoreline sensitivity mapping
2.6 Shoreline resources, priorities for protection
2.7 Special local considerations

3 Response strategy

3.1 Philosophy and objectives
3.2 Limiting and adverse conditions
3.3 Oil spill response in offshore zones
3.4 Oil spill response in coastal zones
3.5 Shoreline oil spill response
3.6 Storage and disposal of oil and oily waste

4 Equipment

4.1 Marine oil spill response equipment
4.2 Inspection, maintenance and testing
4.3 Shoreline equipment, supplies and services

5 Management

5.1 Crisis manager and financial authorities
5.2 Incident organization chart
5.3 Manpower availability (on-site, on call)
5.4 Availability of additional manpower
5.5 Advisors and experts – spill response, wildlife and marine environment
5.6 Training / safety schedules and drill / exercise programme

6 Communications

6.1 Incident control room and facilities
6.2 Field communications equipment
6.3 Reports, manuals, maps, charts and incident logs

Action and operations

7 Initial procedures

- **7.1** Notification of oil spill to concerned authorities,
- **7.2** Preliminary estimate of response tier
- **7.3** Notifying key team members and authorities
- **7.4** Manning Control Room
- **7.5** Collecting information (oil type, sea / wind forecasts, aerial surveillance, beach reports)
- **7.6** Estimating fate of slick (24, 48, 72 hours)
- **7.7** Identifying resources immediately at risk, informing parties

8 Operations planning

- **8.1** Assembling full response team
- **8.2** Identifying immediate response priorities
- **8.3** Mobilizing immediate response
- **8.4** Media briefing
- **8.5** Planning medium-term operations (24, 48 and 72 hour)
- **8.6** Deciding to escalate response to higher tier
- **8.7** Mobilizing or placing on standby resources required
- **8.8** Establishing field command post communications

9 Control of operations

- **9.1** Establishing a Management team with experts and advisors
- **9.2** Updating information (sea, wind, weather forecasts, aerial surveillance, beach reports)
- **9.3** Reviewing and planning operations
- **9.4** Obtaining additional equipment, supplies, manpower
- **9.5** Preparing daily incident log and management reports
- **9.6** Preparing operations accounting and financial reports
- **9.7** Preparing releases for public and press conferences
- **9.8** Briefing local and government officials

10 Termination of operations

- **10.1** Deciding final and optimal levels of beach clean-up
- **10.2** Standing down equipment, cleaning, maintaining, replacing
- **10.3** Preparing formal detailed report
- **10.4** Reviewing plans and procedures from lessons learnt

Data Directory

Maps / Charts

1. Coastal facilities, access roads, telephones, hotels etc.

2. Coastal charts, currents, tidal information (ranges and streams), prevailing winds
3. Risk locations and probable fate of oil
4. Shoreline resources for priority protection
5. Shoreline types
6. Sea zones and response strategies
7. Coastal zones and response strategies
8. Shoreline zones and clean up strategies
9. Oil and waste storage / disposal sites
10. Sensitivity Maps/ Atlas

Lists

1. **Primary Oil spill Equipment:** booms, skimmers, spray equipment, dispersant, absorbents, oil storage, Radio communications etc. (Manufacturer, type, size, location, transport, contact, delivery time, cost and conditions)
2. **Auxiliary Equipment:** Tugs and work boats, aircraft, vacuum trucks, tanks and barges, loaders and graders, plastic bags, tools, protective clothing, communication equipment etc. (Manufacturer, type, size, location, transport, contact, delivery time, cost and conditions)
3. **Support Equipment:** Aircraft, communications, catering, housing, transport, field sanitation and shelter etc. (Availability, contact, cost and conditions)
4. **Sources of Manpower:** Contractors, local authorities, caterers, security firms (Availability, numbers, skills, contact, cost and conditions)
5. **Experts and Advisors:** Environment, safety, auditing (Availability, contact, cost and conditions)
6. **Local and National Government contacts:** Name, rank and responsibility, address, telephone, fax, telex.

Data

1. Specifications of oils commonly traded
2. Wind and weather
3. Information sources

Annexures

Annexure 1	Initial Oil Spill Report
Annexure 2	POLREP Report
Annexure 3	List of resources available
Annexure 4	List of Telephone numbers of Expert and advisors
Annexure 5	Responsibilities: Marine Officer / SPM Officer
Annexure 6	Responsibilities: Marine Manager / On Scene Commander
Annexure 7	Responsibilities: SPM Pilot
Annexure 8	Responsibilities: HOD – Marine
Annexure 9	Oil Spill Progress report
Annexure 10	Emergency response Log
Annexure 11	Classification of oils
Annexure 12	Response Guidelines
Annexure 13	Site Specific Health and Safety Plan.
Annexure 14	Indian Chart 2079
Annexure 15	List of recycler approved by state of Gujarat
Annexure 16	List of agency for support & guidance for rescue & rehabilitation of oiled bird & mangroves management during oil spill

Strategy

1. Introduction

The movement of Petroleum/ Petroleum-products from the production centre in middle east to Adani Ports and SEZ Ltd and various other ports in Gulf of Kutch is handled through ships at sea and to refineries using pipe lines on ground. Like any other port, Adani Port is very much vulnerable to oil spill disaster arising due to collision, leakage or grounding of vessels in sea and damage to pipelines on ground.

This action plan prepared by Adani Ports and SEZ Ltd, Mundra is to combat the oil spill (LOS-DCP) is in accordance with the NOS-DCP, International Petroleum Industry Environmental Conservation Association (IPIECA).

1.1 Authorities and responsibilities

Adani Ports and SEZ Limited

APSEZL has responsibility for dealing with oil spillages which occur within port limit if the estimated quantity of product lost is 700 tons or less.

Should the spill migrate to other areas, the Coast Guard Monitor will assume the position of On Scene Commander and will direct the response effort. In both cases, APSEZL will act and deploy their resources as required by the relevant On Scene Commander.

This operational version of Oil Spill Contingency Response Plan for the Adani Ports and SEZ Ltd, Mundra is intended for use by all such personnel like Marine Personnel, Tug Masters and all others as indicated in the Spill Response Organization who may be involved in the response to oil spills which may occur within Adani Port Limits.

This plan has been prepared as per the stipulation of Ministry of Environment and Forest Clearance (MoEF) and Coast Guard Requirements.

Gujarat Maritime Board

While responsibility for oil spill contingency remains with conservator of the port – Gujarat Maritime Board Port Officer, this plan (Tier 1) demonstrates the readiness of Adani Port for mitigating oil spill incidents.

Port Conservator will monitor and provide the necessary assistance required for administering the oil spill operation within the port limit.

Indian Coast Guard

The Indian Coast Guard has a statutory duty to protect the maritime and other national interests of India in the Maritime Zones of India and to prevent and control marine pollution. Coast Guard is also the Central Co-coordinating Authority for marine pollution control in the country. The Indian Coast Guard is responsible for implementation and enforcement of the relevant marine pollution laws.

The National Oil Spill Disaster Contingency Plan stipulates the organizational and operational details to effectively combat a national oil spill contingency. The plan promotes the development of Regional and Local Contingency Plans in the three Coast Guard Regions.

The Coast Guard Monitor will assume the role of On Scene Commander in the event that any oil spill involving PLL operations exceeds 700 tons.

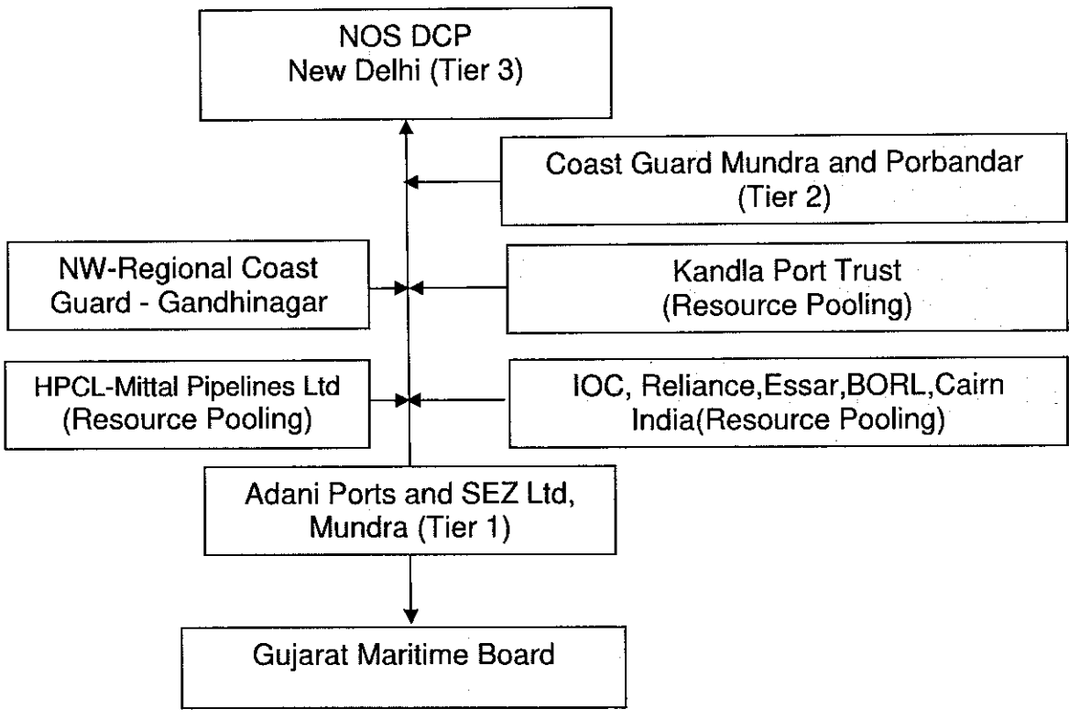
Gujarat Pollution Control Board

The Gujarat Pollution Control Board is responsible for, and control, waters up to 5 km from the shoreline. They require to be advised of all pollution incidents.

Ministry of Environment, Gujarat

The Ministry requires to be informed of all pollution incidents.

Emergency Response Team



Emergency Response Team (ERT) is the nomenclature used to describe the command and control team established for an oil spill incident at the jetty or in the jetty approaches, with representatives of organisations attending as described in section 2.4.

The ERT will convene at the Terminal Control Room, under the chairmanship of the Terminal Manager, and will consist of a Management Team and a Support Team as noted in section 2.3.

It is a strategic plan to quickly call on additional resources in a systematic manner firstly from Adani port and subsequently from other ports.

2962

1.2 Coordinating Committee

1.3 Statutory requirements

The Indian Government is a signatory to the International Convention on Oil Pollution Preparedness, Response and Co-operation which came into force in May 94. Under the NOSDCP, it is obligatory for a port to have a Local Oil Spill Contingency Plan to combat oil spills within port limits.

This oil spill contingency response plan (Tier 1) is the response plan in accordance with the facilities available at Adani Port only.

This plan is prepared in accordance with:

a) Marine Environmental Impact Assessment of SPMs, COTs and connecting pipelines of APSEZL at Mundra dated February 2001, prepared by National Institute of Oceanography, Mumbai.

b) Report on Risk assessment study and On-site disaster management Plan for SPMs, COTs and connecting Pipelines of Adani Ports and Special Economic Zone Limited, by TATA AIG Risk Management Services Limited, dated February 2001.

c) HAZOP study report of SPM Terminal pipeline project by Intec Engineering, dated 26/02/2004.

d) IPIECA guide to Contingency planning for oil spills on water.

e) Oil spill risk assessment and contingency plan study done by M/s Environ Software Pvt. Ltd. (Copy enclosed)

1.4 Mutual aid agreements

APSEZL signed MOU with HPCL Mittal Pipelines Limited, Mundra operating in the region of Gulf of Kutch to have mutual aid agreement for the purpose of assisting each other within stipulated time frame with best combination of resources to combat and overcome any large and worst spill with the intent of maximizing the availability of the private, public and government sector response resources during oil spills where assistance is requested by another member.

As per agreement, the member agencies of the affected member state or province may directly request cascadable response resources located in oil handling agencies operating in the region of Gulf of Kutch.

1.5 Geographical limits of plan

Adani Ports and SEZ Ltd, Mundra is situated at the North head of Gulf of Kutch which is at the west coast of India. Ships calling Adani Port therefore have to traverse across the GOK. This oil spill contingency response plan (Tier 1) is applicable for the following:

1) Loading and Unloading of liquid cargo at the Multi-purpose terminal jetty at the Adani Port.

2) Unloading of the crude oil the vessels at the single point mooring (SPM) to offload 70,000 to 3,00,000 DWT.

3) Bunkering operations carried out within the port limits.

4) Any spill that occurs from any source within port limit (including West Basin, South Basin and LNG Terminal) whether at berths, anchorages or in the channel.

APSEZL falls within the area jurisdiction of The Commander, No.1 Coast Guard District (Gujarat), located at Porbandar. Mundra has a full-fledged Indian Coast Guard Station. The Port limit of APSEZL, Mundra is shown in enclosed chart in annexure 14.

1.6 Interface with ROSDCP and NOSDCP

For responding to oil spill, the Indian Coast Guard has developed the National Oil Spill Disaster Contingency Plan NOSDCP which has the approval of the Committee of Secretaries and has been in operation since 1996. The NOSDCP brings together the combined resources of the various organizations and departments, Coast Guard, Ports and Oil handling Agencies, and related industries, to provide a level of preparedness to the threat posed to the marine environment by oil spills.

The NOSDCP sets out a clear definition of the responsibilities of the major participants, such as the Coast Guard, various ministries and departments, ports and oil industry.

The national oil spill contingency plan hierarchy outlined in Figure 1 consists of NOSDCP at the apex level to coordinate significant or disaster type spills, the Regional Oil Spill Disaster Contingency plan (ROSDCP) to coordinate spill in the Gulf of Kutch, utilizing the resources available within the region.

2964

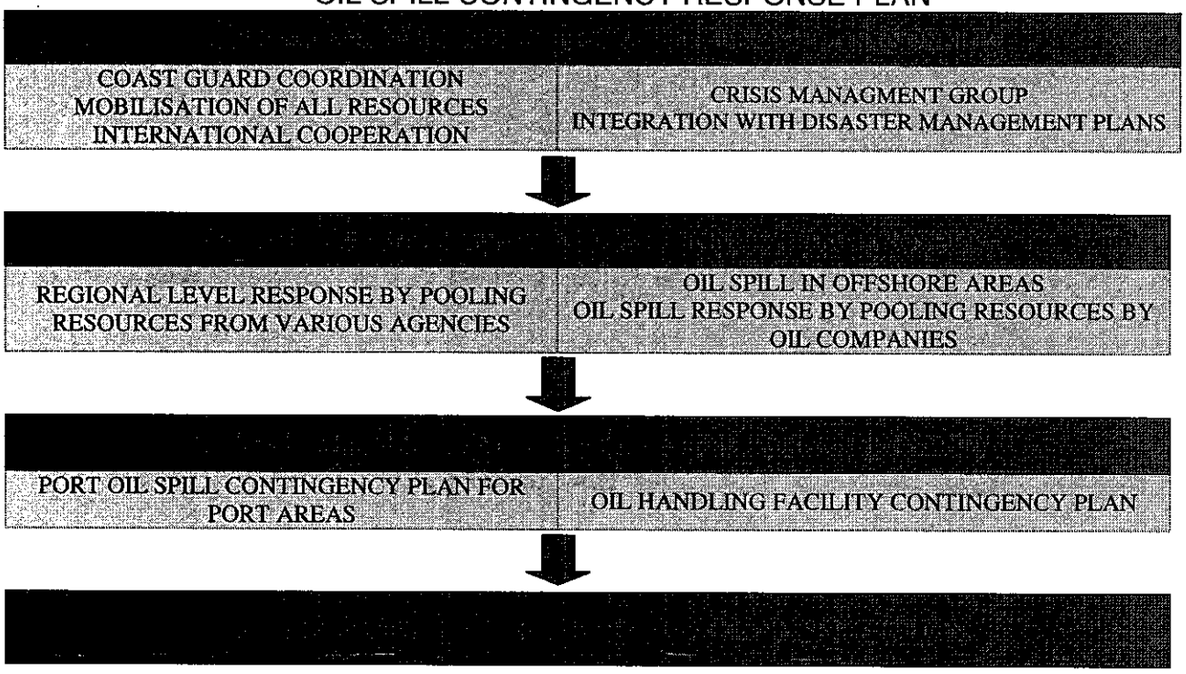


Figure 1 - Contingency Plan hierarchy

The aim of Local Contingency Plan - for the Mundra Port, is to outline arrangements for responding to oil spills in the coastal and shoreline areas, with the aim of protecting against environmental pollution as a result of oil spill or, where this is not possible, minimise the effect and respond the oil spill in an environment friendly manner and dispose the collected oil/debris in according to the existing laws/regulations/orders in force. CONTINGENCY PLAN FOR SHORELINE PROTECTION
ISTRICT OIL SPILL CONTINGN

2 Risk Assessment

The number of vessels calling annually at APSEZL is more than 3000 including Chemical and oil tankers. The threat of oil spill is much high in Gulf of Kutch and is very oil spill sensitive area. A marine national park is located in the Southern shore of GOK. There is a popular beach spot on the Northern shore namely Mandvi. Lastly, as GOK is a closed system, any oil spilled will arrive to the shores.

2.1 Identification of activities and risks

The scenario of the spill are classified under two categories :

- Oil Spill at Mundra Port Multi-Purpose Terminals
- Oil Spill at SPM

The oil spill could occur due to various reasons at any of the APSEZL's marine facilities (SPMs, Basins/ berths, anchorage or approach channel) within the new Mundra Port limit. The spills beyond these areas are not covered in this plan. Both the categories are discussed in detail

Accidental oil spill at Multipurpose terminals/ Basins/ berths, anchorage or approach channel is possible from overflow of slop tanks, bunker tanks, reception facility and road tankers (generally a low pressure operation).

Accidental oil spill at the SPM may be due to hose puncture while unloading, failure of swivel joint of SPM or Leakage of Crude Oil at PLEM or from the submarine pipeline.

Following risks are being addressed to mitigate incident of oil pollution:

- Connection of hoses with established work instructions for use of blank flanges, drip trays etc.
- Thorough understanding of use of OSD and limitations of vessel surging due to slack mooring ropes in given weather conditions.
- Monitoring of ships pump room atmosphere, display of fire notices and acknowledging accidental explosion through the use of IMO ship / shore check list.
- Spillage of F.O. during bunkering operations by using bunkering check list
- Ballast discharge contamination or malfunction of ship's sea side valves by prohibiting such operations without written permission of the port.
- Non use of reception facility of the port by ships on cost plus basis.

Operational leakage

Spill due to floating hose failure at SPM: (183 t, at pumping rate of 10000 m^3/h of crude oil for 75 sec): (Spill points - S1 at HMEL SPM & S2 at Mundra SPM)

Crude oil pumping rate from the tanker to the shore tanks will be varying between 5000 m^3/hr and 10000 m^3/hr. In the present study, the maximum pumping rate of 10000m^3/hr has been considered to assess the risk on a higher side. The Safety Break Away Coupling in the crude oil transfer hose will be activated within a few seconds in the event of hose rupture or hose failure. Again for the sake of assessing higher risk, a response time of 60 sec – 75 sec (worst case scenario) is considered to estimate the amount of oil that would spill at the SPM. Thus the quantity of crude oil spill has been estimated to be a maximum of 183 tons in the event of hose failure or rupture.

Spill due to rupture of sub-sea crude oil pipeline from SPM to shore tanks: (384 tons of crude oil, at pumping rate of 10000 m^3/hr for 60 sec): Spill point S3 taken at midpoint of the pipeline from HMEL SPM to LFP)

Crude oil pumping rate from the tanker will be in the range of 5000 m^3/hr to10000 m^3/hr. In the present study, to assess the maximum risk, pumping rate of 10000 m^3/hr has been considered. The minimum wall thickness of sub-sea crude oil pipeline is 15.6 mm and the maximum thickness is 24 mm. Moreover all along, 5 inches concrete cladding (weight coating) is provided on the surface of the pipeline. Crude oil pipelines designed, constructed and laid as per the international norms are safe and leakages are extremely rare during their designed life. However, a rupture of size 1 cm x 12.7 cm has been assumed for assessing the quantum of oil spill through sub-sea pipeline.

The maximum manifold pressure will be 12 kg/cm^2 and crude oil will be pumped to the shore tanks without any boosting device in-between. As the level in the tanker depletes, discharge pressure would also be reduced. Moreover, with the flow distance the crude oil pressure inside the pipe drops. For the sake of assessing the amount of oil spill in case of rupture of sub-sea pipeline, an average pressure of 10 kg/cm^2 and a water column height of 35 m have been considered.

Accordingly the quantity of Crude oil spill has been estimated using the formula given by

$Q = C_d A (2gH)^{1/2}$

Where,

Q = quantity of spill (m^3/s)

C_d = coefficient of discharge (0.9)
A = Area of rupture (m^2) (1 cm x 12.7 cm)
H = Net head (m) (6.5 kg/cm^2 = 65 m)

This would give a value of 0.04 m^3 of crude oil per sec spilling out of the pipeline through the rupture as the pump will be in operation.

The availability of solenoid operated hydraulic shutoff valves in the sub-sea pipeline, which will get activated in less than 15 seconds time as soon as the pressure falls, will limit the amount of oil leaked in case of pipe rupture and consequent drop inside the pipeline. However 60 sec response time has been considered for quantification of oil spill. Accordingly the quantity of Crude oil spill has been estimated to be 2.4 m^3 before the pump discharge valve closes. However, there will be high pressure inside the pipeline initially and the oil inside the pipeline will start leaking into the waters through the hole as the pressure inside the pipe line is higher than the outside pressure, even after the valve is closed and pumping is stopped. Even after the pipeline inside pressure equalises the outside static pressure acting on the rupture, oil continues to start leaking as the density difference between the oil and water; oil being lighter and LFP is higher in elevation compared to the pipeline elevation. Two factors need to be considered here; the specific gravity of the crude oil inside the pipeline is less than 1 whereas the sea water specific gravity is more than 1. Also depending on the location of the hole/leak, there will always be a static head of sea water acting on the leak when the oil tries to flow out and sea water trying to flow in to occupy the place vacated by the leaked oil. Hence all the oil in the pipeline will not leak and there would be an equilibrium point reached when there would be no more oil leaking from the hole as the sea water pressures effectively blocks the oil leak. Also, the leak would be attended to within the stipulated time as per the standard maintenance procedures followed by the organisation. For the purpose of this study and as a worst case scenario before the leak is repaired by the established maintenance procedures, it is assumed that a maximum of 5% of the pipeline oil volume would leak and though it would be a continuous leak, this total quantity is taken to be instantaneous for the purpose of the study.

The pipeline length is approximately 10 km (from SPM to LFP) and the pipeline size is 42" NB. The pipeline volume works out to be approximately 8662 m^3 or 7622 t.
Hence the total oil leaked due to rupture in sub-sea pipeline will be 2.15 t + 5% of pipeline volume of oil in t (0.05 x 7622 =381 t) which works out to be a maximum of 383.45 t, say 384 t of crude oil.
For the purpose of simulation studies, this spill on the pipeline is assumed to have taken place at the midway point from HMEL SPM to LFP (designated as spill point **S3** in the report) and is taken on the sub-sea pipeline from HMEL SPM to LFP. As the pipeline from HMEL SPM to LFP and the Mundra SPM to LFP run very close only one leak point in the pipeline is studied as it gives a representative oil spill study for the pipeline leakage scenario.

Spill due to collision at SPM: (Spill points S1 & S2)

Crude Oil is received at SPM by ocean tankers having capacity between 90,000-360,000 metric tons. Crude Oil is pumped to shore tanks through pipeline/s from the SPM. In the present scenario, collision of the vessel at the SPM or tanker route with another vessel enroute to other terminals can cause partial damage to the vessels cargo tanks (not more than 3 nos. of cargo tanks) leading to a maximum oil spill of about 700 tons to 25,000 tons of crude oil. In the present study, the probable quantity of crude oil spill due collision at SPM is considered as 700 tons at the minimum and as 25,000 tons at the maximum.

Spill due to collision or grounding in the tanker route: (Spill point S4)

Tankers are expected to call at the SPMs frequently depending upon the demand for the refineries for the crude oil. These tankers may meet accidents like collision with other vessels or grounding in the vicinity of the SPM. In case of such accidents, the spillage may vary depending on the size of the tanker and the extent of damage and number of cargo tanks ruptured etc. In the present study the probable quantity of spill in the tanker route considered for modelling is 25000 tons at a point which lies on the tanker route to SPM not exactly within Mundra port limit; but a spill point is taken along the tanker route in the Gulf but close to the Mundra port limit.

Spills at the berths (applicable to berths at West Basin, South Basin, East Basin, North Basin, LNG berth and existing cargo berths of Mundra port.)

Oil spills can take place at the berths in the basins during the loading / unloading as well as berthing and traversing operations. The likely spill scenarios are discussed below:

a) **Spills during the navigation of the vessel along the approach channel: (Spill point S7 for West Basin)**
The spill location can be anywhere in the path. One location along the approach path has been selected for carrying out for model runs.

b) **Spills around the jetty (in the maneuvering basin / turning circle): (Spill point S6 for West Basin and Spill point S10 for South Basin)**
This can occur due to tug boat impacting the vessel and grounding of the vessel. One location around the jetty at the turning circle has been considered for the computational runs

c) **Spills at the berths: (Spill point S5 for West Basin, Spill point S9 for South Basin, Spill point S13 for East Basin, Spill point S14 for North Basin, Spill point S8 for LNG jetty, Spill point S11 for MMPT 1 and Spill point S12 for MICT / AMCT berth locations)**

During the loading/unloading operations spills may take place due to one or more of the following: –

Hose/ loading arm leakage (liquid products handled at the liquid berth), overflow on the vessel deck, vessel grounding at the jetty, vessel colliding with jetty, fire and explosion on the vessel or at the jetty, during bunkering operations etc.

Spills along approach Channel / Route

Vessels to the port berths follow the Deep Water route in Gulf of Kutch and Pilot boards at Pilot Boarding Ground "A" or "B", subject to tide and the berth allotted to the tanker.

While the risk of grounding is low, it cannot be wholly eliminated; the most likely causes are steering or propulsion system failure or navigational error, any of which could result in grounding on the channel margins. Given that the bed of the Gulf is rocky at some places the likelihood of any significant hull damage cannot be ruled out. In a general case scenario, weld fractures in the forward bunker tanks could give rise to a release of approximately 10 Tons of diesel oil and in a worst case scenario extensive damage to the bunker tanks may occur which would cause a spill of 500 to 700 t of FO spill.

Collision

The risk of collision while transiting the channel is negligible given the reason that port authorities use sophisticated ship tracking and navigational systems as the Gulf traffic has increased. These systems would ensure that the chances of any collision are remote or non-existent when ships / marine craft traverses / transits through the channel. However, even if any collision occurs, it is beyond reasonable

doubt that such an incident would result in the fore part rather than the parallel mid-body of the vessel and the loss of integrity of hull plating of a cargo tank is most unlikely. A spill quantity of 700 t can be the maximum in such a scenario.

Berthing Incident

Oil and/ or liquid chemical spill can occur as a result of hull coming in contact with the corners of the jetty structure during ship berthing or un-berthing maneuvers. Such incidents are generally due to failure of a

vessel's main propulsion or steering systems, loss of control onboard on support tug in attendance or Master error or wrong judgment.

The potential spill quantities involved depend on the vessel type and the location and extent of the impact damage; hull damage to a 20000 DWT – 80000 DWT tanker / vessel in way of a forward or aft wing tank, for example, could give rise to a release of some 500 Tons of product. The potential spill quantity, should hull plating be ruptured in way of an aft wing diesel oil bunker tank can, historically, be up to 100 Tons.

Tug Impact

There are well-documented incidents where cargo or bunker oil has been released as a result of hull impact damage by tugs. This can occur when tugs are approaching a vessel underway prior to berthing, or when coming alongside a moored vessel prior to un-berthing. The potential spill quantities again depend on the location and extent of the impact damage but can be over 20 tons for Diesel oil and 100 Tons for cargo (FO) oil. Spills from this cause are considered to be of low likelihood but the risk is acknowledged.

Loading Arms / Flexible hoses

The operation of loading arms / flexible hoses can lead to minor releases of oil. Common sources are vent valves, swivel joints and hydraulic lines. Such spillage seldom exceeds 0.1 Tons.

Cargo Tank Overflow

Cargo tank overflows can occur on board loading vessels; spills of this nature can be due to instrumentation failure, tank valve mismanagement or operator error. The spill quantity is a function of the flow rate and also the number of tanks being loaded at the time of the incident. Some of the oil and/or chemical will be retained on deck but, in a worst case scenario, up to 3 tons could escape overboard.

Hull Failure

The incidence of oil pollution due to hull failure is low and some 84% of the incidents attributed to this cause by ITOPF involved spill quantities of less than 7 tons; these spills were caused mainly by minor hull fractures and weld failures. The potential for more serious incidents with spill quantities in excess of 700 tons must however is acknowledged.

Fire and Explosion

Fires and explosions on board ship represent a safety hazard with the risk of pollution as a secondary impact. Most tankers engaged for trading will be equipped with inert gas systems. Given the controls, which are imposed and enforced by APSEZL authorities in respect of the oxygen content of cargo tanks, the risk of fire and/or explosion in the cargo spaces must be regarded as minimal, insofar as cargo transfer operations are concerned.

Strict monitoring and control of the main cargo pump room atmosphere will minimize the fire and explosion risks associated with this space.

Fires resulting from uncontrolled smoking in the accommodation, unauthorized hot work such as welding, and engine room fires can spread rapidly if not dealt with swiftly and can give rise to incidents of a very serious nature.

While the likelihood of fire or explosion occurring on board vessels berthed at the Mundra port berths is low, the risk is nevertheless acknowledged. Such an incident could give rise to a spillage of 700 tons or more.

Bunkering – spillage of fuel oil

Bunkering at the port may sometimes give rise to spills due to hose failure and / or bunker tank overflow etc. in spite of the strict regulatory supervision of the port operations. These spills could be as small as a few kgs to a maximum of 500 t of FO.

As can be seen from the spill scenarios mentioned above, the spills range from extremely negligible quantities to enormous quantities in rare catastrophic events. The simulation of oil spills does not vary significantly in various scenarios except for the magnitude of impact zone and the quantity involved in such impacts. Though the software is intended to be used for specific scenarios so as to get the trajectory and other weathering information; in this study, a few hypothetical scenarios have been simulated and computations carried out considering the worst-case scenarios of oil spills at the different likely locations in the domain.
Based on the above deliberations, the following scenarios for computations have been selected for carrying out modeling studies for the oil spill trajectory and weathering processes.

Computational Scenarios:

Spill Locations	**Pre-monsoon (Jan)**	**Monsoon (July)**	**Post monsoon (Nov)**
SPM			
Crude oil spill of 183 t at the pumping rate of 10000 m^3/hr (for 75 sec release) at the SPMs (due to Hose failure) Spill points: **S1** and **S2** During spring and neap tide conditions (tide conditions : PF and PE)	▪	▪	•
Instantaneous crude oil spill of 700t at the SPMs Spill points: **S1** and **S2**	▪	▪	•
Instantaneous crude oil spill of 25000t at the SPMs -- Spill points: **S1** and **S2**	▪	▪	•
Pipeline Leakage			
Crude oil spill of 384 t at the pumping rate of 10000 m^3/hr (for 60 sec release) along the pipeline corridor at a select (midway) point of subsea pipeline in the pipeline routes. -- Spill point: **S3**	▪	▪	•
Tanker route			
Instantaneous crude oil spill of 25000t along the tanker route at select location. Spill point: **S4**	▪	▪	•

2970

West Basin (berths)			
100 tons (due to Berthing incident/ collision) at the West Basin berths (FO) Spill point: **S5**	▪	▪	•
50 Tons (due to Berthing incident/ collision (diesel oil tanks) at the West Basin berths (HSD) Spill point: **S5**	▪	▪	•
700 Tons due to Hull Failure / Fire / Explosion (FO) at the berths -- Spill point: **S5**	▪	▪	•
In the maneuvering basin: o 20 Tons of HSD oil due to Tug Impact (HSD) o 100 Tons of FO due to Tug Impact Spill point: **S6**	▪	▪	•
Along the vessel route at one location: Instantaneous oil spill of 700t along the tanker route at a select location.(FO): Spill point: **S7**	▪	▪	•
LNG Berth			
100 tons (due to Berthing incident/ collision) at the LNG berth (FO) -- Spill point: **S8**	▪	▪	•
50 Tons (due to Berthing incident/ collision (diesel oil tanks)) at the LNG berth (HSD) – Spill point: **S8**	▪	▪	•
700 Tons due to Hull Failure / Fire / Explosion (FO) at the berth-- Spill point: **S8**	▪	▪	•
South Basin (Berths)			
100 tons (due to Berthing incident/ collision) at the South Basin berths (FO) -- Spill point: **S9**	▪	▪	•
50 Tons (due to Berthing incident/ collision (diesel oil tanks) at the South Basin berths(HSD) – Spill point: **S9**	▪	▪	•
700 Tons due to Hull Failure / Fire / Explosion (FO) at the berth -- Spill point: **S9**	▪	▪	•
At the turning circle: o 20 Tons of HSD oil due to Tug Impact o 100 Tons of FO due to Tug Impact Spill point: **S10**	▪	▪	•
At the existing MMPT 1 Berth: **: Spill Point S11**			
100 tons (due to Berthing incident/ collision) at the berth(FO) -- Spill point: **S11**	▪	▪	•
50 Tons (due to Berthing incident/ collision (diesel oil tanks)) at the berth (HSD) – Spill point: **S11**	▪	▪	•
700 Tons due to Hull Failure / Fire / Explosion (FO) at the berth	▪	▪	•

At the existing MICT / AMCT Berths: : Spill point S12			
100 tons (due to Berthing incident/ collision) at the (FO) - Spill point **S12**	▪	▪	•
700 Tons due to Hull Failure / Fire / Explosion (FO) at the berth - Spill point **S12**	▪	▪	•
At the East Basin: Spill point S13			
100 tons (due to Berthing incident/ collision) at the East Basin berth (FO) - Spill point **S13**	▪	▪	•
At the North Basin: Spill point S14			
100 tons (due to Berthing incident/ collision) at the North Basin berth (FO) - Spill point **S14**	▪	▪	•

2.2 Types of oil likely to be spilled

Mundra Port mainly deals with Vegetable oils, Furnace oil, Naphtha, Methanol, High Speed Diesel, Super Kerosene Oil and other light oils at its Multi-Purpose terminal. The vessels calling at the port (or the designated anchorage areas) may spill fuel, diesel or a minimal quantity of lubricating oils. The SPM is being used to discharge crude oils from tankers.

At Berths:

- Vegetable oils,
- Furnace oil,
- Naphtha,
- Methanol,
- High Speed Diesel,
- Super Kerosene Oil,
- Carbon Black Feed Stock (CBFS),
- Motor Spirit,
- Other light oils

At SPM:

- Crude oil

At anchorages or within port limits:

- Fuel oil,
- Diesel oil,
- Minimal quantity of lubricating oil.

2.3 Probable fate of spilled oil

APSEZL is all weather, commercial port with geographical and hydrological advantages on the West Coast of India, in the Gulf of Kutch. Tidal range is between +0.37 m during Neaps and + 6.40 m during springs. Tidal streams flow 070^0 – 250^0 at an average rate of 3 kts and 4-5 kts during spring tides.

2972

It has been observed from the modeling study that during pre-monsoon season, the spills occurring at the APSEZL marine facilities move towards the southern / southwestern part of the Gulf of Kutch nearer to the facilities depending on tide phase.

The spills taking place at the APSEZL marine facilities move towards northern coast of Gulf of Kutch during monsoon season and affect the coast near Mundra, Kandla etc.
During post - monsoon season, the spills taking place at the APSEZL marine facilities move towards south / southwest and affect the islands /coast on southern side of the Gulf of Kutch.

The surface or subsurface oil spill consists of slick floating on the water surface, which partially dissolves in the water and partially evaporates into the atmosphere. There is a continuous exchange between the suspended and surface oil (floating oil). The assumption made in deriving the governing equations is that the thickness of the oil layer is negligible in comparison with the water depth.

In addition to the location, size and physico-chemical properties of the spill, other major factors affect the fate of the oil slick are governed by complex interrelated transport (turbulence) and weathering processes (evaporation, emulsification and dissolution). The spilled oil spreads and moves by the forces of winds and currents. A small portion of hydrocarbons begin to go into solution in the underlying water column, but most of the oil is lost through evaporation into the atmosphere. In the present model, all these processes are considered in the transport of Oil Slick.

Out of the above mentioned oils the vegetable or light oils do not pose any significant threat to the environment.

The spilled 'persistent' crude oil (or fuel oil) undergoes a number of physical and chemical changes known as "weathering". The major weathering processes are spreading, evaporation, dispersion, emulsification, dissolution, oxidation sedimentation and biodegradation.

> *The term persistent is used to describe those oils which, because of their chemical composition, are usually slow to dissipate naturally when spilled into the marine environment and are therefore likely to spread and require cleaning up. Non-persistent oils tend to evaporate quickly when spilled and do not require cleaning up. Neither persistence nor non-persistence is defined in the Conventions. However, under guidelines developed by the 1971 Fund, an oil is considered non-persistent if at the time of shipment at least 50% of the hydrocarbon fractions, by volume, distill at a temperature of 340°C (645°F), and at least 95% of the hydrocarbon fractions, by volume, distill at a temperature of 370°C (700°F) when tested in accordance with the American Society for Testing and Materials Method D86/78 or any subsequent revision thereof."*

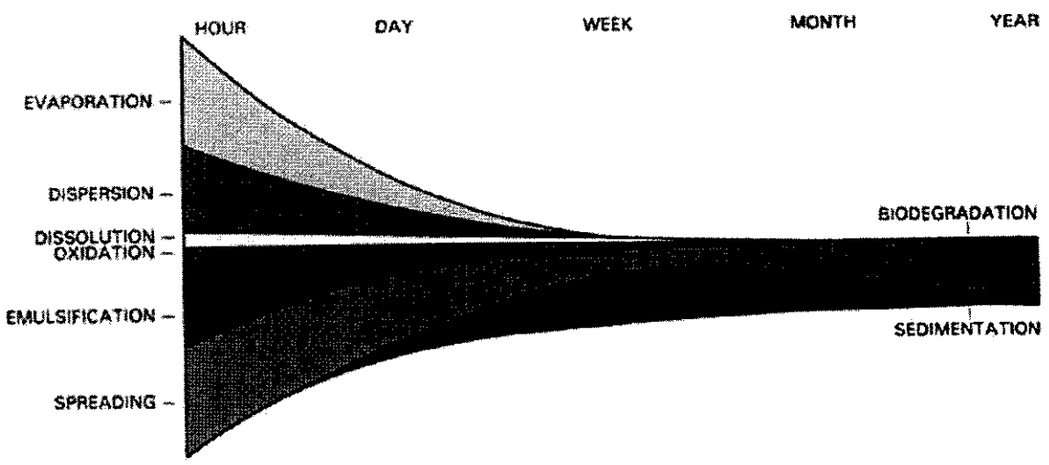
a) **Spreading**: is one of the most significant processes during early stages of a spill is initially due to gravity. The oil spreads as a coherent slick and the rate is influenced by its activity. After a few hours, the slick begins to break-up and after this stage, spreading is primarily due to turbulence. Wind and wave actions also tend to fragment the slick, breaking it up into islands and windrows.

b) **Evaporation**: The rate and extent of evaporation depends primarily on the volatility of the oil. In general, oil components with a boiling point below 200 D C evaporate within 4 to 16 hours in tropical conditions. Spills of refined products such as kerosene and gasoline evaporate completely and light crude lose up to 40 % of its volume within a few hours. In contrast, heavy crude and fuel oils undergo little evaporation.

c) **Dispersion**: Waves and turbulence act on the slick to produce droplets of oil of different sizes. Small droplets remain in suspension while the larges ones rise to the surface. The rate of dispersion mainly depends on the nature of the oil and the sea state. Oils which remain fluid can spread unhindered by other weathering processes can disperse completely in moderate sea conditions within a few days. Viscous oils tend to form thick lenses on the water surface with slow tendency to disperse, which can persist for several weeks.

d) **Emulsification**: Several oils have tendency to absorb water to form water-in-oil emulsions thereby increasing the volumes of the emulsified mass by a factor of 3 to 4. The arte at which the oil is emulsified is largely a function of sea state though viscous oils absorb water slowly. In turbulent sea conditions, low viscosity oils can incorporate as high as 80 % water by volume within 2 to 3 hours.

e) **Dissolution**: The heavy components of crude oil are virtually insoluble in sea water while lighter compounds are slightly soluble. Hence levels of dissolved PHc rarely exceed 1 mg/l following a spill. Therefore, dissolution, does not make a significant contribution to the removal of oil from the sea surface.



f) **Sedimentation**: Very few oils are sufficiently heavy to sink in sea water. However, the weathered residue gets mixed up with the suspended substances in water and may sink. This process becomes significant when water-in-oil emulsions attain specific gravity near to one and therefore need very little suspended substances to exceed the specific gravity of sea water (1.025).

g) **Oxidation:** Hydrocarbon molecules react with oxygen and either breaks down into soluble products or combine to form persistent tars. Many of these oxidation reactions are promoted by sunlight and their effect on overall dissipation is minor in relation to other weathering processes.

h) **Biodegradation** : Sea water contains a range of marine bacteria, moulds and yeasts which can use oil as source of carbon and energy. The main factors affecting the rate of biodegradation are temperature and the availability of oxygen and nutrient, principally compounds of nitrogen and phosphorous. Each type of micro-organism tends to degrade a specific group of hydrocarbons and whilst a range of bacteria exists between them which are capable of degrading most of the wide variety of compounds in crude oil, some components are resistant to attack.

Because the micro-organisms live in sea water, biodegradation can only take place at an oil/water interface. At sea, the creation of oil droplets, either through natural or chemical dispersion, increases the interfacial area available for biological activity and so enhances degradation.

The processes of spreading, evaporation, dispersion, emulsification and dissolution are most important during the early stages of a spill whilst oxidation, sedimentation and biodegradation are long-term processes, which determine the ultimate fate of oil. Fig.3.1 shows schematic diagram of weathering processes with time.

Schematic diagram of weathering processes with time

It should be appreciated that throughout the lifetime of an oil slick, it continues to drift on the sea surface, independent of these processes. The actual mechanism governing movement is complex but experience shows that oil drift can be predicted by taking into account wind-induced effects and surface water currents. These can be calculated using mathematical modeling to determine the oil spill trajectory. The wind-induced effect is normally taken as 1-3% of the wind velocity, and the current effect as 110% of the current velocity. Reliable prediction of slick movement is clearly dependent upon the availability of good wind, tide and current data.

An understanding of the way in which weathering processes interact is important in forecasting their combined effect in changing the characteristics of different oils and the lifetime of slicks at sea. In order to predict such interactions, numerical models have been developed, based on theoretical and empirical considerations.

Accidental oil spills as indicated in 'Oil Spill Scenario' in section 2.1 of this plan might occur in the area of SPM. On the basis of the data modeled, the results indicate that

a) about 38 % of hydrocarbons are lost by evaporation, 2.8 % by emulsification and 0.75 % by dissolution within 5 hours;
b) the quantum of dissolved oil increases up to initial 5 hours and thereafter decreases as lighter (more soluble) hydrocarbons evaporate;
c) after 50 hour, no oil dissolves;
d) the trend of emulsified oil is similar to that of evaporated oil but emulsification occurs at a slow rate;
e) the radius of oil slicks increases to nearly 1400 m at the end of 148 hours; and
f) the maximum PHc concentration in water is about 39 µg/l.

The spill trajectories clearly reveal the dominance of wind in deciding the location of landfall of the weathered oil. Thus during June-August, the spill will be preferentially transported in the north east direction under the influence of south west winds while during October-November, and possible up-to February, the oil will be predominantly carried to the southern shore. It is also evident that under the influence of the southwest winds, the oil will be deposited on the northern shore within 60 hours, while it might take about 80 hours to reach the southern shore during north east winds.

2.4 Development of oil spill scenarios including worst case discharge

The scenario of the spill are classified under two categories:

1. Oil Spill at Mundra Port Multi-Purpose Terminals/ Basins
2. Oil Spill at SPM

Oil Spill at Mundra Port Multi-Purpose Terminals/ Basins

a) Leak during cargo transfer operations Minor (250 liters)

This can occur at the start of cargo operations, during operation due to leakage in pipes, expansion joints, and at the time of disconnection of hose at manifold. However, such instances are remote on implementation of International Safety Management by Ships and Quality Management systems by Port.

b) Slop tank / bunker tank overflow at, Jetty / Ship Minor (250 - 1000 ltrs.)

This source of pollution is purely of an accidental nature. The ship is expected to be ship shape with good trained crew and this has been emphasized to the Master of the vessel at the time of cargo transfer / bunkering. Based on a rate of 20 cbm/hr. and reaction time of 1 min, and hose content of 150 ltrs., likely spill is only 250 litres. A ship shore check list for cargo operations and bunkering is employed. A joint declaration is made by Marine Staff and Chief Officer / Master and enforced by Marine Manager. This results in good ship / shore co-ordination.

c) Spill during berthing (tug impact) Moderate (3000 liters)

Accidental contact with tugs or another marine structure is a possibility but quantum is not going to be significant because of Fendering system employed and training given to tug crews. Also with concept of double hull tanker the entire cargo compartments are protected by another hull, thus cargo spillage due to impact of tug is remote.

d) Grounding / Hull Damage :

APSEZL operates dry cargo & liquid cargo berths. Tankers mainly carry Furnace oil, Naphtha, Methanol, High Speed Diesel, Super Kerosene Oil and Vegetable oil. Oil transfer operations at the jetty are supervised by Liquid terminal staff. Manifold area has receptacle facilities to prevent accidental spills at connection / disconnection time. Berthing is done under controlled conditions and spill due to contact damage to underwater oil tanks is very remote. Radio officer controls movement of vessels in and around the berth and traffic presently is insignificant to pose any collision damage risk. Under water sea bed characteristic is soft sand. The berth area of about 500^2 m is surveyed monthly for any changes and underwater obstructions; hence grounding resulting into oil spill is very remote.

Oil Spill at SPM

a) Hose Puncture while unloading:

In such an event, crude oil, about 10670 Kgs may spill onto water. On spillage the oil slick will be carried away at a distant location depending upon water current and wind direction. The trained crew of the maintenance vessel patrolling the area during unloading, would control the oil slick movement by using booms and subsequently, the oil will be collected by the skimmer.

b) Failure of Swivel joint of SPM:

In this event about 17780 Kgs of crude oil may spill onto water. In this case the leakage may be detected visually by the personnel monitoring the operation from the ship tanker or by the detectors provided on the SPM.

c) Leakage of Crude oil at PLEM or from the submarine pipeline:

This case will occur at least 20 m below the water surface, oil being lighter than water will travel upward and float on to water. By the time oil water reaches the sea water surface, the oil droplets may start undergoing "weathering process" and it may form emulsion along with water.

d) Ship Collision Frequency :

Based on the statistical data and its analysis carried out by National Institute of Oceanography, the probability of this type of accident is about one in every seven years for the traffic projection and hence, this case is ignored.

e) Ship Grounding Frequency :

Based on the statistical data and its analysis carried out by National Institute of Oceanography, the probability of this type of accident is about one in eleven years for the traffic projection and hence, his case is also ignored. Also with concept of double hull tanker the entire cargo compartments are protected by another hull, thus cargo spillage due to grounding is remote.

2.5 Shoreline sensitivity mapping

Gulf of Kutch is a typical semi-enclosed basin where the tidal forces interact with the open ocean waters of the sea, across its western open boundary at Okha. The currents of the region are tidal-driven and the water column is vertically well mixed. These features make the numerical modeling task easier, as a 2-D hydrodynamic model is sufficient to accurately reproduce the tides and currents for the study region in the Gulf of Kutch at Mundra.

The model domain of longitudes of 68° 50' 56.7" E and 70^0 27' 36.9'' E and the latitudes of 22°14' 58.8" N and 23° 01' 49.1'' N is selected for carrying out sensitivity analysis and predicting the fate and transport of oil spill that may take place at APSEZL's SPMs, Basins, berths and tanker route near Mundra coast in Gulf of Kutch.

The bottom roughness in the Gulf of Kutch varies due to the variation of bed sediment grain sizes. The bed consists of various sizes of clay, sand, silt and rocky soils. In the present study a uniform Manning's roughness coefficient has been used for numerical runs of hydrodynamic processes. The filled contours of Chezy's roughness coefficient are shown in Fig. A.1.4. The same roughness coefficient has been used to predict tides and tidal velocities in the Mundra area for prediction of oil spill trajectory.

The interpolated Chezy's coefficient calculated based on Manning's roughness and total water depth is shown in Fig.A1.4. The sensitivity analysis has been carried out with various Manning's value, which is the combined effect of d_{50} sediment size and bed configuration, to calibrate the model with respect to the tide data of March and October 1994, at Sikka. The computational runs were continued with various sets of various bed roughness values till computed and measured tide levels are within the acceptable limit.

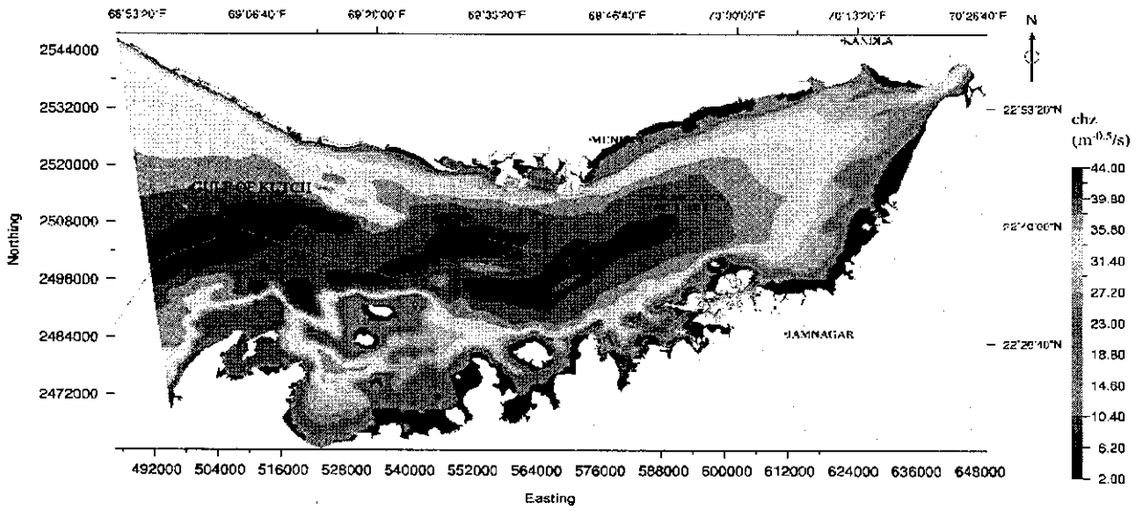


Fig.A1.4 Chezy's coefficient

For Shoreline sensitivity mapping refer Volume 2 (Annexure-V, VI and VII) of Oil Spill Risk Assessment.

2.6 Shoreline resources, priorities for protection

The SPMs and the Marine facilities (Existing Berths, South Basin, West Basin, North Basin, East Basin and LNG Berth etc.) are located in the Northern side of Gulf of Kutch at Mundra. VLCCs bring Crude oil and unload at the two SPMs which are connected to the Shore tanks by means of Submarine pipelines. The Crude unloaded at these SPMs is pumped through Submarine pipeline to Shore tank farm area.

Various Marine craft / solid cargo/ liquid cargo vessels traverse through the Gulf waters to berth at the various Terminals / Berths located in the new Mundra port limit. The general layout of the various facilities like SPMs, terminals etc. within the Mundra port limit area are shown in Fig.1.1 to Fig.1.4 in chapter 1. There is a probability of spillage at SPMs, along the sub-sea pipelines and tanker route during unloading operations and transportation. Apart from these operations at the SPMs, loading / unloading operations at the different berths of the Mundra port – South Basin, West Basin, North Basin, East Basin, LNG jetty and existing berths also may give raise to accidental spills at the berth locations. The spills at these locations may affect the shore and other facilities along the coast of Gulf of Kutch. The coast of Mundra has tidal flats, sand bars and not much in the way of mangroves. The mangroves, Marine Park / Marine Sanctuary etc. are on the Southern side of Gulf of Kutch. As it was observed that the spills occurring at the various locations of the APSEZL Marine facilities may reach the Coast on the Northern side as well as on the Southern side of the Gulf depending upon the season, there is a need to protect the environment in the event of an oil spill at any of the APSEZL Marine facilities.

Shoreline Resources available with APSEZL, Mundra for deployment during shoreline cleanup/ emergent situation:

Item	Quantity
Oil Spill Dispersants	15000 liters
Sorbent pads	2000 nos.
Portable dispersant storage tank: 1000 ltr capacity	1 no.
Portable pumps	2 nos.
Oil discharge hose, 3", 2 x 10 m	1 set
Tanker Trucks	04 nos.
Mini Vacuum Pump (30 m3 / hr)	05 nos.
Sorbent Boom Pack(12.5cm x 4 M)	500 mtr
Slurry Pump (60 m3 / hr)	01 no.
Start Tank with capacity 10000 liter(10 m^3)	02 nos.
OSD Applicator- Oil Dispersant Spry Unit(20 ltr) for use on beach and inter tidal zones	02 nos.

Marine resources in Gulf of Kutch

Phytoplankton

Phytoplanktons are vast array of minute and microscopic plants passively drifting in natural waters and mostly confined to the illuminated zone. In an ecosystem these organisms constitute primary producers forming the first link in the food chain. Phytoplankton long has been used as indicators of water quality. Some species flourish in highly eutrophic waters while others are very sensitive to organic and/or chemical wastes. Some species develop noxious blooms, sometimes creating offensive tastes and odours or anoxic or toxic conditions resulting in animal death or human illness. Because of their short life cycles, plankton responds quickly to environmental changes. Hence their standing crop in terms of biomass, cell counts and species composition are more likely to indicate the quality of the water mass in which they are found. Generally, phytoplankton standing crop is studied in terms of biomass by estimating chlorophyll and primary productivity, while in terms of population by counting total number of cells and their generic composition. When under stress or at the end of their life cycle, chlorophyll in phytoplankton decomposes to phaeophytin as one of the major products.

Phytopigments

During April 2010, the phytoplankton pigments viz. chlorophyll a (1.7 – 2.4 mg/m3; av 1.9 mg/m3) and phaeophytin (0.3 – 1.2 mg/m3; av 0.7 mg/m3) varied considerably. In October 2010, chlorophyll a ranged from 2.0 – 4.2 mg/m3 (av 3.1 mg/m3) and phaeophytin from 0.7 - 1.1 mg/m3 (av 0.7 mg/m3) (Tables 8.1 and 8.2). The average concentration (mg/m3) of chlorophyll a off Vadinar during different sampling events (2010) is listed in Table 8.1:

Table 8.1: Average chlorophyll a (mg/m3) off Vadinar (April 2010 to October 2010)

Area	Pathfinder	Nearshore	ESSAR DP	IOC SPM	ESSAR SPM	Salaya Creek	Gulf
April 2010	2.4	2.1	1.9	1.4	2.0	2.0	1.7
Oct 2010	2.1	4.2	2.8	4.1	2.0	-	3.7

The values of phaeophytin during the present monitoring period are given in Tables 8.2, while, the average concentrations (mg/m3) between different sampling events (April 2010 and October 2010) are listed in Table 8.2.

Table 8.2: Average phaeophytin (mg/m^3) off Vadinar (April 2010 to October 2010)

Month	Pathfinder	Nearshore	ESSAR DP	IOC SPM	Essar SPM	Salaya Creek	Gulf
April 2010	1.2	0.6	0.8	0.3	0.6	0.8	0.6
Oct 2010	1.1	0.9	1.1	0.9	0.7	-	0.8

Phytoplankton population

As is generally the case with Coastal waters, the phytoplankton population density (68-332 nox10^3/l; av 186 no x 10^3/l) and generic diversity (11-30 no; av 18 no) varied over a wide range and in a random manner during April 2010 (Table 8.3). In October 2010 the phytoplankton population density ranged from 100-789.6 nox10^3/l (av 329.4 no x 10^3/l) and generic diversity ranged from 12-25 no (av 19 no) (Table 8.4) off Vadinar.

Table 8.3: Average phytoplankton population density (no x 10^3/l) and total genera (no) off Vadinar (April 2010 to October 2010)

Month	Pathfinder		Nearshore		ESSAR DP		IOC SPM	
	Cell count (nox10^3/l)	Total genera (no.)	Cell count (nox10^3/l)	Total genera (no.)	Cell count (nox10^3/l)	Total genera (no.)	Cell count (nox10^3/l)	Total genera (no.)
Apr-10	216.2	19	200.5	17	192.7	15	127.7	18
Oct 2010	203.1	19	446.6	20	323.6	23	360.4	18

Month	Essar SPM		Salaya Creek		Gulf	
	Cell count (nox10^3/l)	Total genera (no.)	Cell count (nox10^3/l)	Total genera (no.)	Cell count (nox10^3/l)	Total genera (no.)
Apr-10	124	16	198.5	18	211	15
Oct 2010	260	16	-	-	487.6	14

The above results indicated wide temporal and spatial fluctuations in the standing stock of phytoplankton between April 2010 and October 2010 off Vadinar. In general, the coastal waters revealed high average cell counts during October 2010 as compared to previous data. The generic diversity of phytoplankton during April 2010 widely varied with the dominance of genera such as Nitzschia (17.7%), Guinardia (16.7%), Skeletonema (9.1%), Thalassiosira (7.4%), Hemiaulus (7.2%), Navicula (6.1%), Rhizosolenia (4.5%), Biddulphia (3.4%) and Leptocylindrus (3.4%). In October 2010, the dominant phytoplankton genera were Leptocylindrus (57.6%), Guinardia (13.9%), Nitzschia (8.1%) and Chaetoceros (7.2%)

Mangroves

According to one estimate the dense mangrove cover of Narara Bet is spread over an area of 5.5 km^2. The mangrove area has increased in recent years due to extensive plantations made by the Forest Department. Mangrove cover and mudflat areas (km^2) in Jamnagar, Lalpur, Khambalia and Kalyanpur Talukas estimated based on satellite data are given in Table 8.4 below:

Table 8.4: Mangrove areas (km^2) along Jamnagar coast

Taluka	Mangroves (Dense)	Mangroves (Sparse)	Tidal mudflats
Jamnagar	12.03	23.91	83.53
Lalpur	1.96	3.95	50.50
Khambalia	3.86	11.48	101.94
Kalyanpur	0.04	0.01	0.78

*Singh H.S., 2000. Mangrove in Gujarat, GEER foundation

Mangroves at Vadinar

The intertidal expanse in the vicinity of Dargah ranged in 1 – 1.2 km. Lower intertidal zone was muddy with dense algal growth. The mid and upper intertidal zone sustained mangrove vegetation of ~ 500 m width. The zone around HTL was dominated by a sandy beach with ~ 5 m width and a narrow beam at the backshore. The distribution of mangroves at Vadinar during the present monitoring (April 2010) is given in Table 8.5 below:

Table 8.5: Distribution of mangroves at Vadinar (Dargah - North side)

	Location	Species	% FQ	Density	Height (m)	DBH (cm)	Seedling (no/m^2)
D1	22° 26'42.6''N 69° 42' 07.8''E	*A. marina*	100	Sep-67 -38	0.5 - 3.5	<2.6 - 6	0 - 2
D2	22° 26' 50.5''N 69° 41' 52.9''E	*A. marina*	40	0 - 5 -2	0.5 - 1.5	<2.5 - 4	0 - 1
Vadinar (Dargah - south side; afforested area)							
D3	22° 26' 30.8''N 69° 42' 05.6''E	*A. marina*	100	(20 - 75) -50	1.0 - 2.3	<1.5 - 5	0 - 15

As evident from above data, the stand density of *A.marina* at two locations (D1 and D2) along North-east of Vadinar Dargah varied from nil to 67 plants/100 m^2 with higher density of plants noticed at location D1. Frequency of occurrence ranged from 40 - 100% in the mid and upper intertidal zones. The height varied from 0.5 to 3.5 m. Mostly the plants were dwarf (av 1 m) with occasional tall plants of 3.5 m. Diameter at Breadth Height (DBH) varied from <2.5 to 6 cm. The seedling density was poor and varied from 0 - 2 no/m^2. The mid intertidal segment was the popular feeding site for flocks of flamingos.

The upper intertidal expanse along South-west of Vadinar Dargah (D3) showed good growth of afforested mangroves (Table 8.5). The density of mangroves ranged from 20 - 75 plants/100 m^2 with an average of 50 plants/100 m^2. The plant height varied from 1.0 to 2.3 m and the DBH ranged from <1.5 to 5 cm. The seedling density was low (0-15 no/m^2), however, better than that noticed along North-east of Vadinar - Dargah (D1 & D2). Present results are comparable with earlier monitoring studies (2007 - 2009).

Mangroves at Narara

The intertidal expanse along the IOCL pipeline corridor varied from 2000 - 2200 m. The mangroves vegetation from upper intertidal region was observed to be healthy, dominated by *A.marina* on both sides of the pipeline corridor. Four locations (N1 to N4) were selected for monitoring of mangroves at Narara as detailed in below given Table 7.6.

Table 8.6: Distribution of mangroves at Narara

	Location	Species	% FQ	Density	Height (m)	DBH (cm)	Seedling (no/m^2)
N1	22° 27' 56.8''N 69° 43' 43.2''E	*A.marina*	100	20-45 (38)	2-3	3-8	0-85
		C.tagal	10	0.7*	-	-	-
		R.mucronata	5	0.2*	-	-	-
N2	22° 27' 59.1''N 69° 43' 21.3''E	*A.marina*	100	60-90 (85)	2-4	25-12	0-7
N3	22° 28' 03.5''N 69° 43' 27.4''E	*A.marina* *R mucronata*	100 3	28-85 (50)	0.5-2.5 -	<15-7 -	0-55 -
N4	22° 28' 07.2''N 69° 43' 24.6''E	*A.marina*	100	30-130 (80)	0.5-3.5	<2.0- 3.5	0-10

* no/500 m^2

As can be noticed in the above table, the plant density of *A.marina* varied from 20 - 130 plants/100 m^2 with a frequency of occurrence of 100% at Narara. The species like *Ceriops tagal* (7 plants/500 m^2) and *Rhizophora mucronata* (2 plants/500 m^2 - 3 plants/100 m^2) were rarely noticed. The locations N2 (85 plants/100 m^2) and N4 (80 plants/100 m^2) revealed better average density of *A.marina* as compared to the rest. The height of *A.marina* varied from 0.5 to 4 m with N2 and N4 locations indicating better plant height than the rest. The DBH varied from <1.5 to 12 cm at the monitoring locations. The seedling density ranged from 0 - 85 no/m^2 with N1 and N3 locations sustained better seedling density than the rest. Few new plants (30 - 45 cm in height) of *C.tagal* and *R.mucronata* were noticed at the EOL pipeline corridor during the present monitoring.

Sand dune vegetation

The narrow beach of ~ 5 m width around HTL along Narara Bet is marked with berm of ~ 1.5-2 m width, followed by back shore sandy zone. Occasional shrubs of *Salicornia brachiata* and *Suaeda maritima* are observed on the backshore sandy zone. The sand dune flora is more predominant on berm and immediate back shore zone of ~5 m width. Sand dune flora is represented by seven species viz; *Crassa sp, Cyperus arenarius, Launea sp, Suaeda maritima, Salicornia brachiata,* unidentified *Poaceae* member and unidentified *Fabaceae* member.

Seaweeds and Seagrasses

Seaweeds, which are known as a source of food, fodder and manure, are mostly found attached to various substrata like sandy, muddy and coralline sediments as well as rocky areas and play a significant role in enriching the sea by adding dissolved organic matter, nutrients and detritus besides serving as nursery areas for the larvae and juveniles of innumerable marine organisms. Some green Seaweeds are edible, red algae are the important source of agar and some of the brown algae are used for manufacturing algin and alginic acid. Seaweeds are also used to produce some bioactive compounds.

The algal zone of Narara Bet is confined to 1.2-2.5 km width. A total of 62 species of algae and 3 species of sea grasses are recorded from this region. Among them *Lyngbya, Caulerpa, Cladophora, Ulva, Cystoceira, Dictyota, Hydroclathrus, Padina, Sargassum, Acanthopora, Amphiroa, Champia, Centraceros, Gracilaria, Hypnea* and *Polysiphonia* were common with the dominance of *Padina* and *Gracilaria* at the lower reef flat. The open mudflats of Narara Bet are dominated by algae like *Enteromorpha, Ulva, Lyngbya* and *Polysiphonia*, while, the upper sandy shore and mangrove areas are associated with *Enteromorpha* and *Ulva*. Seagrasses such as *Halophila ovata* and *Halodule uninervis* are common in patches on sandy regions of the reef, while, *Halophila beccarii* occasionally occurred on mudflats along the tidal channels.

Open mudflats near Dargah and Narara pipeline corridor supported growth of twelve marine algae dominated by Enteromorpha spp (Table 8.7). The biomass of Enteromorpha estimated at ~ 4 kg/m2.

Table 8.7: Marine algal flora along Narara/Vadinar

Sr. No.	Species	% FO*	ES*
1	*Enteromorpha clathrata*	100	D
2	*Enteromorpha intestinalis*	100	D
3	*Caulerpa racemosa*	50	C
4	*Ulva fasciata*	100	D
5	*Ulva lactuta*	100	D
6	*Ulva reticulate*	90	D
7	*Codium elongatum*	30	O
8	*Sargassum ilicifolium*	45	C
9	*Sargassum tenerimmum*	60	CD
10	*Gracilaria corticata*	55	C
11	*Gracillaria verrucosa*	85	C
12	*Polysiphonia platycarpa*	20	O

*%FO: Percentage Frequency Occurrence, ES: Ecological Status, D: Dominant (% FO = 80-100), CD: Co-dominant (% FO = 60-79), C: Common (% FO = 40-59), O: Occasional (% FO = 20-39).

The intertidal zone of Kalubhar Tapu harbours 47 species of marine algae and three species of seagrasses. The reef areas of this island are dominated by *Dictyota*, *Gracilaria*, *Padina*, *Hydroclathrus*, *Ulva* and *Hypnea*. The open mudflats and sandy areas at the upper intertidal are preferred by *Enteromorpha*, *Ulva*, *Lyngbya* and *Polysiphonia*. The sandy region of the reef flat supported seagrasses like *Halophila* and *Halodule*.

Zooplankton

The zooplankton standing stock in terms of biomass and population density during April 2010 (Table 8.8) varied from 0.2 to 121.2 ml/100m^3 (av 3.3 ml/100m^3) and 2.2-722.7 x 10^3/100m^3 (av 39 x 10^3/100m^3), respectively while during October 2010 the zooplankton biomass and abundance ranged from 0.2 to 12.0 ml/100m^3 (av 3.5 ml/100m^3) and 2.5-157.8 x 10^3/100m^3 (av 48.4 x 10^3/100m^3) respectively suggesting normal secondary production off Vadinar during the monitoring period.

The average zooplankton biomass (ml/100m^3), population density (nox10^3/100m^3) and total groups (no) off Vadinar during the monitoring period varied in accordance with the data presented in Table 8.8.

Table 8.8: Average values of zooplankton (A) biomass (ml/100m^3) (B) Population density (nox10^3/100m^3) and (c) total groups (no) off Vadinar (April 2010 – October 2010)

Area		Pathfinder	Nearshore	ESSAR DP	IOC SPM	Essar SPM	Salaya Creek	Gulf
April 2010	A	8.3	1.1	1.1	0.9	1.4	2.5	3.5
	B	89.9	24.6	14.4	22.7	12.7	20.4	37.4
	C	17	15	12	16	13	16	17
Oct 2010	A	4	3.9	1.5	3	5.7	-	2.1
	B	57.4	55.9	23.5	30.5	83.1	-	32.8
	C	13	11	10	10	9	-	7

The overall zooplankton standing stock was low and highly variable off Vadinar which could be due to high patchiness and seasonal variability in their distribution apart from high grazing pressure at higher trophic levels.

During April 2010, 24 faunal groups were identified in the coastal waters off Vadinar during the monitoring period while 17 faunal groups were present in the samples of October 2010. The most common faunal groups were copepods (40.5%), decapod larvae (19%), gastropods (22.5%), lamellibranchs (10.7%), and foraminiferans (2.1%) in April 2010. In addition to the above, groups like chaetognaths, siphonophores, *Lucifer* sp, polychaetes, ctenophores, medusae, amphipods, ostracods, mysids, heteropods, isopods, stomatopod larvae, appendicularians and fish larvae were also frequently noticed but in less numbers during April 2010. During October 2010, the dominant groups were copepods (93.6%) and decapod larvae (4.8%). In general, the coastal waters off Vadinar revealed a moderate production of zooplankton associated with random fluctuations and seasonal changes.

Macro benthos

The organisms inhabiting the sediment are referred as benthos. Depending upon their size, benthic animals are divided into three categories, macrofauna, microfauna and meiofauna and macrofauna. Benthic community responses to environmental perturbations are useful in assessing the impact of anthropogenic perturbations on environmental quality. Macrobenthic organisms which are considered for the present study are animals with body size larger than 0.5 mm. The presence of benthic species in a given assemblage and its population density depend on numerous factors, both biotic and abiotic.

Intertidal macrofauna

During April 2010, Intertidal macrofauna was studied along 5 transects viz. 1 transect (Transect I) at Kalubhar Island and 4 transects at Narara Bet. Several locations were sampled along each transect between the HTL and the LTL viz; High Water (HW), Mid Water (MW) and Low Water (LW). The intertidal macrofaunal standing stock in terms of population density (50-7800 no/m^2, av 2292 no/m^2) and biomass (0.1-37.2 g/m^2; wet wt, av. 9.2 g/m^2; wet wt) varied widely During the post monsoon, only the first three transects were sampled. In October 2010, the intertidal macrofaunal standing stock in terms of population density ranged from 0-3625 no/m^2 (av 1185 no/m^2) and biomass from 0-67.8 g/m^2; wet wt (av. 14.6 g/m^2; wet wt). These results are compared with historical data in Table 8.9.

Table 8.9 Average of intertidal macro benthos off Vadinar during April 2010 to October 2010, (A) Biomass (g/m^2) (B) Population density (no/m^2) and (C) Total groups

Transect		I	II	III	IV	V
April 2010	A	11.2	4.2	13.7	10.7	6.1
	B	3983	1172	1292	2401	2614
	C	5	3	6	6	3
Oct 2010	A	11.9	16.8	15.1	-	-
	B	1495	904	1156	-	-
	C	5	7	5	-	-

Overall, the intertidal region sustained good faunal standing stock and diversity and the contribution of major faunal components are comparable over the past many years at Narara Bet/Kalubhar.

Subtidal macrofauna

Subtidal macrofauna was studied at 13 stations in the coastal system off Vadinar during April 2010 and at 10 stations during October 2010. The distribution of subtidal faunal standing stock in terms of biomass (0.3 - 41.0 g/m^2; av 8.0 g/m^2 wet wt) and population density (150-8925 no/m^2; av 1902 no/m^2) during April 2010. In October 2010 the biomass ranged from 0.3 – 23.9 g/m^2 (av 7.1 g/m^2; wet wt) and population density ranged from 125-14975 no/m^2 (av 2282 no/m^2) The current data is listed (April 2010 – Oct 2010) in Table 8.10.

Table 8.10 Average of subtidal macrobenthos off Vadinar during April 2010 to October 2010, (A) Biomass (g/m^2) (B) Population density (no/m^2) and (C) Total groups

Area		Pathfinder	Nearshore	ESSAR DP	IOC SPM	ESSAR SPM	Salaya Creek	Gulf
April 2010	A	11.2	2.9	2.0	6.1	1.3	15.5	6.4
	B	3833	338	388	694	2375	1553	1865.5
	C	7	3	4	6	5	6	4
Oct 2010	A	12.1	7.7	1.9	4.9	1.8	-	10.6
	B	5019	2967	400	1169	181	-	1652
	C	8	5	4	4	2	-	7

The macrobenthic population was dominated by polychaetes (50.1%), amphipods (18.5%), pelecypods (8.2%), decapod larvae (7.4%), tanaids (3.6%) and foraminiferans (3.2%) during April and by polychaetes (76.3%), amphipods (12.3%) and pelecypods (5%) during October 2010.

Corals and associated biota

Live corals at the Narara and Kalubhar reefs are mainly confined to the lower littoral (reef flat) and shallow subtidal zones (< 8 m). They are absent at the upper reef flat probably because of high rate of sedimentation and long exposure during low tide.

Narara Bet

The eastern segment of Narara Bet represents a formation of vast mud flat, which resulted in significant negative influence on the live coral population. Many regions along the reef flat on the western side are exposed during low tide for prolonged periods because of which the distribution of live corals was poor. In all 30 and 22 Scleractinian species have been identified in the intertidal and subtidal zones respectively of Narara Bet with *Montipora, Goniopora, Porites, Favia, Favites, Goniastrea, Platygyra, Cyphastrea, Pseudosiderastrea, Turbinaria, Leptastrea* and *Symphyllia* as the dominant genera.

In general, the live coral density decreased with depth. The live corals were absent beyond 8 m (CD). However, the subtidal area at Narara sustained good coral populations within 5 m (CD). Distance-wise corals were rich within 250 m towards the sea from the LTL. The corals of the genera *Montipora, Porites, Favites, Goniastrea, Goniopora, Cyphastrea, Leptastrea, Favia* and *Turbinaria* dominated the subtidal area.

Kalubhar

In general, Kalubhar reef sustained relatively healthy live corals at the lower intertidal and subtidal (<7 m depth) zones as compared to the population at the Narara reef. The north and north-west regions of Kalubhar had better coral density and diversity as compared to the east and south-east regions because of high sedimentation of the reef flat and the subtidal zones. Overall, 30 and 7 species of Scleractinians in the intertidal and subtidal zones respectively at Kalubhar have been identified. The corals at Kalubhar were mainly represented by genera *Montipora, Favia, Favites, Porites, Goniastrea, Goniopora, Cyphastrea, Platygyra,* and *Symphyllia* and *Turbinaria.* The live corals were absent at the reef edge of 50 m width due to total exposure for longer period whereas their coverage increased (90 to 100%) at the reef slope below 1 m depth.

A rich reef associated flora and fauna was noticed at Kalubhar. The common and dominant seaweed genera were *Sargassum*, *Gelidiella*, *Acanthophora*, *Ulva*, *Caulerpa*, *Codium*, *Dictyota*, *Padina*, *Halymenia*, *Enteromorpha*, and *Gracillaria*. Varieties of sponges were associated with coral boulders. The fauna consisted of coelenterates (*Zoanthus* sp., *Discosoma* sp., *Stoichactis*, *giganteum*, *Cerianthus* sp. and variety of corals), annelids (various polychaetes), echiuroid (*Ikedella misakiensis*), crustaceans (amphipods, isopods, *Acetes* sp., shrimps and crabs), molluscs (*Octopus* sp., *Sepia* sp., *Loligo* sp., gastropods, bivalves, nudibranchs etc.) echinoderms and variety of reef fishes.

Fishery

Gujarat ranks number one position in marine fish production in India. The Gulf contributes about 22% to the fish production of the state. The share of the Jamnagar District is between 5 and 14% (av 10%) to the State's total marine fish landings. The important fish landing centres in the vicinity of IOCL SPM area which falls under Khambalia zone are Vadinar, Bharana, Nana Amla and Salaya which together contributed about 6823 t, 8253 t and 5330 t of fish landings in 2006-07, 2007-08 and 2008-09 respectively to the total landings of the Jamnagar District. Similarly, the important fish landing centres in the vicinity of Sikka which falls under Jamnagar zone are Sachana, Baid, Sarmat, Bedi and Sikka which together contributed about 4768 t, 5122 t and 5848 t of fish landings in 2006-07, 2007-08 and 2008-09 respectively. Within the Jamnagar zone, the major landings (98%) were from Sachana (32%), Baid (27%), Sikka (19.7%) and Bedi (18.9%) during the last 3 years. Within the Khambalia zone, the major landings (81-89%) were at Salaya during the period 2006-09. On an average the Khambalia zone (56.5%) contributed to about 13% higher fish landings than Jamnagar zone (43.5%) for the last 3 years. However, the landings at Sikka (1.3%) and Vadinar (0.5%) to the total landings of the district were negligible during the period 2006-2009.

Reptiles and mammals

The reptiles are mainly represented by marine turtles Chelonia mydas and Lepidochelys olivacea which breed and spawn on the sandy beach along the Sikka-Vadinar coast as well as on the islands.

Dolphin (*Dolphinus delphis*) and whale (*Balanoptera* sp) are common in the Gulf. Though occurrence of Dugong (*Dugong dugon*) in the Gulf particularly along the Jamnagar coast has been reported, there are no recent sightings.

The resources discussed above likely to be threatened are tidal flats, Phytoplankton, Phytopigments, Mangroves, seaweeds and seagrasses, Zooplankton, Macrobenthos, Corals and associated biota, salt works fishing activities and other vocational related to marine sensitive areas in the coast of Vadinar and Sikka.

It has been observed from the modeling study that during pre-monsoon season, the spills occurring at the APSEZL marine facilities move towards the southern / southwestern part of the Gulf of Kutch nearer to the facilities depending on tide phase.

The spills taking place at the APSEZL marine facilities move towards northern coast of Gulf of Kutch during monsoon season and affect the coast near Mundra, Kandla etc.

During post - monsoon season, the spills taking place at the APSEZL marine facilities move towards south / southwest and affect the islands /coast on southern side of the Gulf of Kutch.

2.7 Special local considerations

Considering the distant proximity of various other installations with the port of Mundra, in case of a tier 1 spill, no other special considerations are deemed to be required apart from an active spill response close to the port facility itself.

3 Response strategy

3.1 Philosophy and objectives

This plan is intended to assist APSEZL in dealing with an accidental release or discharge of oil. Its primary purpose is to set in motion the necessary actions to stop or minimize the discharge and to mitigate its effects. Effective planning ensures that the necessary actions are taken in a structured, logical and timely manner.

This plan guides the HOD– Marine and his Duty Staff through the decisions which will be required in an incident response. The tables, figures and checklists provide a visible form of information, thus reducing the chance of oversight or error during the early stages of dealing with an emergency situation.

For this plan to be effective, it must be:

- familiar to those APSEZL staff with key response functions;
- regularly exercised; and,
- Reviewed and updated on a regular basis.

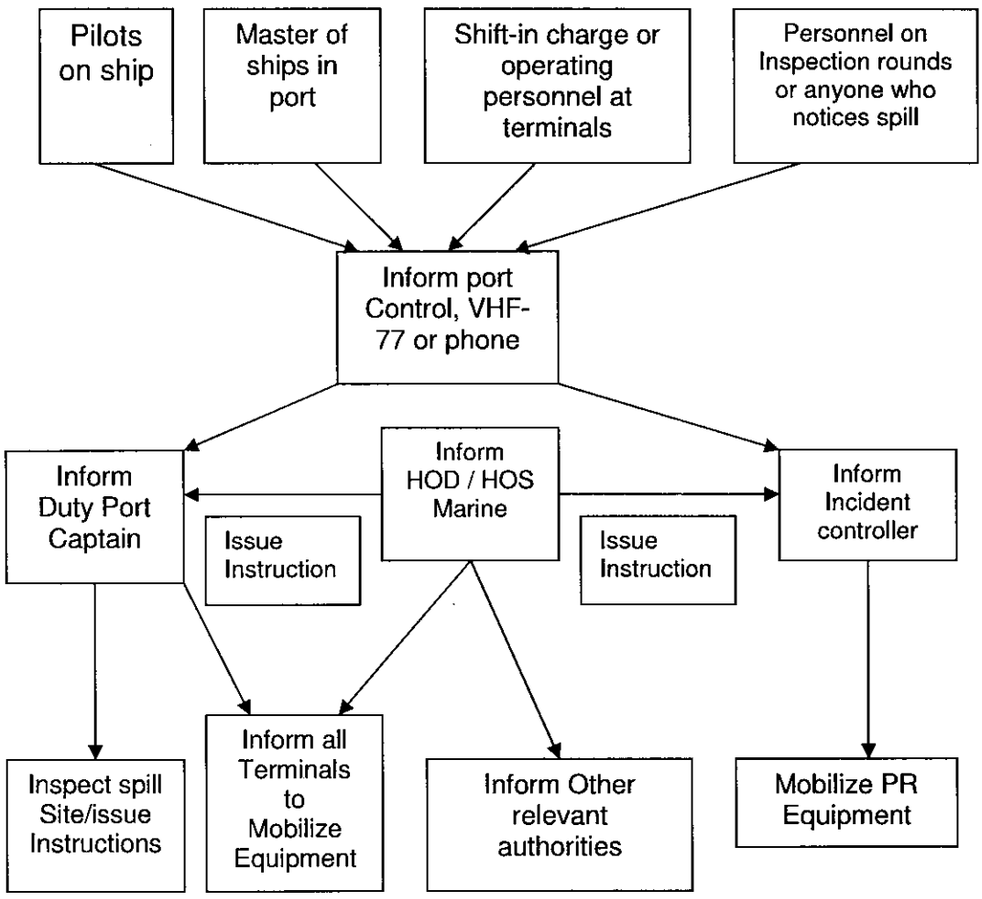
This plan uses a tiered response to oil and chemical pollution incidents. The plan is designed to deal with Tier One spillage. The products handled are likely to pose a greater fire and safety, rather than an environmental risk; there may thus be additional factors involving the safety of personnel, which will take precedence over the pollution response. In this case, reference must be made to the APSEZL Emergency Procedures Manual. The salvage and casualty management of any vessel that poses a threat of pollution is priority considerations.

During oil spill response activities, account must be taken of the following:

- site hazard information
- adherence to permit procedures
- spill site pre-entry briefing
- boat safety
- APSEZL safety manual and material safety data sheets
- Personal protective equipment needs
- heat stress
- decontamination

3.2 Limiting and adverse conditions

APSEZL is situated in natural protected Gulf of Kutch and there are less incidences of heavy wind or any other factor affecting operation.



3.3 Oil spill response in offshore zones

SPM handles (unloading) crude oil and pumps it to shore tank farm area through sub-sea pipeline. The impact of such spills on marine environment is on the higher side. Hence, oil spill equipments are required for combating oil in case of such spills at the marine facilities at Mundra.

Based on the oil spill modeling study, it has been observed that crude oil spill of 700 tons (Tier-I) will spread over an area having radius of around 400 m within 4hr. APSEZL has already having facilities for combating a Tier-1 spill.

3.4 Oil spill response in coastal zones

Contingency Chart to deal with Oil Spill

On-site Crisis Management Group – Action Group

In an emergency, the personnel available at or near the incident site play vital role. This concept is made use of in nominating the Key Persons. It is necessary to nominate a functionary as the Incident Controller who is invariably a shift-in-charge of the facility. The Incident Controller tackling the emergency in real times requires the support from various other services i.e. Fire & Safety, Medical Services covering communication, transport and personal functions etc. A key person for each of these services therefore, is nominated.

Overall in charge of these activities is **Chief Operating Officer – Mundra Port.** The different functional coordinators, designated, will co-ordinate with Chief Controller in their respective functional areas. It is suggested that key personal chart be developed, giving the names, designation, telephone nos. of top level personnel who will act as coordinators in different disciplines/services. The duties and the responsibilities of various Key Persons and Coordinators need to be written down on a chart and should be made available across the organization at the site / location.

Roles & Responsibilities

Incident Control Officer – (HOS – Marine / Duty Port Captain)

- Directs and co-ordinates all field operations at the scene of the accident
- Assess incident/crisis at site, nature, location, severity, casualties, resource requirement
- Classifies incident - Advises Exe. Controller, Civil Defence, Dy. Conservator, Traffic Manager - regarding crisis severity status and emergency level, wind direction, temperature, casualties and resource requirements.
- **Conducts initial briefing to Chairman**
- Activates elements of the terminal emergency plan/ site response actions
- Protect port personnel and the public
- Directs security/fire fighting/oil spillage/gas leakage/vessel accidents/natural calamities, cargo operations shutdown
- Search for casualties and arrange first aid and hospitalization
- Brief or designate a person to brief, personnel at the incident scene
- Determine information needs and inform Crisis Management Group
- Coordinates all functional heads in field operations group to take action
- Manages incident operations to mitigate for re-entry and recovery
- Coordinate search and rescue operations
- Arrange evacuation of non-essential workers to assembly points –outside port
- Arranges tugs, mooring boats and pilot(s) for sailing vessel(s)
- Co-ordinates actions, requests for additional resources and periodic tactical and logistical briefings with Site Emergency Coordinator
- Coordinate incident termination and cleanup activities
- Instructs various emergency squads as necessary

Site Emergency Coordinator – (Senior Pilot and Duty Radio Officer)

- Direct operations from the emergency control center with assistance from Crisis Management Group
- Take over central responsibility from the Site incident controller (SIC)
- Decide level of crisis and whether to activate off site emergency plan
- Instruct SIC to sound appropriate alarm
- Direct the shutting down, evacuation and other operations at the port
- Monitor on site and off site personal protection, safety and accountability

- Monitor that causalities if any are given medical aid and relatives informed
- Exercise direct operational control of the works outside the affected works
- Monitor control of traffic movements within the port
- Coordinate with the senior operating staff of the fire, police and statutory authorities
- Issue authorized statements to the news media
- Review and assess possible developments to determine the most probable course of events
- Authorize the termination of the emergency situation by sounding the all clear siren-continuous long single tone siren for one minute
- Control rehabilitation of affected areas after emergency
- Arrange for a log of the emergency

Fire Coordinator – (HOS - Fire / HOS -Safety)
(Under the direction of the Incident Control Officer)

- Announces fire incident point over the public address system and evacuates workers to the assembly points
- Informs fire station immediately and leads fire fighting team to the incident location
- Informs SIC if external fire tender / fire-fighting equipment / materials/mutual aid is required
- If necessary, arranges and activates other fire-fighting equipment
- Arranges safety equipment e.g. fire suits, protective gloves and goggles, breathing apparatus
- In liaison with Civil Engineering Department, ensures that adequate water pressure is maintained in the fire hydrant system/at the area supply
- Maintains adequate records

HOS - Security / Duty Security Officer

- Directs, gate security and facilitates evacuation, transport, first aid, rescue
- Controls the entry of unauthorized persons and vehicles-disperses crowd
- Permits the entry of authorized personnel and outside agencies for rescues operations without delay. Liaises with State police
- Allows the entry of emergency vehicles such as ambulances without hindrances
- Ensures that residents within port area are notified about disaster and instructs to evacuate if necessary
- Ensure that all people are aware of the assembly points, where the transportation vehicles are available
- Ensure that the people are as per the head count available with the assembly point section of that area
- Liaise with the Chief Medical Officer to ensure first aid is available at the assembly points
- Carry out a reconnaissance of the evacuated area before declaring the same as evacuated and report to SIC.

Medical Superintendent

- Direct medical team
- Set up casualty collection centre arrange first aid posts
- Arrange for adequate medicine, antidotes, oxygen, stretchers etc
- Contact and cooperate with local hospitals and ensure that the most likely injuries can be adequately treated at these facilities e.g. burns
- Advise Chief Emergency Controller on industrial hygiene and make sure that the facility personnel are not exposed to unacceptable levels of toxic compounds

- Make arrangements for transporting and treating the injured
- Inform the hospitals of the situation in case of a toxic release and appraise them of the antidotes necessary for the treatment
- Maintain a list of blood groups of each employee with special reference to rare blood groups
- Liaise with Govt. Hospitals/Red Cross

Marine Pollution Coordinator – Manager (Marine / pollution control)

- Minimizes the impact of an accident on the environment for which it would develop methodologies to control hazardous spills
- Monitors cooperation with emergency response squads to conduct the actual cleanup work during and after the emergency.

- In case of fire and specially if the fire involves toxic/flammable materials, to ensure responsible actions for containing the run off fire water and other water from the damaged units
- Determines the level of contamination of the site as a result of the accident
- During cyclones/floods arranges sand bags and transfers important plans and documents to higher levels

Traffic Coordinator – Duty Port Captain

- Directs operation staff
- Prepares vessels to vacate from berth
- Arranges to protect cargo in vicinity from damage
- Arranges to segregate and shift cargo in sheds
- Submits consolidated list of dangerous goods in port including tankers in port and tank farms in port area
- Coordinates with ship owners / agents/C & F agents/stevedores

Communications Officer – (Duty Port Captain / Marine Control In-charge)

- Ensure telephone operator/signal room advises entire emergency team
- On receipt of instructions from the chief Incident controller, notifies the fire brigade/police/hospitals/district collector/mutual aid partners
- Keep the switchboard open for emergency calls and transmit the same to the concerned personnel effectively
- Refrain from exchanging any information with authorized persons unless authorized to do so by the Chief Incident Controller
- Maintains contact with other vessels through VTMS

Chief Emergency Controller – (Head - HSE)

- Inform district emergency authorities-District Collector, Medical officer-Coast Guard Pollution control -Inspector of factories-Inspector of Dock Safety & Health,
- Activate the off site plan if necessary
- Liaise with Jt. Secy./Director MOST (Ministry of Shipping) or relevant Govt. authority
- Inform the media

Civil Coordinator – (HOS – Environment cell / HOS - Estate)

- Inform Gujarat Pollution Control Board and other environmental agencies about the incident for getting necessary guidance
- Instruct the contractors to carry out urgent civil works if required
- Hire the barges for collecting the spilled oil, if required

Marine Engineering Coordinator – (HOS – SPM / Diving Team in-charge)

- Organise the tugs for combating the pollution
- Start the rigging of pollution combating equipment on tugs/launches
- Hire additional crafts if required

HOD- Corporate affairs:

- Collect detailed information periodically and liaise with press about the incident
- Arrange transport facilities, if required
- Inform local authorities/District Collector about the incident (as per EAP)

HOS - Legal & HOD - Estate:

- Issue notice under Major Port Trusts Act, Indian Ports Act(Prevention & Control of Pollution) Rules, etc; to the defaulting master/owner/agent
- Arrange for settlement of claims related to the pollution(as per EAP)

3.5 Shoreline oil spill response

Most oil spills reach the shorelines and cause visible oil pollution which is particularly sensitive to public opinion. The selection and correct application of clean up techniques are therefore essential. When an oil spill occurs on open water the optimal solution is to intercept and recover the oil before it reaches the shoreline. This is because:-

- The environmental damage is normally less critical in the open water environment
- The logistics of oil removal becomes more complex in the varied natural environment of coastlines compared with the open sea.
- The costs of oil recovery increases dramatically when oil reaches sensitive shorelines compared with open water operations.

Experience has shown that it is very difficult to avoid some oil reaching the shorelines. Mechanical equipment and chemical treatment at sea are often insufficient to recover all oil spilled at sea. When the oil reaches the shoreline, a number of different parameters specific for this particular situation have to be taken into consideration:-

- Quantity of oil
- Characteristics of the oil (for instance, toxicity and viscosity)
- Prevailing on-site conditions (weather, season, tides, temperature)
- Shoreline type or combination of types (cliffs, pebble, sand, marsh)
- Special Considerations

The four main steps in a shoreline clean-up operation are:

Step 1: Assessment

- Determine the need to clean, setting priorities in line with this contingency plan
- Determine required degree of clean-up for each area in accordance with priorities
- Attain agreement between clean-up team, ecological experts, government authorities

Step 2: Select Clean-up Method

- Choose method appropriate to type of shoreline, access, degree of oiling
- Minimize damage caused by choice of clean-up technique, degree of clean-up
- Address conflicts of interest (e.g. needs of amenity use versus environment or response speed versus aggressiveness)

Step 3: Clean-up Operations

- Monitor clean-up, confirm choices made above, re-evaluate if necessary
- Minimize disturbance of shoreline features
- Minimize collection of un-oiled debris, sediments

Step 4: Termination / Monitoring

- Ongoing assessment of clean-up operations
- Determine when clean-up objectives have been met
- Post-spill monitoring to confirm recovery of shoreline features, biota

The four main methods for shoreline clean-up are as follows:-

A. Pumping and Skimming Techniques

- Applicable to shorelines that are heavily oiled.
- Often the first step in cleaning a heavily contaminated shoreline.
- Preferred option because it results in fluid wastes that are relatively free of sediments and debris, which are more easily dealt with in disposal.
- Pumping and skimming techniques can also be used in conjunction with flushing techniques.

B. Flushing Techniques

- Use water or steam to flush oil from the beach, and direct it to a recovery location.
- Applicable to heavily contaminated beaches, and substrates that are relatively impermeable (e.g., mud and saturated beaches, boulders, and man-made structures) that will not allow the flushed oil to penetrate the beach surface.
- Typically carried out in conjunction with a skimming operation. The flushed oil is directed down-slope to skimmers positioned at the water's edge, with booms deployed around the skimmers to prevent any loss of the water.
- Options of using low or high pressure water, and of using ambient temperature water versus warm water or steam.
- Low pressure, cold water is generally the least effective, particularly with sticky oils and emulsions, but is least harmful on the environment.
- High pressure water and heated water and steam are more effective, but may remove and/or kill beach-dwelling organisms.

C. Sediment Removal Techniques

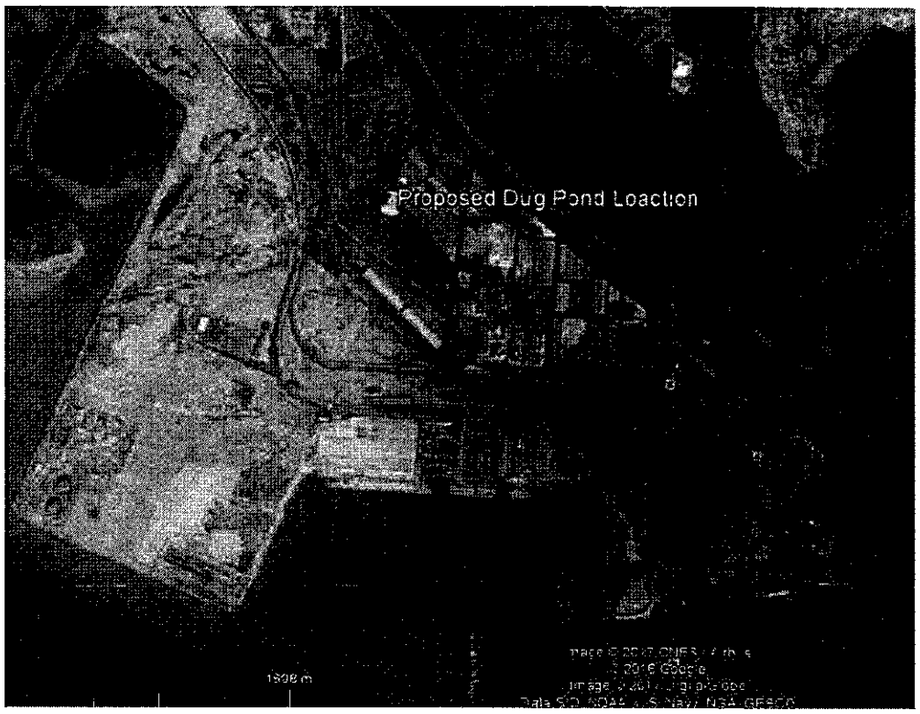
- Applicable to a variety of shoreline types, and in particular, when the shoreline is heavily contaminated, though likely to cause the greatest environmental impact
- The requirements are access for the heavy equipment required for transporting away oily debris and sediments for disposal and a surface which is able to support heavy equipment
- An important factor to consider is the depth of oil penetration
- Important to limit the depth of material removed in order to minimise disturbance to the beach, and to minimise disposal requirements
- The best option is to use manual labour to pick up the oily sediment and mechanical means to transport it away

D. Biodegradation Techniques

- Generally refers to "active" bioremediation, where nutrients and/or microorganisms are applied to enhance natural degradation
- Generally suitable for areas that are lightly oiled, especially lightly oiled salt marshes and tidal flats where the use of equipment could increase the environmental effects by forcing oil into the substrate
- It can also be used as a final clean-up step following more active efforts

The shoreline clean-up operation is normally not an emergency operation as is the case with an oil spill on open water. A clean-up project can last many weeks or months depending on the amount of oil spilled. Many wrong decisions can be made in planning and carrying out a shoreline clean-up operation. The contingency plan must be used in combination with consulting experts with experience of shoreline clean up. The agencies such as NIO, NEERI, Ports and Oil companies have experts with experience which is relevant for the specific oil spill situation and they should be consulted prior undertaking shoreline clean-up.

3.6 Storage and disposal of oil and oily waste



After the natural degradation by coagulation and evaporation of oil on water, residual oil and waste material collected during a Tier 1 response will be disposed off by in-situ or terrestrial burning.

	Type of material	Separation methods	Disposal methods
LIQUIDS	Non-emulsified oils	Gravity separation of free water	Use of recovered oil as fuel or refinery feedstock
	Emulsified oils	Emulsion broken to release water by ; - Heat treatment - Emulsion breaking chemicals - Mixing with sand	Use of recovered oil as fuel or refinery feedstock. Burning Return of separated sand to source.
SOLIDS	Oil mixed with sand	Collection of liquid oil leaching from sand during temporary storage Extraction of oil from sand by washing with water or solvent Removal of solid oil by sieving	Use of recovered oil as fuel or refinery feedstock. Direct disposal Stabilization with inorganic material. Degradation through land farming or composting. Burning
	Oil mixed with cobbles, pebbles or shingle	Collection of liquid oil leaching from beach material during temporary storage Extraction of oil from beach material by washing with water or solvents	Direct disposal. Burning
	Oil mixed with wood, plastics, sea weeds, sorbents	Collection of liquids leaching from debris during temporary storage Flushing of oil from debris with water	Direct disposal. Burning. Degradation through land farming or composting for oil mixed with sea weeds or natural sorbents.
	Tar balls	Separation from sand by sieving	Direct disposal Burning

Location for Dug Pond for temporary storage of oily water:

To store the contaminated oily water, temporary dug pond will be excavated for storage of oily water. It is expected that 20 times volume of oil & water mixture will be generated if oil spill happen in the sea. Storage capacity of dug pond of volume 14000 m3 considering spill of level 1 (Tier-1) is required.

Location Identified for Dug Pond behind Maruti Yard (Lat. 22° 45.252'N , Long. 69° 41.093'E) is roposed.

- Size of Dug Pond to be provided : 100 mtr X 100mtr X 1.5mtr
- Total storage capacity (m3) : considering 20 times oily water @ 700 m3 = 14000 m3

Once the contaminated mixture of oil and water is stored, the same will be transferred via tanker to following location. Following are the steps require to be followed.

1. Oil Water Separator: Capacity 25 m3/hr.
2. Effluent Treatment Plant: Capacity 120 KLD
3. Parallely oil recyclers will be approached for the collection and transportation of the oily water.
4. Contaminated Soil / Sediments will be directly sent to the Treatment Storage and Disposal Facility (TSDF) site. List of Oil recyclers and TSDF sites are shown in Annexure – 15
5. Different types of equipment & manpower require for creating dug pond:

2997

Name of Equipment	**Quantity**	**Primary Responsibility of Equipment & Material**	**Secondary Responsibility**
Excavator	10 Nos.	Marine Dept.	MHS section (Dry Cargo) / Asset Department / Procurement
JCB Machines	10 Nos.	Marine Dept.	ES Civil / Asset Department / Procurement
Material			
HDPE Liners for dug pond	10600 Sq. mtr.	Marine Dept.	Stores & Procurement

In phase wise manner stored oily water will be treated at both the above facility to separate oil from water to the possible extent. Whereas, after recovery of oil from water, water confirming to the effluent discharge limit of oil (< 10 ppm) will be discharged in to sea.

Whereas in case oily water will not capable of treat at OWS & ETP will be dispose through sending it to registered recyclers, for which APSEZL have already done tie up with the registered recyclers as mentioned in **Annexure – 15**.

APSEZL have also done necessary tie up with various institutes/agency/NGO as mentioned in **Annexure – 16** for providing service for rescue & rehabilitation of oil socked birds as well as restoration of mangroves, when oil reaches to the sea shore and mangrove areas during oil spill. Mobile van / vehicle require for rescue of oil socked birds to transfer from affected area to treatment facility center.

4 Equipment

4.1 Marine oil spill response equipment

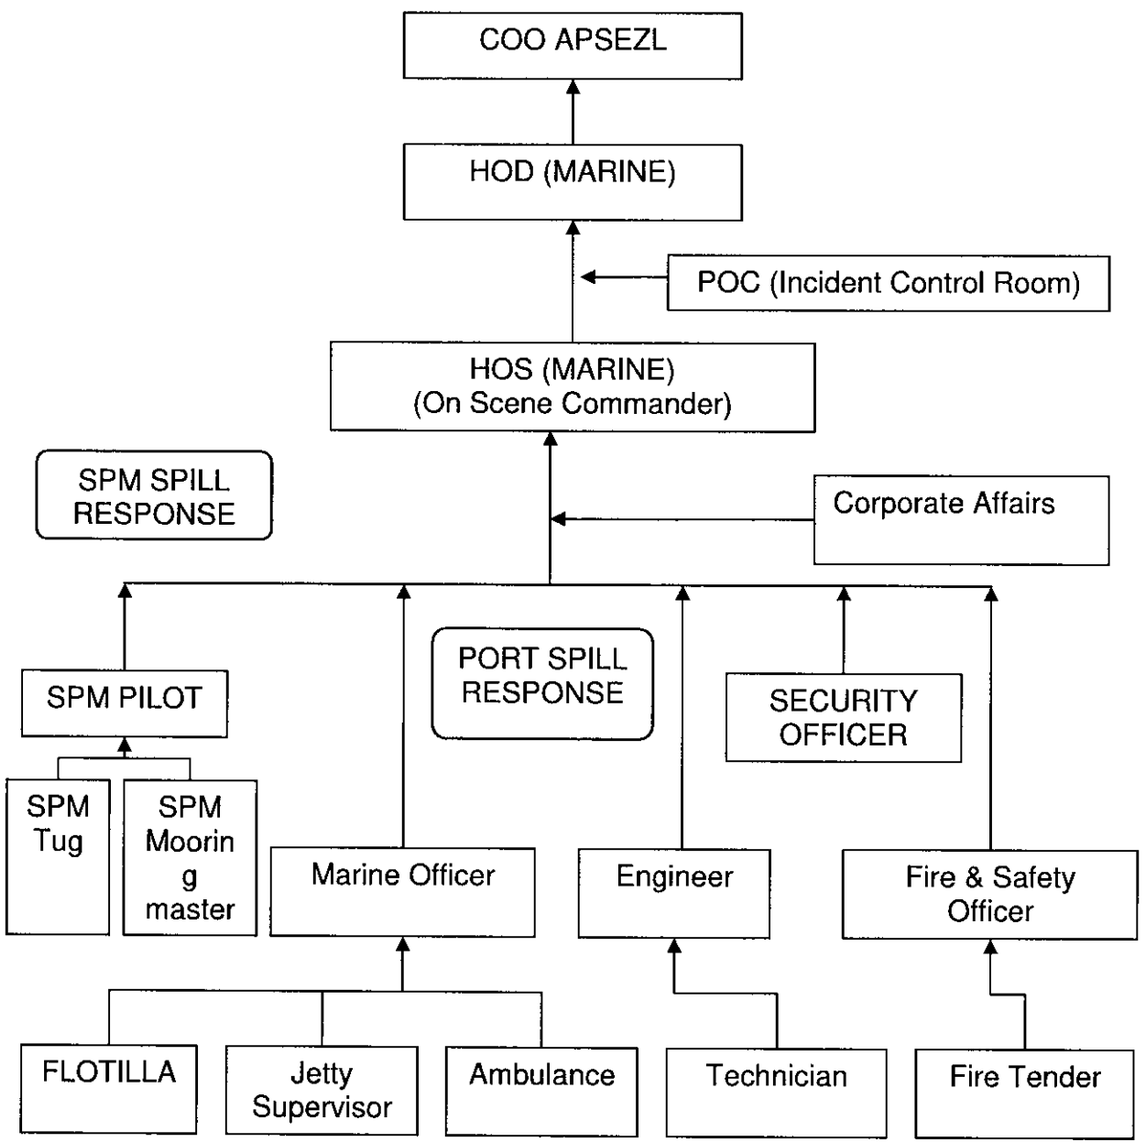
Detailed in Annexure 3

4.2 Inspection, maintenance and testing

The equipments are being kept in working condition. Routine inspection, maintenance and testing performed as per the stipulated requirements.

4.3 Shoreline equipment, supplies and services

The shoreline clean-up equipment which are essential for the oil removal operations at beaches are as follows:-



- Protective clothing for everybody (including boots and gloves), spare clothing.
- Cleaning material, rags, soap, detergents, and brushes.
- Equipment to clean clothes, machinery, etc., with jets of hot water.
- Plastic bags (heavy duty) for collecting oily debris.
- Heavy duty plastic sheets for storage areas especially for the lining of temporary storage pits.
- Spades, shovels, scrapers, buckets, rakes
- Ropes and lines
- Anchors, buoys
- Lamps and portable generators
- Whistles
- First Aid material.

5 Management

5.1 Crisis manager and financial authorities

The COO of APSEZL is the final authority of the oil spill response in case of a Tier 1 scenario. He is responsible for raising the level of the response if required and summoning additional help. The authority of all financial decisions rest with him.

5.2 Incident organization chart

5.3 Manpower availability (on-site, on call)

In an event of incident Kandla Port Trust, Gujarat Maritime Board, Gulf of Kutch Ports, District and Regional plans are deemed to have been implemented. Adani Ports and Special Economic Zone Limited (APSEZL) manpower and resources will be put at the disposal and will be deployed as required, provided APSEZL is the polluter and spill is within the Port Limits.

In the event of APSEZL not being the polluter and any event outside the port limit of Adani Port, APSEZL equipment will be subject to mutual assistance plan and it will be the responsibility of the above forum.

5.4 Availability of additional manpower

Similarly in the event of APSEZL being the polluter, additional manpower and supplies can be requested from the resources which are part of this forum.

A numbers of private parties have their labor force working round the clock in the port and on call these can be available.

5.5 Advisors and experts – spill response, wildlife and marine environment

APSEZL, being the nodal agency in this LOS-DCP, will function as the main agency. In the event of the emergency getting raised to higher tier, i.e. in case the incidence becomes a national disaster, the help and advice of Indian Coast Guard will be taken.

5.6 Training / safety schedules and drill / exercise programme

Training of all APSEZL staff who may get involved in implementing this plan is acknowledged. In house and external facilities (of ICG) are used periodically to impart training as per matrix below. Marine Manager has been appointed as training coordinator and custodian of oil pollution equipment. He shall organize training, drills and inspection of equipment as per the plan in force.

Training Module	Duration	Frequency	Participants	Remarks
IMO Model Course	2-5 days	Once	Key persons	By Maritime Training Institute
Oil Spill	1-5 days	Once every 5 years	Key persons	Coast Guard
Oil spill equipment	1-5 days	Once every Year	Managers	In house
Oil spillManagement course	1 day	Once every year	Managers & junior staff	In house for in-depth knowledge
Notification exercise	1-2 hours	6 months	Operational staff	Check systems & communication
Table top	2-6 hours	12 months	Managers	Interactive discussions
Incident	6-8 hours	12 months with others	All	Mock drill

Number of IMO Level-1 and IMO Level-2 qualified staff available with Adani Ports and SEZ Ltd, Mundra:
IMO Level-1 - 30
IMO Level-2 - 03

3001

6 Communications

6.1 Incident control room facilities
Detailed in Annexure 3

6.2 Field communication equipment
Detailed in Annexure 3

6.3 Reports, manuals, maps, charts and incident logs
A copy of the relevant manual is kept with HOD – Marine. Maps/ Charts of APSEZL are kept in Marine Control Tower and attached in Annexures

Action and operations

7 Initial procedures

7.1 Notification of oil spill to concerned authorities

The emergency (due to spill) should be initiated by the first person noticing it by activating the fire alarm from the nearest call-point or by contacting the fire control room immediately on the internal telephone or through mobile phone or through VHF Channel.

The SPM Pilot or On Scene Commander will report the spill to the Marine Control Room.

7.2 Preliminary estimate of response tier

The first few minutes after the incident / accident are invariably the most critical period in prevention of escalation. Therefore the person available at or near the incident site (and often responsible for carrying out that particular activity) on round the clock basis play a vital role in an emergency. The SPM Pilot or On Scene Commander will report the spill to the control room along with his estimate of the response tier.

7.3 Notifying key team members and authorities

Statutory First Information Report (FIR - given in annexure 1) is to be communicated by fastest means possible to President, GMB port and CG at Porbandar followed by full Pollution Report (POLREP – given in annexure 2). The report is to be updated, should the oil spill not be contained and likely to increase to Tier 2

7.4 Manning Control Room

Auxiliary control center is located at Port Operation Centre. Escalation of emergency if any is monitored here. Statutory reporting procedures of FIR and POLREP of developing situation and action taken are also sent from this center. The detail of the contacts to whom the information is to be given is placed at Annexure 4.

7.5 Collecting information (oil type, sea / wind forecasts, aerial surveillance, beach reports)

Marine Manager has the responsibility of arranging the collection of the relevant information which will help in mitigating the emergency

7.6 Estimating fate of slick (24, 48, 72 hours)

Considering the prevalent tidal stream, wind and weather conditions, section 8.3 is to be used in estimating the fate of the slick

7.7 Identifying resources immediately at risk, informing parties

Depending on the quantity of fluid spilled and the prevalent wind & weather conditions, the resources / facilities immediately at risk have to be identified by the On scene commander and the concerned parties informed.

8 Operations planning

8.1 Assembling full response team

On being appraised of the spill, the duty marine officer will inform the marine manager, who will, in turn initiate the assembly of the complete response team which essentially involves relaying information to all relevant personnel, parties and authorities and informing them of the initial response requirements.

8.2 Identifying immediate response priorities

Depending on the initial estimated response tier and the prevalent weather conditions, the marine manager, in consultation with the on scene SPM pilot / marine officer will identify the immediate resources at risk and the response priorities.

8.3 Mobilizing immediate response

The Manager - Marine will initiate the mobilization procedure of the spill equipment, resources and personnel depending on the scale of emergency at hand.

8.4 Media briefing

No other person is authorized to communicate with any external party by any means whatsoever unless expressly permitted by the HOD – Marine or COO, APSEZL.

8.5 Planning medium-term operations (24, 48 and 72 hour)

The HOD – Marine will plan the subsequent action to be taken in response to the tier 1 spill after the initial response is well under way and its consequences / effectiveness are duly evaluated.

8.6 Deciding to escalate response to higher tier

After carefully assessing the scenario and appraising the efficiency of the initial response in the prevalent conditions, the HOD – Marine will decide whether or not to escalate the response.

8.7 Mobilizing or placing on standby resources required

It is recommended that in case of a doubt (as the exact estimate of the quantity of oil spilled is quite difficult and the boundaries between the tiers will inevitably be blurred) it is important to be prepared to involve the next higher tier from the earliest moments. It is easier to stand down an alerted system than to try to escalate a response by calling up unprepared reserves at a late stage.

8.8 Establishing field command post communications

Communications between the Emergency Response Center/ Marine Control room and marine personnel during the response to any oil spillage will be primarily by VHF marine band radio on Channel 73 or 77

Communications between the Marine Control Room and other vessels will be established on VHF radio Channel 16 and will thereafter be conducted on Channel 73 / 77.

Use of cellular telephones will be minimized.

Communications between the Emergency Response Center/ Marine Control Room and external authorities and organizations will be undertaken by telephone and facsimile.

9 Control of operations

9.1 Establishing a Management team with experts and advisors

Detailed in Annexure **4**

9.2 Updating information (sea, wind, weather forecasts, aerial surveillance, beach reports)

The Marine Control Room is well equipped in assimilating data on weather and its forecasts. In case of a Tier 1 response, aerial surveillance and beach reports are not deemed to be essential

9.3 Reviewing and planning operations

Ongoing response and its influence in mitigating the situation will have to be constantly under review in order to contain the spill at the earliest.

9.4 Obtaining additional equipment, supplies, manpower

While deciding not to elevate the tier of the response the HOD- marine may still request additional resources from nearby port facilities which are essentially members of the common forum and are obliged to assist.

9.5 Preparing daily incident log and management reports

A complete report will be submitted by the Marine Manager to the HOD (Marine) every morning (in case the response extends to more than 1 day).
Format for the above report in Annexure 9

9.6 Preparing operations accounting and financial reports

The Port's accounting department will assess the expenditure incurred in the ongoing operation and submit a report to the President's office.

9.7 Preparing releases for public and press conferences

The COO's office, HOD – Marine and the Corporate communications cell will formulate the requisite press releases from time to time and hold press conferences.

9.8 Briefing local and government officials

The COO's office, HOD – Marine and the Corporate communications cell will formulate the requisite reports to brief local and government officials..

10 Termination of operations

10.1 Deciding final and optimal levels of beach clean-up

If at all a distant beach is affected, the COO APSEZL office will decide the optimal levels of cleanup in consultation with the conservator of the port – Gujarat Maritime Board Port Officer.

10.2 Standing down equipment, cleaning, maintaining, replacing

Considering the natural disintegration of the residual oil on water after the cleanup of the bulk amount, The HOD – Marine will decide when to stand down the response. The resources which have been used will have to be re-instated to the original condition by elaborate cleanup or replacement.

10.3 Preparing formal detailed report

The COO's office, HOD – Marine and the Corporate communications cell will formulate the requisite reports to brief local and government officials and media.

10.4 Reviewing plans and procedures from lessons learnt

A complete spill response report will be produced by the Marine manager providing comprehensive and all-inclusive details of the circumstances leading to the spill, initial response and consequent affect of the same, subsequent follow up, effect of prevailing weather, adverse situations, safety issues, difficulties faced and lessons learnt.
Requisite changes will be affected to this plan on basis of such report.

Such a report will also be prepared by the marine manager after each drill or training session and requisite modification(s) incorporated to the plan in order to enhance the overall efficacy of the same.

Table-3.1: Properties of Crude Oil, FO and Diesel

Sl. No	Chemical	Boiling Range (° C)	Specific Heat of Liquid (J/Kg ° K)	Heat of Evaporation (x 10^5 J/Kg)	Heat of Combustion (x 10^5 J/Kg)
1	Crude Oil	IBP - 700+	2385	3.4	425
2	HSD	200 - 350	2889	4.65	448
3	Fuel Oil	180 - 450	2500	3.4	452

The following characteristics of oil are used for modelling study:

(a) Crude Oil
Sp. Gr = 0.82 to 0.88
Surface Tension =3.0 e-03
Molar Volume =0.002
Viscosity: 275 CST at 37.8 deg C
Wax content: 12 – 19 %
Pour point of untreated crude: 30 deg C
Pour point of treated crude: 18 deg C

(b) FO
Sp. Gr = 0.92
Boiling point = > 260^0 C
Vapor pressure = < 0.1 psia at 21^0 C

(c) HSD
Sp. Gr = 0.86
Pour point = 6^0 C - 18^0 C
Vapor pressure = 2.12 to 26 mm Hg at 21^0 C

2. Wind and weather

Meteorological and Oceanographic Conditions

The met-ocean conditions have been previously ascertained at several stages in the course of various studies conducted in past in respect of Mundra port projects. Flow modeling for the Mundra port location has been covered in the model developed by Environ, India, who have developed the model for whole of Gulf as relevant to Mundra region. It has been observed during model studies that flow regime does not have significant changes due to the proposed developments. The following are the main hydo-meteorological parameters for planning and designing of the marine facilities described below.

Rainfall and Temperature

The Kutch is a semi-arid region with weak and erratic rainfall confined largely to June-October period. With a few rainfall days, the climate is hot and humid from April till October and pleasant during brief winter from December to February. Although the monthly mean maximum temperature recorded is 37°C during 2005, it occasionally exceeds 40°C. Rainfall alone forms the ultimate source of freshwater resource to the region. The average rainfall at Mundra is about 400 mm/year.

Lists

1. **Primary Oil spill Equipment:** booms, skimmers, spray equipment, dispersant, absorbents, oil storage, Radio communications etc.

   Detailed in Annexure **3**

2. **Auxiliary Equipment:** Tugs and work boats, aircraft, vacuum trucks, tanks and barges, loaders and graders, plastic bags, tools, protective clothing, communication equipment etc.

   Detailed in Annexure **3**

3. **Support Equipment:** Aircraft, communications, catering, housing, transport, field sanitation and shelter etc. (Availability, contact, cost and conditions)

   Not applicable

4. **Sources of Manpower:** Contractors, local authorities, caterers, security firms (Availability, numbers, skills, contact, cost and conditions)

   Refer Para 5.3

5. **Experts and Advisors:** Environment, safety, auditing (Availability, contact, cost and conditions)

   Detailed in Annexure **4**

6. **Local and National Government contacts:** Name, rank and responsibility, address, telephone, fax, telex.

   Detailed in Annexure **4**

Data

1. **Specification of Oils commonly traded**

At the liquid berth, the representative products that would be handled are petroleum products like FO/ HSD / SKO / MS / CBFS / CPO / Naphtha etc. Vessels calling at the port will be having FO and HSD for their propulsion requirements.. The products like MS, Naphtha etc are oils of non – persistent nature; they tend to evaporate fast and will not stay long on the surface of the sea waters. Hence spill studies have been carried out for FO and HSD spills at the berths.

At the SPMs, Crude oil unloading takes place.

Physical and Chemical Properties of products handled at the SPMs, Berths and of the propulsion fuels of the ships / tankers

Data on the properties for the hydrocarbons / products handled at the jetty is required for quantitative hazard identification and consequence calculations. The properties of the FO and HSD, the petroleum hydrocarbons likely to be spilled due to the operations at the jetty are given in Table-3.1.

Cyclones

Cyclonic disturbances strike North-Gujarat, particularly the Kachchh and Saurashtra regions, periodically. These disturbances generally originate over the Arabian Sea and sometimes the Bay of Bengal. Generally during June, the storms are confined to the area North of 15°N and East of 65°E. In August, the initial stages, they move along the northwest course and show a large latitudinal scatter. West of 80°E, the tracks tend to curve towards North. During October the direction of movement of a storm is to the West in the Arabian Sea. However, East of 70E some of the storms move North-Northwest and later recurves North East to strike Gujarat-North Mekran coast.

Wind

There are strong winds at times at Mundra Port. The month wise wind rose diagrams for the year 2012 and for the months of January and February of the year 2013 are given below. In the period lasting over months March to May the wind direction is generally SWW (225° - 250°) and velocity varies from 20 to 25 Knots. From June through August, the wind direction is predominantly SW and velocity varies from 25 to 30 Knots with short gusts going up to 35 to 40 Knots. Towards end of September and through October wind direction changes to NE with velocities ranging from 7 to 10 Knots. Direction remaining same the velocity varies 10 knots to 25 Knots in the period November to January. February is the calm period when wind direction is Southerly with velocity in the range of 7 Knots. Stormy weather may generate winds having velocity up to 100 Knots which should be taken as the worst case scenario for design of tall structures and heavy duty cranes.

3021

Tides

The tidal planes were assessed in 1998 and are as shown in Table below.
The Highest Astronomical Tide (HAT) is estimated to be about +6.4 m above chart datum (CD), and the Lowest Astronomical Tide (LAT) to be at 0.0 m CD.

Tide	Height (m) above CD
Mean High Water Springs	5.8
Mean High Water Neaps	4.6
Mean Low Water Neaps	2.1
Mean Low Water Springs	1.0

Currents

Currents in the approaches to the port are dominated by the tidal flows, with predictable variations over diurnal, monthly and annual time scales. Currents in this part of the Gulf flow parallel to the natural sea-bed contours. Currents can be relatively strong, with speeds in excess of 3.0 Knots reported at sometimes of the year. The Admiralty Chart shows currents off Navinal point to be 3.0 Knots East & West bound. It is observed that the currents are usually aligned with the bed contours and are stronger in deeper waters off the coast. The impact of future development over the existing coast-line can be determined by the change in current speed resulting from the proposed developments.

Waves

In past HR Wallingford (HRW) has studied the wave climate considering wave energy from locally generated waves and swell propagating in to the Gulf of Kutch from the Arabian Sea. The results of the study carried out by HRW are presented in the Table below.

Design Waves at Mundra

Direction Sector (°N)	Return Period (years)	Inshore Direction (°N)	Hs (m)	T2 (sec)
210	1	222	1.2	5.0
	5	222	1.4	5.3
	20	221	1.6	5.8
	100	221	1.8	6.1
240	1	226	1.5	5.4
	5	226	1.7	5.8
	20	225	1.8	6.1
	100	225	2.0	6.5
270	1	239	1.4	5.5
	5	236	1.7	6.3
	20	236	1.8	6.7
	100	235	2.0	7.4
300	1	240	0.8	5.2
	5	240	0.9	5.6
	20	239	1.0	6.2
	100	238	1.2	6.7

Atmospheric stability is an important factor for predicting the dispersion characteristics of gases/vapours into the surrounding environment. Change in atmospheric stability is a direct consequence of the vertical

temperature structure. The stability effects are mathematically represented through Pasqual parameters. The following stability classification is employed:

Stability Class	Atmospheric Condition
A	Very Unstable
B	Unstable
C	Slightly Unstable
D	Neutral
E	Stable
F	Very Stable

Condition of atmospheric stability is estimated by a suitable method that uses dispersion parameters viz., vertical temperature gradient, profile of the winds and roughness factor. The roughness factor for the Mundra area is small since it mainly comprises of plain land.

The following meteorological information has been taken in the calculations for the Mundra area (GMB-2010):

Average ambient temperature : 30°C
Average wind speed : Wind data for the whole year 2012 is available and is used
Stability condition : F (Very Stable)

3 Information sources

This plan is prepared in accordance with:

a) Marine Environmental Impact Assessment of SPMs, COTs and connecting pipelines of APSEZL at Mundra dated February 2001, prepared by National Institute of Oceanography, Mumbai.
b) Report on Risk assessment study and On-site disaster management Plan for SPMs, COTs and connecting Pipelines of Adani Ports and Special Economic Zone Limited, by TATA AIG Risk Management Services Limited, dated February 2001.
c) HAZOP study report of SPM Terminal pipeline project by Intec Engineering, dated 26/02/2004.
d) IPIECA guide to Contingency planning for oil spills on water.
e) Oil spill risk assessment and contingency plan study done by M/s Environ Software Pvt. Ltd. (Copy enclosed)

ANNEXURES

INITIAL OIL SPILL REPORT		**ANNEXURE 1**
Particulars of person, office reporting		
Tel No.		
Date & time of incident		
Spill location		
Likely cause of spill		Witness
Initial response action		By
Any other information		

This FIR is to be sent to Marine Manager by fastest means of communication possible. It is an offence not to report oil pollution incident.

This FIR is to be followed by company's incident report also.

Following POLREP report to the Government through nearest CG information will also be required:

Identity of informant	
Time of FIR	
Source of spill	
Cause of spill	
Type of spill	
Colour code information (from CG)	
Radius of slick	
Tail	
Volume	
Quantity	
Weather	
Tide / current	
Density	
Layer thickness	
Air / Sea temp.	
Predicted slick movement	
Size of spill classification (Tier 1, 2 or 3)	

POLREP **ANNEXURE 2**

In case of an oil spill, APSEZ will provide information to Commandant Coast Guard District 1 Porbandar COMDIS 1 and Coast Guard Station Mundra in the following format:

SN.	Parameter	Data
1.	Identity of the informant	
2.	Time of information receipt	
3.	Source of Spill	
4.	Cause of Spill	
5.	Type of oil	
6.	Colour code information	
7.	Configuration	
8.	Radius	
9.	Tail	
10.	Volume	
11.	Quantity	
12.	Weathered or Fresh	
13.	Density	
14.	Viscosity	
15.	Wind	
16.	Wave Height	
17.	Current	
18.	Layer Thickness	
19.	Ambient air temperature	
20.	Ambient sea temperature	
21.	Predicted slick movement	
22.	Confirm Classification of spill size

Dolphin No. 15	ASD	3000 X 2	3000 ltr	2000 ltr	1200	70
Dolphin No. 16	ASD	3000 X 2	3000 ltr	2000 ltr	1200	70
Dolphin No. 17	ASD	3000 X 2	3000 ltr	-	-	70
Dolphin No. 18	ASD	3000 X 2	3000 ltr	2000 ltr	1200	70
Khushboo	Fixed screw	401 X 2	-	-	-	10

Dolphin No. 3, 4, 7, 10, 11, 14, 15, 16, 17 & 18 are fitted with Oil Spill Dispersant boom and proportionate pump to mix OSD and Sea water as required. Dolphin No.3, 4, 7, 11, 14, 15, 16, 17 & 18 are fitted with a fire curtain and remote controlled fire monitors.

All above eleven Tugs have class notation as Harbour Tugs and are certified to work within the Harbour limits only.
Reception Facility : 12" pipe line, connected to a slop tank at chemical tank farm.

Dolphin 11 has fire fighting system of 1200 m3/hr along with 20 ton lifting "A" frame and diving support facility.

Location of Oil Spill Equipment: The Oil Spill Equipments are stored in SPM Store.

Resources / Equipment Available with APSEZL, Mundra

Item	Quantity
Canadyne Fence Boom (Reel model 7296/8496 with Power Pack, Towing bridles and Tow lines - 235 meter	1 no
Power pack with boom reel with hydraulic hoses	2 nos.
Power pack - 20 KV with boom reel with hydraulic hoses	2 nos.
Lamor Side Collector system (Recovery Capacity 123 m³/ hr) (Side collector LSC-3C/2300(01C02-P536). Oil transfer pump OT A 50 with oil transfer hose set	2 nos. 2 sets
Lamor Minimax 12 m³ skimmer	2 sets
Power pack for skimmers with hydraulic hoses	4 nos.
Power pack - 20 KV for skimmers with hydraulic hoses	1 no.
Floating tank (25 m³)	1 nos.
Foot pumps for floating tank	6 nos
Oil Spill Dispersants	5000 ltr
Portable dispersant storage tank: 1000 ltr capacity	1 no.
Portable pumps	2 nos.
Two – way hydraulic maneuvering panel	2 nos
Oil Containment Boom-Length 2000 metres, Height -1500 mm, Draft-900mm, Free Board-600mm	2000 mtr

OIL SPILL CONTINGENCY RESPONSE PLAN

	Marine Officer/ SPM Mooring master	**ANNEXURE 5**
Responsibilities	• Observe or receive report of oil or chemical spill incident • Initiate measures to prevent/ reduce further spillage • Maintain communication with other all vessels	
Step	**Actions**	**Additional Information**
Alert	(Marine Manager / On Scene Commander / SPM Pilot Tugs and other support/ response craft	*VHF Channel 73 / 77*
Initial Actions	Stop all cargo operations Ensure all safety precautions taken/observed Verify incident details Advise all relevant information to (Marine Manager / On Scene Commander / or SPM Pilot Initiate personal log Place tugs/other response craft on stand-by	*Liaise with Terminal Shift Engineer*
Further Actions	Brief (Marine Manager / On Scene Commander / SPM Pilot as necessary Mobilize response equipment/ personnel as directed by (Marine Manager / On Scene Commander / Maintain personal log of communications and events Act as instructed by (Marine Manager / On Scene Commander / SPM Pilot	
Final Actions	Submit personal log to HOD – Marine Attend debrief	

	MARINE MANAGER / On Scene Commander ANNEXURE 6	
Responsibilities	• Initially assess situation • Verify classification • Verify fate of spill • Verify resources immediately at risk, inform parties • Provide accurate situation reports to Radio Room/ HOD – Marine • Collect evidence and/ or statements • Liaise with HOD-Health, Safety, Environment & Fire • Liaise with incident vessel regarding status of oil spill (if applicable)	
Step	**Actions**	**Additional Information**
Alert	HOD – Marine	
Initial Actions	Proceed to incident location, assume role of On-Scene Coordinator Ensure all safety precautions have been taken Initiate response / Investigate cause/ source of spill Communicate all information to HOD – Marine Ensure samples of spilled oil taken Initiate personal log Take photographic evidence Collect evidence and take statements	*Stopped or ongoing*
Further Actions	Ensure resources are being deployed as required Provide co-ordination at-sea response Provide detailed situation reports to HOD- Marine Liaise with -Health, Safety Environment & Fire Department.	
Final Actions	Submit personal log to HOD – Marine Attend debrief	

3037

3031

	SPM Pilot	ANNEXURE 7
Responsibilities	• Initially assess situation • Verify classification • Provide accurate situation reports to Radio Room/ OSC • Collect evidence and/ or statements • Liaise with incident vessel regarding status of oil spill (if applicable)	
Step	**Actions**	**Additional Information**
Alert	☐ Marine Control Room ☐ OSC ☐ Tugs and other support / response crafts	*VHF Channel 73 / 77*
Initial Actions	Assume role of On-Scene Coordinator Investigate cause/ source of spill Communicate all information to Marine Control Room Ensure samples of spilled oil taken Initiate personal log Take photographic evidence Collect evidence and take statements	*Stopped or ongoing*
Further Actions	Ensure resources are being deployed as required Provide co-ordination of the at-sea response Provide detailed situation reports to HOD – Marine	
Final Actions	Submit personal log to HOD – Marine Attend debrief	

	HOD – Marine	ANNEXURE 8
Responsibilities	• Confirm/ amend initial classification • Manage the APSEZL response • Authorize expenditure after consultation with COO APSEZL • Brief COO, APSEZL • Liaise with Coast Guard • Approve press statements for release	
Step	**Actions**	**Additional Information**
Alert	Coast Guard External organizations	
Initial Actions	Verify/ amend spill classification Ensure all safety precaution have been taken Confirm external organizations have been alerted Convene Emergency Response Team Predict slick movement Liaise with vessel Agents/ Owners as appropriate	
Further Actions	Chair the Emergency Response Team meetings Constantly review the strategy being employed and advise of changes where necessary Approve all expenditure commitments Brief President APSEZ Agree press statements with Corporate Relations Chief Confirm formal samples have been taken Advise Coast Guard if oil migrates outside of Local Area	
Final Actions **Final Actions (contd.)**	Terminate the clean-up Collate personal logs. Prepare the incident report. Hold full de-brief involving all members. Amend contingency plan as required. General Report to President

SKO	Super Kerosene Oil

Certificate of Endorsement

(To be certified personally by an officer not below the post of Deputy Conservator of a port facility or the Installation Manager of an oil installation, or offshore installation, or equivalent legally responsible authority)

I hereby certify that:

1 The oil spill contingency plan for the facility under my charge has been prepared with due regard to the relevant international best practices, international conventions, and domestic legislation.

2. The nature and size of the possible threat including the worst case scenario, and the resources consequently at risk have been realistically assessed bearing in mind the probable movement of any oil spill and clearly stated.

3. The priorities for protection have been agreed, taking into account the viability of the various protection and clean-up options and clearly spelt out.

4. The strategy for protecting and cleaning the various areas have been agreed and clearly explained.

5. The necessary organization has been outlined, the responsibilities of all those involved have been clearly stated, and all those who have a task to perform are aware of what is expected of them.

6. The levels of equipment, materials and manpower are sufficient to deal with the anticipated size of spill. If not, back-up resources been identified and, where necessary, mechanisms for obtaining their release and entry to the country have been established.

7. Temporary storage sites and final disposal routes for collected oil and debris have been identified.

8. The alerting and initial evaluation procedures are fully explained as well as arrangement for continual review of the progress and effectiveness of the clean-up operation.

9. The arrangements for ensuring effective communication between shore, sea and air have been described.

10. All aspects of plan have been tested and nothing significant found lacking.

11. The plan is compatible with plans for adjacent areas and other activities.

12. The above is true to the best of my knowledge and belief.

13. I undertake to keep the plan updated at all times and keep the Indian Coast Guard informed of any changes through submission of a fresh certificate of endorsement.

Contingency Planning Compliance Checklist

Name of the Port/ Oil Handling Agency	Adani Ports and SEZ Limited, Mundra

	DESCRIPTION	Complied Yes/No	Remarks
Risk Assessment			
1.	Whether the facility produces / handles / uses / imports / stores any type of petroleum product.	Yes	**(Ref. OSCRP 2.2)**
2.	Whether risk assessment is done	Yes	**(Ref. OSCRP 2.0)**
3.	Who did the risk assessment	Yes	Environ Software (P) Ltd. & APSEZ
4.	Whether maximum volume of oil spill that can occur in the worst case scenario is considered.	Yes	**(Ref. OSCRP 2.4)**
5.	Whether relative measures of the probability and consequences of various oil spills including worst case scenario are taken into account.	Yes	**(Ref. OSCRP 2.4)**
6.	Whether all types of spills possible in the facility are considered including grounding, collision, fire, explosion, Rupture of hoses.	Yes	**(Ref. OSCRP 2.3 & 2.4)**
7	Please specify the list of oils considered for risk assessment	Yes	**(Ref. OSCRP 2.2)**
8	Whether the vulnerable areas are estimated by considering maximum loss scenario and weather condition	Yes	**(Ref OSCRP 2.1 Computational Scenarios)**
9	Whether impacts on the vulnerable areas are made after considering the marine protected areas ,population ,fishermen ,saltpans ,mangroves ,corals, and other resources within that area	Yes	**(Ref. OSCRP 2.6)**
10	Whether measures for reduction of identified high risk are included by reducing the consequences through spill mitigation measures	Yes	**(Ref. OSCRP 1.4, 2.3, 2.6. 3 & 5)**
11	Whether steps have been considered to reduce risks to the exposed population by increasing safe distances by acquiring property around the facility ,if possible	NA	All facilities developed within SEZ keeping safe distances from the exposed population.
12	Whether risk levels are established for each month after considering the probability with tide and current and consequences of each such spill	Yes	**(Ref. OSCRP 2.1 computational scenarios & 2.3)**
13	Whether prevention and mitigation measures are included in the plan	YES	**(Ref. OSCRP 4.0, 7.0, 8.0 & 9.0)**
14	Whether the spill may affect the shoreline.(length of the shoreline with coordinated)	Yes	**Ref. OSCRP 2.3 & 2.6)**
15	Whether time taken the oil spill to reach ashore in each quantity of spill in various month are mentioned in the plan	Yes	**(Ref. OSCRP 2.3)**
16	Whether sensitivity mapping has been carried out	Yes	**(Ref. OSCRP 2.5)**
17	Does the sensitivity mapping clearly identify the vulnerable areas along with MPAs, corals fishermen community, saltpans, mangroves and other socio-economic elements in the area	Yes	**(Ref. OSCRP 2.5 & 2.6)**

18	Do the sensitivity maps indicate area to be protected on priority	Yes	**(Ref. OSCRP 2.6)**
19	Does the maps indicate boom deployment locations	NA	Booms not deployed permanently
20	Whether any marine protected area will be affected	YES	**(Ref. OSCRP 2.5 & 2.6)**
21	Whether total number of fishermen likely to affected is mentioned in the plan	Yes	**(Ref. OSCRP 2.6)**
22	Whether any saltpan in the area is going to be affected	Yes	**(Ref. OSCRP 2.6)**
23	Whether any mangroves in the area will be affected by a spill	Yes	**(Ref. OSCRP 2.6)**
Preparedness			
24	whether any containment equipment is available	Yes	**(Ref. OSCRP Annex 3)**
25	Whether any recovery equipment is available	Yes	**(Ref. OSCRP Annex 3)**
26	Whether the facility is having any temporary storage capacity	Yes	**(Ref. OSCRP Annex 3)**
27	Whether location of the oil spill response equipment is mentioned in the plan	Yes	Has been included in Annex 3
28	Whether suitable vessels available for deploying the boom skimmer etc.	Yes	**(Ref. OSCRP Annex 3)**
29	Whether OSD held with facility	Yes	**(Ref. OSCRP Annex 3)**
30	Whether the OSD held with the facility is approved for use in Indian waters	Yes	
31	Whether the facility has MoU with other operator for tier -1 preparedness	Yes	**(Ref. OSCRP 1.4)**
32	Whether the list of oil spill response equipment available with each agency in deliberation	Yes	MoU document
33	Whether the facility has any MoU with private OSRO	NA	Port itself is equipped to deal with oil spill emergencies
34	Whether the procedure for evoking the mutual aid is clearly described in the plan	Yes	**(Ref. OSCRP 1.4)**
35	Whether additional manpower is available	Yes	**(Ref. OSCRP 5.4)**
36	Whether list of approved recyclers is mentioned in the plan	Yes	List of recycler approved by state of Gujarat is included in Annexure 15.
37	Whether NEBA (net environmental Benefit Analysis) has been undertaken	Yes	Before commissioning of any new project, various environmental aspects with their positive or adverse impact is considered under EIA Environment Impact Assessment stage.
38	**Whether the areas from priority protection have identify in the plan**	YES	**(Ref. OSCRP 2.5 & 2.6)**
39	Whether relevant authorities and stakeholder were consulted for NEBA and during the areas for property protection	Yes	Before commissioning of any new project Environment Impact Assessment & Public consultation is carried out, in which relevant authorities & stakeholders

			were consulted.
40	Whether district administration has been appraised of the risk impact of oil spills?	Yes	District Level Disaster Management Plan is prepared and regularly updated at district level by District Collector of Kutchh. Under DMP Oil spillage contingency is identified as risk. During preparation & updating of disaster management plan, District Level Authority organises & compiles information from various industries of kutchh. APSEZL is regularly participating in the same & providing necessary information to district level administration.
Action Plan			
41	Whether the plan outlines procedure for reporting of oil spill to coast guard	Yes	**(Ref. OSCRP 7.3)**
42	Whether the oil spill response action is clearly mentioned	Yes	**(Ref .OSCRP 3.1 to 3.6)**
43	Whether the action plan include all duties to be attended in connection with an oil spill	Yes	**(Ref. OSCRP 3.4)**
44	Whether the action plan includes key personnel by their name and designation viz. C/C, S/C	Yes	**Ref. OSCRP Annexure-4**
45	Whether alternate coverage is planned to take care of the absence of a particular person [in cases where action plan is developed basic names]	Yes	**(Ref. OSCRP 5)**
46	Whether the plan includes assignment of all key coordinators viz.the communication controller ,safety coordinator ,Emergency management team, Administration and communication coordinator and safety coordinator	Yes	**(Ref. OSCRP 3.4)**
47	Whether contact directory containing numbers of key response and management personnel is intimated in the plan	Yes	Ref. OSCRP Annexture-4
48	Whether approved recyclers are identified for processing recovered oil and oily debris	Yes	List of approved recycler of Gujarat state is included in annexure 15. Membership of common disposal facility for disposal of oily debris is also attached annexure 16.
49	Whether the shoreline likely to be affected is identified	Yes	**(Ref. OSCRP 2.5 & 2.6)**
50	Whether final report on the incident is submitted to CGHQ as per NOS-DCP 2014	NA	**No incident**
51	Whether the spill incident and its consequences	NA	**No incident**

	are informed to fishermen and other NGOs for environment protection through media		
	Training and exercises		
52	Whether mock fire /emergency response drills are specified in the plan	Yes	**(Ref. OSCRP 5.6)**
53	Whether the mock drills cover all types of probable oil spill	Yes	
54	Whether the plan mentions list of trained manpower	Yes	**(Ref. OSCRP 5.6)**
55	Whether record for periodic mock drill are maintained in a well-defined format	Yes	
56	Whether the plan updated according to the finding in mock-drills and exercises	Yes	
	DESCRIPTION		
57	What is the frequency of updation /review of contingency plan?	Yes	As Per NOSDCP 2015
58	Periodicity of joint exercises with mutual aid partner	Yes	
59	Frequency of mock-drills for practice	Yes	**(Ref. OSCRP 5.6)**
60	Whether the records for periodic mock drills are maintained in a well-defined format	Yes	**(Ref. OSCRP 5.6)**
61	Whether the plan is updated according to the finding of mock-drills and exercises	Yes	
62	Frequency of updation /review of contingency plan	Yes	As Per NOSDCP 2015

I, hereby ,declare that the all information appended above and true and correct to my knowledge of belief

Date	:	25.01.2019
Time	:	11:45 AM
Location	:	Liquid Terminal – Enclosure-09 (Tank No. 117)
Type/Text of the Scenario	:	MTBE (Methyl Tert-Butyl Ether) leakage from the body valve of T – 117, catches fire and two person found unconscious due to inhalation

INTRODUCTION:

Loading in charge Mr. Jayesh Parmar observed leakage of MTBE and found that two people were unconscious at near body valve of T – 117 and simultaneously observed that fire has taken place in the area. He immediately informed Liquid Control In charge Mr. Vikas Dhole for ascertaining the situation.

Immediately POC, Fire and OHC were informed. POC subsequently intimated the same through message/ call to concern departments.

	support.		
Availability and response of emergency kit / equipment / Other.	Emergency kit was immediately mobilized at the incident spot	3	
Audibility of the scenario on PA System by Persons	Security vehicle PA system is audible during evacuation of people.	3	

Good Observations:

1. Fire extinguisher was immediately used by Liquid Terminal staff for extinguishing the fire at initial stage
2. Causalities were immediately rescued by fire team with use of SCBA set.
3. MSDS was referred during the emergency handling by incident controller.
4. Spill kit was mobilised at the incident spot to control/ contain the spillage of cargo.
5. Communication / Information on emergency conveyed to all concern by POC & incident controller.
6. Use of spark proof tools along with PP tool box was observed by maintenance team.
7. PA system was used for evacuation of people by security system.
8. Response of emergency agencies was satisfactory (i.e. OHC, Fire, Security, OHS, Environment, etc.)
9. HR & Admin team reached on time and performed the duty of head count and providing required resources.

Observer – I & II: Mr. Manan Bhatt & Mr. K R Rao

1. Emergency siren was blown after 2 mins from the declaring of emergency. Person at the control room was not aware of the procedure to blow the siren.
2. Communication of incident controller with the emergency services at the site was lacking to some extent.
3. Person with proper PPE's should only be available at site (one maintenance staff was found at location without mask).
4. Punching gate/ turnstile gate were not made free for easy exit of workforce (in & out gate were opened).
5. Suggestion – There should be proper approach at main gate entrance for easy mobilization/ movement of emergency vehicle.

To,
Regional Officer
Regional Office,
Gujarat Pollution Control Board (East – Kutch),
Sector No. 8, Gandhidham,
Kutch – 370201.

Subject: Submission of compliance to observation/suggestion/instruction made by GPCB officials during inspection.

Reference: GPCB Inspection letter dated 20.11.2018, PCB ID: 17739 (**Annexure – 1**)

Dear Sir,

With reference to the above mentioned subject, APSEZL is submitting the compliance details of your observations as below:

- ✓ **Our Reply against your Observation – 1**: Approx. 200 KL (60 KL/Day) of wastewater will be generated due to washing of 01 tank as & when waste oil storage will be stored within the liquid terminal premises. Entire quantity of wastewater generated from tank washing due to storage / handling of waste oil will be sent to Effluent treatment plant for further treatment. Treated water will be utilized for horticulture purpose within the APSEZ premises.

  We have provided dedicated liquid cargo storage tank within our tank farm, however occasionally it is required to wash the tank to changeover the cargo in case of non-availability of dedicated tank. As per our present CC&A granted, maximum effluent generation quantity @ 90.31 KLD due to tank washing activity is provided. Adequate effluent treatment plant of 120 KLD capacities to treat and handle the total effluent load is in operation.

  Washing of these tanks might be few times in a year due to waste oil handling activity. So whatever quantity of wastewater generated due to this washing activity will be well within the GPCB consented limit.

- ✓ **Our Reply against your Observation – 2**: We will dispose entire quantity of waste oil to the GPCB / CPCB registered recyclers / reprocessors. Details of CPCB / GPCB registered recyclers / reprocessors are attached as **Annexure – 2**.

- ✓ **Our Reply against your Observation – 3**: Till date we have not received any waste oil from ships / vessels, however as per current CC&A , permission to receive and handle slop & its further treatment in oil water separator (25 m3/hr) is available.

LEGAL UNDERTAKING

I, Sumit Paliwal age 44 years, Sr. Manager – Environment Cell, Adani Ports and Special Economic Zone Limited at Plot No. 169/P, Navinal Island, Mundra, Ta: Mundra, Dist: Kutch do hereby undertake as under:

APSEZL has applied for CC&A-Amendment for handling, storage and disposal of Waste Oil (Slop Oil, Used Oil, Oil Tank Cleaning Water, Oily Water, etc.) from Ships / Vessels @ 0.18 MMTPA capacities.

Waste Oil will be handled, stored and disposed as per the provision of Hazardous & Other Solid Waste (Management & Transboundary) Rules 2016.

Due to proposed activity, there will be no increase in water consumption as well as wastewater generation and it will be well within the GPCB consented limit.

That is stated herein above is true to the best of my knowledge and the same I believe to be true.

Signed / Sworn
Before Me.

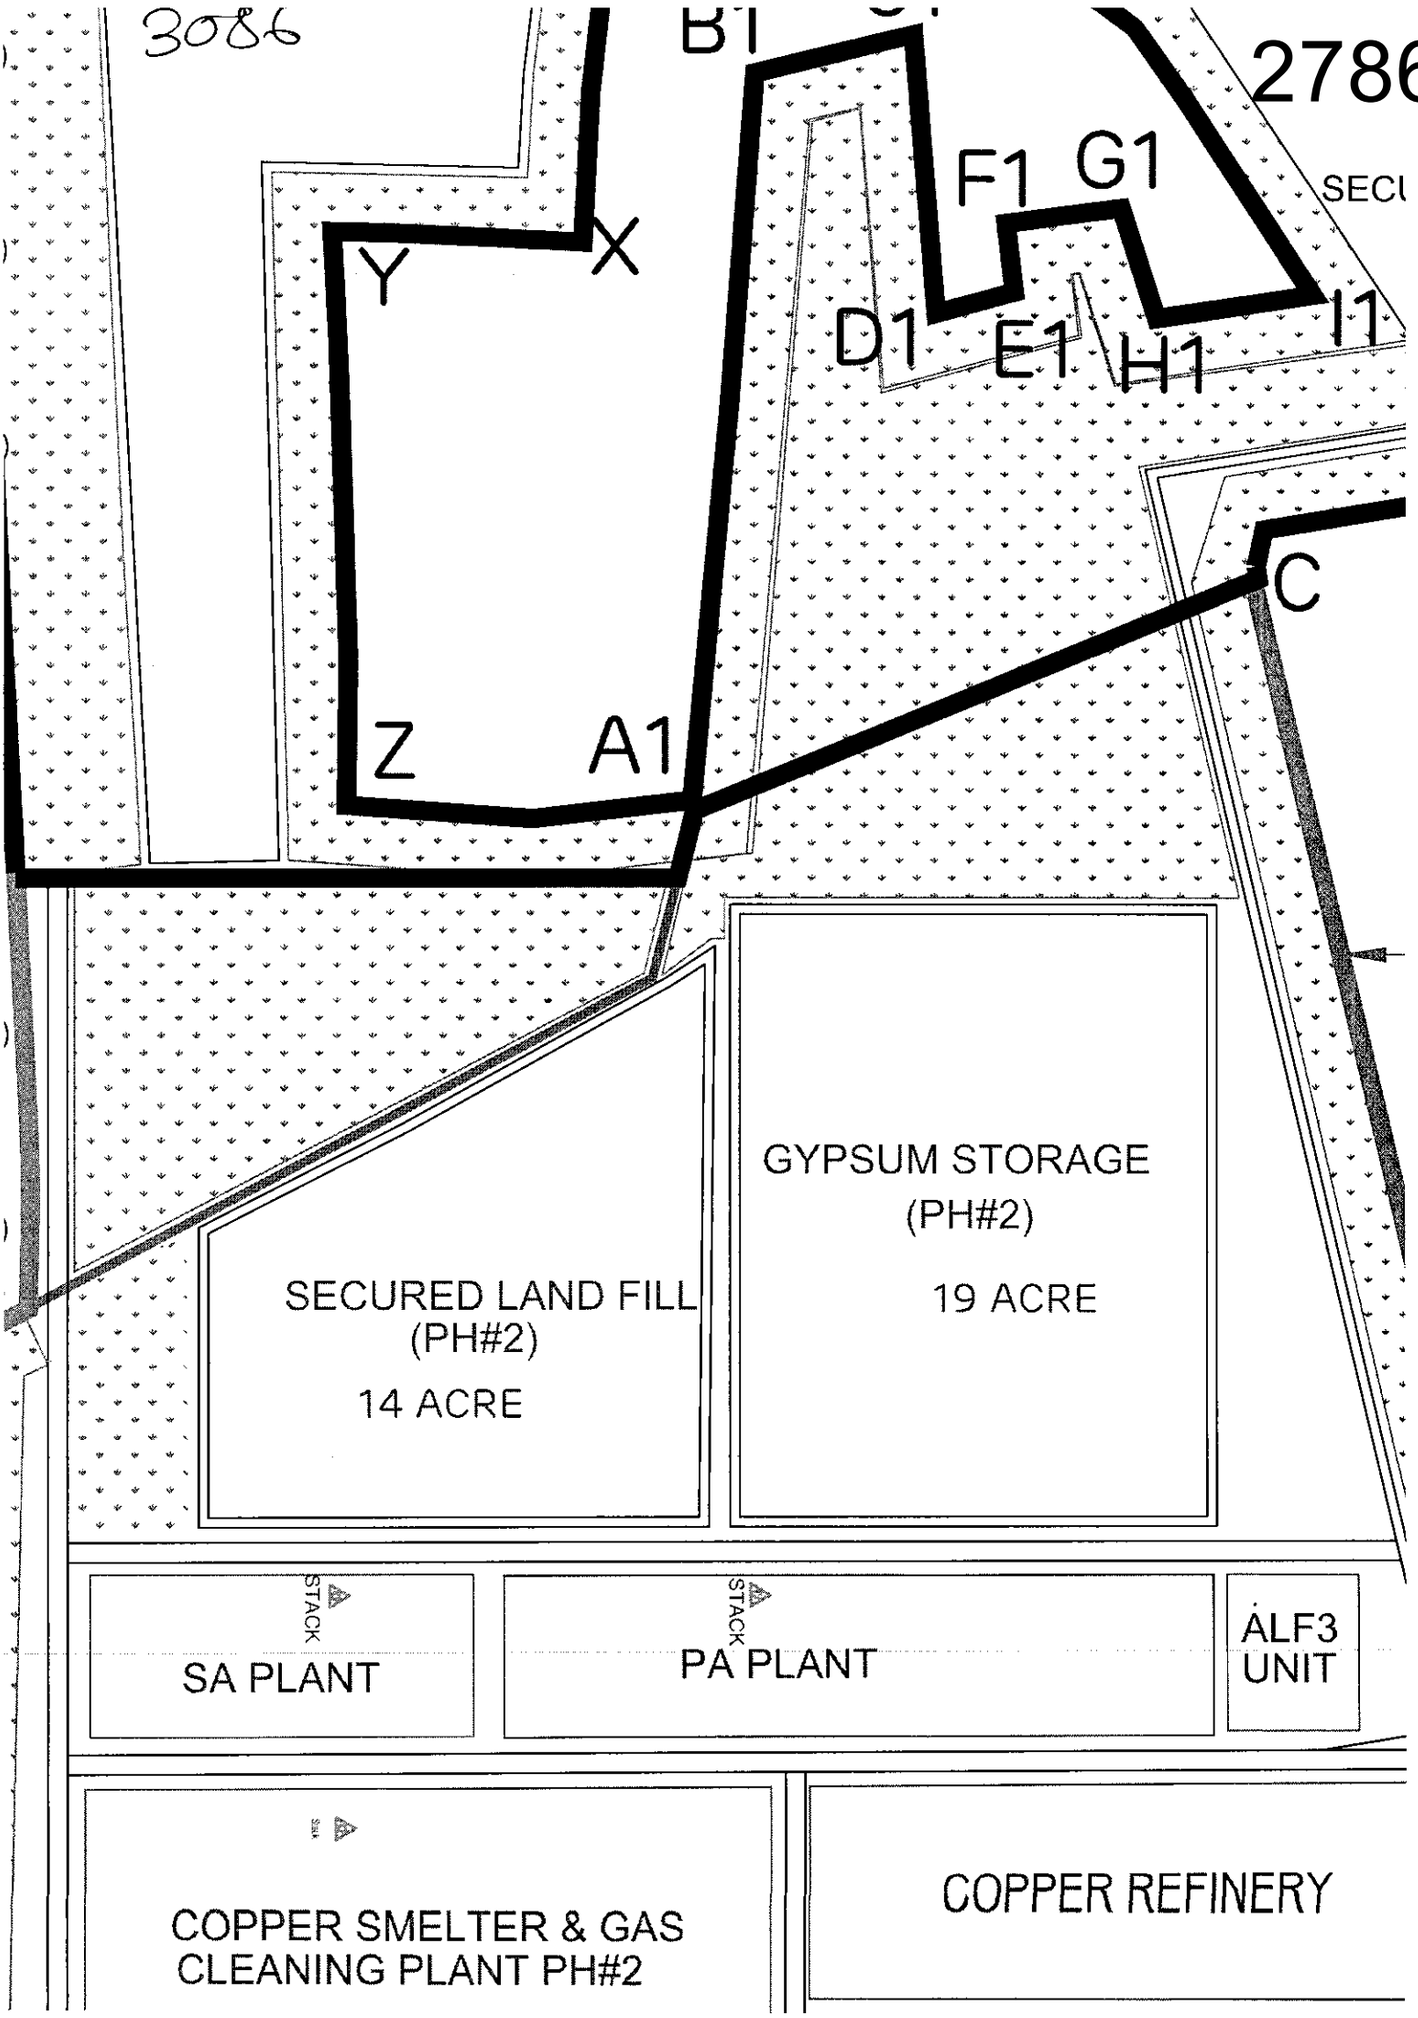
EAC OBSERVATION:

The reply to TOR point No (4) is not proper.



REPLY:

Description	Compliance
i) Location of the project site covering village, Taluka/Tehsil, District and State, Justification for selecting the site, whether other sites were considered.	Complied. EIA Chapter-2, Section 2.1.2, Page C2-3
ii) A Topo- sheet of the study area of radius of 10 km and site location on 1:50,000/1:25,000 scale on an A3/A2 sheet. (including all eco-sensitive areas and environmentally sensitive places)	Complied. EIA Chapter-1, Figure 1.2.
iii) Co-ordinates (Lat-long) of all four corners of the site.	Drawing along with all boundary corners is attached as **Annexure-29(a) of ADS Reply.**
iv) Google map-Earth downloaded of the project site.	Complied. EIA Chapter-1, Figure 1.3.
v) Layout maps indicating existing unit as well as proposed unit indicating storage area, plant area, greenbelt area, utilities etc. If located within an Industrial area/Estate/Complex, layout of Industrial Area indicating location of unit within the Industrial area/Estate.	Layout of APSEZ indicating existing industries and proposed copper unit is attached as **Annexure-29(a) of ADS Reply**. Details of the proposed copper refinery unit indicating storage area, plant area, greenbelt area, utilities etc. is attached as **Annexure-29(b) of ADS Reply.**
vi) Photographs of the proposed and existing (if applicable) plant site. If existing, show photographs of plantation/greenbelt, in particular.	Complied. EIA Chapter-1, Figure 1.4(A) and 1.4 (B), pages C1-9 and C1-10.
vii) A list of major industries with name and type within study area (10 km radius) shall be incorporated. Land use details of the study area	Complied. 4620 MW TPP of Adani Power (Mundra)Limited 4000 MW TPP of Coastal Gujarat Power Limited (CGPL). Land use of the study area is provided in Chapter-3, Section-3.3 of EIA Report.
viii) Geological features and Geo-hydrological status of the study area shall be included.	Geo-hydrological study has been conducted and is attached as **Annexure- 18 of ADS Reply.**
ix) Details of Drainage of the project up to 5 km radius of study area. If the site is within 1 km radius of any major river, peak and lean season river discharge as well as flood occurrence frequency based on peak rainfall data of the past 30 years.	Complied.

3085

EAC OBSERVATION NO.-29

Details of Flood Level of the project site and maximum Flood Level of the river shall also be provided. (Mega green field projects).	
x) Status of acquisition of land. If acquisition is not complete, stage of the acquisition process and expected time of complete possession of the land.	Total project area for the proposed Copper Refinery is 256.58 Ha. APSEZ is in possession of 154.19 Ha land and is already notified as SEZ via Gazette Notification of MINISTRY OF COMMERCE AND INDUSTRY dated 21st September 2016. The balance land of 102.39 Ha for proposed Copper Refinery Project is part of Forest Clearance (FC) proposal no- F. No. 8-04/2016-FC for diversion of 1576.81 Ha of forest land applied by M/s APSEZ. This FC proposal has been accorded stage-1 "In-principle" approval vide letter dated 16th November 2018, under Section-2 of the Forest (Conservation) Act, 1980 in favour of APSEZL for the development of Special Economic Zone (SEZ) and Industrial Park. Forest Clearance (FC) Stage-I, dated 16th November 2019.
xi) R&R details in respect of land in line with state Government policy.	No R&R involved in proposed Project.

EAC OBSERVATION:

The data retrieved from the LULC studies shall be utilized for the prediction of impacts and mitigation measures.

REPLY:

Based on the remote sensing satellite imageries data, land use/ land cover maps have been prepared for the 10 km radius study area for analyzing the land use pattern of the study area. IRS Resourcesat-2 of 5 m resolution (L4FMX) multispectral satellite data of 21st January/14th February 2016 was used for the mapping and interpretation. The land use pattern of the study area indicates that 37.41% of the study area is under agricultural land followed by water bodies of about 22.63%. Percentage of built-up area and forest land is about 5.08% and 2.02% respectively. Waste lands and wetlands in about 13.58% and 10.80% of the study area. Reclaimed land, salt pans and sandy area is about 8.48% of study area. The details of land use studies are presented in Section-3.3 of Chapter-3 in the Final EIA Report.

- **Air Quality Impact on Land use/Land cover**

Flash Smelting technology was considered for modelling studies of proposed project. The maximum predicted incremental GLC's for pollutants such as PM_{10} 1.13 µg/m^3, $PM_{2.5}$ 0.4 µg/m^3, SO_2 5.33 µg/m^3, NO_2 0.16 µg/m^3, HF 0.03 µg/m^3 and Hg <0.005 µg/m^3 in 2.2 km in NE direction were determined for FSF technology. However, in the cases, the resultant ambient air quality values are observed to be well within the NAAQS 2009 considering the worst case scenario (representing winter season).

Hence, it can be concluded that there will not have any major adverse impact on surrounding agriculture, forest land, nearest settlements and other type of lands due to the proposed copper refinery plant. Further, the proposed mitigation measures will bring down these concentrations making the activity more environment friendly. The air quality modelling isopleths are superimposed on LULC map for the prediction of impacts and mitigation measures are enclosed **Annexure-31**.

- **Water Quality Impact on Land use/Land cover**

The water system is highly integrated and is designed for Zero Liquid Discharge (ZLD). The total water requirement for the project is about 35,496 KLD (35.5 MLD). 32,267 KLD (32.27 MLD) would be sourced from desalination plant of APSEZ Limited and supply through M/s. Mundra Utility Private Limited (MUPL). Balance will be met from recycled water. No ground water is proposed to abstract for the project usage. However, a ground water level monitoring system shall be established by installing 5 piezometers within the plant premises and monitoring water levels at a monthly interval.

Wastewater in the proposed project will be generated from plant facilities, plant operations, cooling system and landfill areas. Sewage generated from plant domestic facilities will be treated in STP and used for horticulture and plantation,

EAC OBSERVATION NO.-30

toilets etc. Wastewater/ reject water generated from plant operations and landfill will be treated in ETPs and will be recycled for plant operations.

Kotdi creek towards south of project site and Boradi Mata creek towards southeast of project site are the major creeks in the study area. Arabian Sea, the Gulf of Kachchh is in the southern part occupying 18% of the study area. Danesri Nadi, a seasonal stream passes through western part of the project site. Danesri Nadi originates from north of study area (3.80 km from study area) and has a catchment area of 3.75 sq km from railway line near project site. There are no other drainage courses in the project site. Danesri Nadi along the project boundary will not be disturbed and maintained with necessary bank stabilization will be done with compaction/stone pitching and raising the bund up to 2.0 m. The Danesri Nadi conservation plan will include a 50 m corridor from HFL along the stream course for green belt development and another 50 m along the green belt where any storage is coming (total of 100 m from HFL along the stream course near the storage areas) as presented in plant layout hereunder. No effluent will be discharged into this stream from the plant. Storm water from plant operations, storage areas, landfill and other pollution prone areas shall be separated and diverted to ETP for treatment and reused for plantation and other non-potable uses. The quality will be monitored periodically to ensure contaminant free storm water only reaches Danesri Nadi.

Hazardous cake, ETP waste sludge, scrubber cake, spent catalyst and spent resins (from DM, RO & Refinery) will be stabilized and stored in secured land fill of 13.35 ha as per guidelines of MoEF&CC/ CPCB/ GPCB. Further, an area of 18.62 ha and 20.63 ha are identified for the intermediate/emergency storage of copper slag and phosphogypsum. Provision would be made to reclaim the disposed copper slag and phosphogypsum from gypsum pond at a later stage for various utilization ventures. The used oil, oil sludge, nickel sludge and arsenic bearing sludge (As-Cu precipitate) will be given to authorized recycler. The detailed Geology and Hydrogeology report is enclosed as **Annexure-18**.

3090

EAC OBSERVATION- 31

EAC OBSERVATION:

The Air Quality modelling studies shall be re-worked out including the mercury and keeping the mixing height in view.

REPLY:

Mercury (Hg) in ambient air was monitored during the period of month of January and February 2019 at eight locations within the 10 km radius study area.

For the mercury sampling, IS: 5182-Part-23 has been followed. The collected sample has been extracted by microwave extraction (Method IO-3.1) method. The extract has been analysed by the ICP MS having least count of 5.0 ng/m^3

The Hg content in the ambient air found to be <5.0 ng/m^3 which was monitored during the period of month of January and February 2019. The dispersion modelling using AERMOD requires hourly meteorological data.

RESULTANT GLC's – WORST CASE SCENARIO

Expressed in µg/m^3

Parameter	Baseline Concentrations	Scenario-III Night Time Predicted Concentrations	Resultant GLC's	NAAQS Limit
PM_{10}	84.200	2.450	86.650	100
$PM_{2.5}$	43.900	00.850	44.750	60
SO_2	42.600	11.600	54.200	80
NO_2	32.800	00.340	33.140	80
Hg	00.005	0.006	0.0110	-

The predicted maximum GLC's during night time were observed to on higher side when compared to day time. However, the night time GLC's were found to be within the NAAQ limits.

Site specific data recorded (Sodar Study) at site is used for executing modelling of impact studies. The site specific meteorological data is processed by using AERMET processor.

AVERAGE MIXING HEIGHTS – DURING WINTER SEASON

Day Time		Night Time	
Hours	Mixing Height (m)	Hours	Mixing Height (m)
6:00	400	18:00	200

Considering the mixing height following process stacks height has been revised.

Sr No	Stack Name	Earlier considered Height (m)	Revised Height (m)
	Unit-1		
1	Main Stack Secondary Gas Scrubber- I & II (Bi flue) (Convertor Fugitives and Anode & scrap melting furnace	100	150
2	Electric Furnace and Secondary gases from Smelting – I (Bi Flue)	70	100
3	Phosphoric Acid Plant – I	90	100
	Unit-2		
4	Main Stack Secondary Gas Scrubber- I & II (Bi flue) (Convertor Fugitives and Anode & scrap melting furnace	100	150
5	Electric Furnace and Secondary gases from Smelting – II (Bi Flue)	70	100
6	Phosphoric Acid Plant – II	90	100

PREDICTED INCREMENTAL CONCENTRATION DUE TO VARIATION IN MIXING HEIGHTS WITH FSF TECHNOLOGY

Expressed in µg/m³

Parameter	Earlier Scenario submitted in EIA	Scenario-I 24 Hrs	Scenario-II Day Time	Scenario-III Night Time
PM_{10}	1.32	1.13	0.60	2.45
$PM_{2.5}$	0.54	0.40	0.30	0.85
SO_2	10.37	5.33	5.13	11.60
NO_2	0.23	0.16	0.11	0.34
Hg	-	0.005	0.003	0.006

With increase in stack height and with reduced velocity from 22-25 m/sec to 16-18 m/sec the GLC has reduced. The results of the same is presented above.

The detailed report is provided as **Annexure- 31**

1.0 Impact on Air Quality

The air quality modeling and impacts section has been revised as per the discussions and suggestion given by EAC members during the meeting held on 10th January 2019. Sulphur dioxide (SO_2) and Particulate Matter (PM) emissions and NO_2 emissions are the main pollutants in the copper refinery plant. Further, air dispersion modeling studies were carried out for mercury. The incremental Ground Level Concentration's (GLC's) due to the proposed copper refinery have been predicted by using air dispersion modeling.

➢ ***Details of Mathematical Modelling***

For prediction of maximum Ground Level Concentrations (GLC's), the air dispersion modeling software (AERMOD version 7.1.0) was used. AERMOD is steady state advanced Gaussian plume model that simulates air quality and deposition fields up to 50 km radius. AERMOD is approved by USEPA and is widely used software. It is an advanced version of Industrial Source Complex (ISCST3) model, utilizes similar input and output structure to ISCST3 sharing many of the same features, as well as offering additional features. The model is applicable to rural and urban areas, flat and complex terrain, surface and elevated releases and multiple sources including point, area, flare, line and volume sources. Dispersion modeling using AERMOD requires hourly meteorological data. Site specific data recorded at site is used for executing modeling studies. The site specific meteorological data is processed by using AERMET processor.

➢ ***Model Set-up***

The model set-up details are presented in **Table-1** below:

TABLE-1
MODEL SET-UP

Sr. No.	Parameter	Details
1	Model Name	AERMOD (Version 7.1.0)
2	Model Type	Steady state Gaussian Plume Air Dispersion model
3	Topography	Rural, Flat
4	Averaging Time	24 hours
5	Source Type	Point Source
6	Boundary Limits	10 km X 10 km
7	Co-ordinate System	Uniform Cartesian Grid
8	Receptor Height	0
9	Anemometer	10 m
10	Surface meteorological data	Site Specific data processed by AERMET
11	Upper air Data	Site specific data using AERMET processor

- ***Model Input Data***

✓ **Atmospheric Inversion Level and Mixing Height Study**

The atmospheric inversion studies were carried out at the project site for estimating the site specific mixing heights based on variable weather conditions. Same has been used in modeling in order to have realistic concentration. The upper air data have

been generated at site was used for winter season, which represents worst case scenario. The mixing heights observed during the study period are given below in **Table-2** and the diurnal variation of ABL mixing height are shown in **Figure-1**.

TABLE-2
AVERAGE MIXING HEIGHTS – DURING WINTER SEASON

Day Time		Night Time	
Hours	**Mixing Height (m)**	**Hours**	**Mixing Height (m)**
6:00	400	18:00	200
7:00	400	19:00	100

12:00	800	00:00	100
13:00	800	01:00	100
14:00	1000	02:00	200
15:00	800	03:00	220
16:00	600	04:00	250
17:00	400	05:00	300

Source: Site Specific Sodar Studies

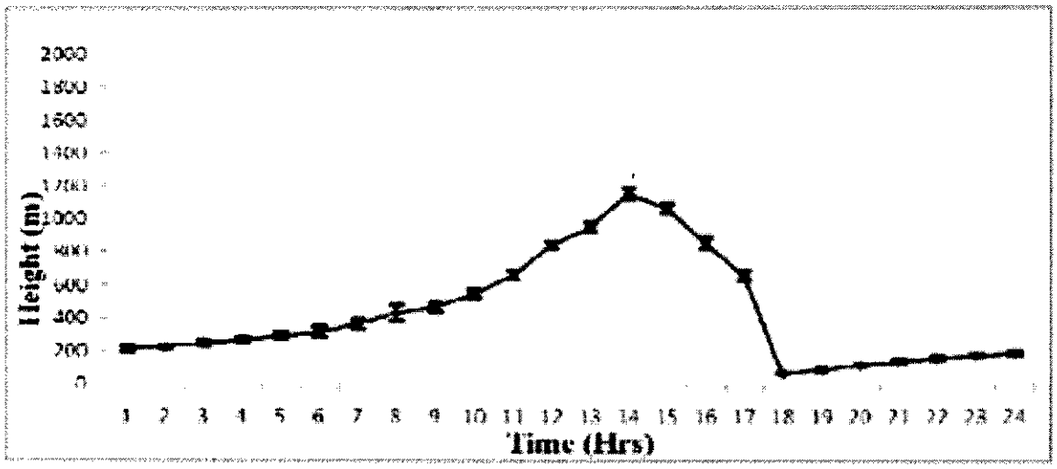

FIGURE-1
DIURNAL VARIATION OF ABL MIXING HEIGHT AT PROJECT SITE

From the studies, the maximum of inversion height is observed during noon hours (1200-1400 hours) when the ground temperature is also maximum and minimum during night time periods of maximum ground cooling (18:00 - 20:00 hours). These observations support the concept of sea breeze and land breeze conditions prevailing at the project site.

✓ **Stack Details**

The stack details have been revised based on the discussions held during the EAC meeting. The main stack secondary gas scrubber I & II and main sulphuric acid plant stack have been increased from 100 m to 150 m. Similarly, stack connected to electric furnace & secondary gases from smelting-I have been increased from 70 m to 100 m.

Similarly, stacks connected to sulphuric acid plant pre-heater-I & II, slag granulation-I and dust extraction-I (rock phosphate area) have been increased from 30 m to 45 m each. The details of stack emissions of proposed copper refinery project are given in **Table-3.**

3095

***denotes stacks not considered for modelling*

The simulations have been carried out to evaluate PM, SO_2 and NO_2 likely to be contributed by the proposed copper refinery. Further, pollutants such as hydrogen fluoride and mercury were also considered for air dispersion modelling studies. The Ground Level Concentrations (GLC's) were predicted within 10 km radius covering 16 directions.

FSF technology was considered for modelling studies. The maximum predicted GLC's for pollutants such as PM_{10}, $PM_{2.5}$, SO_2, NO_2 and Hg were determined for FSF technology and presented in **Table-4.** In order to find out the maximum GLC's on various land uses, the predicted concentrations (Isopleths) were overlaid on the topo map and presented in **Figure-1** to **Figure-4** respectively.

TABLE-4
PREDICTED SHORT-TERM MODELLING RESULTS (24 HOURLY) WITH FSF TECHNOLOGY

Pollutants	Maximum Incremental Levels (µg/m³)	Distance (km)	Direction
Particulate Matter (PM_{10})	1.13	2.2	NE
Particulate Matter ($PM_{2.5}$)	0.40	2.2	NE
Sulphur dioxide	5.33	2.2	NE
Nitrogen dioxide	0.16	2.2	NE
Hydrogen fluoride	0.03	2.2	NE
Mercury (Hg)	0.005	2.2	NE

- ***Resultant Concentrations after Implementation of Project***

The resultant concentrations after the implementation of the proposed project are given in **Table-5.**

TABLE-5
RESULTANT CUMULATIVE GROUND LEVEL CONCENTRATIONS (24 HOURLY) WITH FSF TECHNOLOGY

Pollutant	Concentrations (µg/m³)			
	Baseline	Incremental Concentration	Resultant Cumulative Concentration	NAAQS Limits
PM_{10}	84.2	1.13	85.33	100
$PM_{2.5}$	43.9	0.40	44.30	60
SO_2	42.6	5.33	47.93	80
NO_2	32.8	0.16	32.96	80

Observations:

The predicted maximum GLC's of FSL technology. However, in the cases, the resultant ambient air quality is observed to be well within the NAAQS 2009 considering the worst case scenario (representing winter season).

Hence, it can be concluded that there will not have any major adverse impact on surroundings due to the proposed copper refinery plant. Further, the proposed mitigation measures will bring down these concentrations making the activity more environment friendly.

Mixing Height and Concentration of Air Pollutants:

Sodar studies of inversion / mixing height have been undertaken by Vimta Labs Ltd. for the project site at located at project site, district Kutch, Gujarat (India). Study is undertaken for air quality modeling for the proposed copper project.

The continuous Sodar data recorded during the study period (winter season) has been utilized to evaluate hourly averaged mixing /inversion height and presented in this report.

The maximum mixing height is the height of the convective layer associated with the maximum surface temperature. The maximum mixing height exhibits both local and seasonal variations. In addition it is affected significantly by topography and large scale air movements. Maximum values of mixing heights will be observed in day time. Minimum values of mixing height will be observed in the late hours of the night or in the early morning hours and may be the result of a surface based inversion. The pollutants which released into the air from any source of pollution are being continually mixed. On hot days, they are taken up extremely high away from the ground. In contrast to that, in cool days, the mixing height is very low and pollutants remain close to the ground.

The maximum mixing height is 1000 m occurring at 14:00 hours. The convective mixing led to the decrease in concentration of the air pollutants around noon. Similarly, the minimum mixing height is 100 m occurring between 18:00-20:00 hours. Accordingly, the air pollutants are expected to exhibit variations during day and night time.

Modelling simulation were carried out considering 3 scenarios considering 24 hours mixing heights, day time and night time mixing heights. The predicted Ground Level Concentration's (GLC's) for 3 scenarios are presented in Table-6 and Table-6.

Scenario-I: Modeling considering 24 hours Mixing Height- (0.00 Hrs to 23:59 Hrs)
Scenario-II: Modeling considering Day Time Mixing Heights (6:00 AM to 18:00 PM)
Scenario-III: Modeling considering Night Time Mixing Heights (18:01 PM to 5:59 AM)

TABLE-6
PREDICTED INCREMENTAL CONCENTRATION DUE TO VARIATION IN MIXING HEIGHTS WITH FSF TECHNOLOGY

Expressed in $\mu g/m^3$

Parameter	Scenario-I 24 Hrs	Scenario-II Day Time	Scenario-III Night Time
PM_{10}	1.13	0.60	2.45
$PM_{2.5}$	0.40	0.30	0.85
SO_2	5.33	5.13	11.60
NO_2	0.16	0.11	0.34
Hg	0.005	0.003	0.006

In order to determine resultant GCL's during night time (representing worst case scenario) the reported baseline concentrations were added to the maximum predicted GLC's and the resultant GLC's were presented in the **Table-7** below:

TABLE-7
RESULTANT GLC's – WORST CASE SCENARIO
[FSF TECHNOLOGY]

Expressed in µg/m^3

Parameter	Baseline Concentrations	Scenario-III Night Time Predicted Concentrations	Resultant GLC's	NAAQS Limit
PM_{10}	84.2	2.45	86.65	100
$PM_{2.5}$	43.9	0.85	44.75	60
SO_2	42.6	11.60	54.20	80
NO_2	32.8	0.34	33.14	80

The predicted maximum GLC's during night time were observed to on higher side when compared to day time. However, the night time GLC's were found to be within the NAAQ's.

EAC OBSERVATION NO.- 32

EAC OBSERVATION:

"The Environmental Policy of the Organization is not meeting the requirements given in ToR Point No. 9(i), 9(ii), 9(iii), 9(iv)."

i. **Does the Company have a well laid down Environment Policy approved by its Board of Directors? If so, it may be detailed in the EIA Report.**

REPLY:

Company has a well laid down "Environment. Health & Safety Policy" approved by the Chairman and same is available in Final EIA Report, Volume-II, Annexure-XVI. The same is displayed below.

adani

ENVIRONMENT, HEALTH & SAFETY POLICY

We at Adani, strive to make our businesses sustainable, that benefits our customers, our employees, our shareholders and society in general. We believe that in addition to integrated infrastructure business, there is a bottom line in performing our operations according to prescribed standards, specifications and regulations on governance, which are safe in working and environmental friendly for the well-being of the working community.

As a responsible corporate, we at ADANI have a firm conviction that the industrial injuries, occupational hazards as well as safety and environmental incidents are preventable. We recognize and trust people as our most important asset and have commitment to provide safe and healthy work environment impacting not only those, who are working in our industry but also community, which is living in the vicinity.

To achieve this objective, we shall

a. Develop, implement, maintain and sustain EHS Management System across the Group to set up new benchmarks for the respective sector of operations, which superimpose the regulatory and statutory requirements.

b. Verify, audit and periodically review EHS performance and set new targets to revise these benchmarks.

c. Formulate EHS objectives and targets for continual improvement and to have a periodic review for ensuring that these are in conjunction with the individual business and corporate levels.

d. Conduct all our operational activities in such a manner as to avoid harm to employees, contractors, stakeholders and community at large.

e. Inculcate safety & health as a personal value through behavioral intervention and recognize it across levels with continuous correction of unsafe behavior.

f. Provide adequate training and resources so as to bring awareness and ability to carry out work safely.

g. Emphasize responsibility and accountability to all employees and contractor workforce for safe performance on the job and encourage safe behavior off the job.

h. Evolve ways to reduce or eliminate the use or release of toxic and hazardous material and prevent pollution by conserving natural resources, recovering and recycling the raw materials for safe, healthy and clean environment.

GAUTAM S ADANI

Date: 01.01.2016

ii. Does the Environment Policy prescribe for standard operating process/ procedures to bring into focus any infringement/ deviation/ violation of the environmental or forest norms/ conditions? If so, it may be detailed in the EIA.

REPLY:

Environment. Health & Safety Policy clearly emphasises the purpose and use of standard operating process & procedures in such manner so as to avoid harm to employees, contractors, stakeholders and community at large.

1. To address significant HSEQ risks / impacts - Procedures will be developed and documented to address significant HSEQ risks / impacts and potential deviations. The procedures and / or work instructions will include the required operating criteria. Plant and equipment having a potential to impact HSEQ performance will be maintained to meet design descriptions and specifications. Risks / impacts will be identified, documented, communicated and controlled.

2. Procedures and / or work instructions will be developed, documented, communicated and followed where their absence could cause deviations from required operating criteria or could lead to deviations from the HSEQ policy, objectives, targets or requirements. This includes the implementation of the controls identified for the pre-task risk assessment level, or Job Hazard Analysis (JHA).

3. Plant and equipment - Critical plant & equipment that have a potential to impact HSEQ performance will have a documented procedure for the maintenance, inspection, testing and modification to ensure it meets the design description and specifications.

4. Personnel - The competency of personnel will be verified and documented prior to carrying out procedures with significant HSEQ risk. Competency would be assessed as a result of training, education, experience, behaviour, attitudes and attributes required to effectively perform the role.

5. HSE Committee – HSE Committee will be formed to plan, implement and control the use of standard operating process & procedures in such manner so as to avoid harm to employees, contractors, stakeholders and community at large. Committee also will review periodically the compliance status for the environmental conditions as well as corrective and preventive action required if any.

EAC OBSERVATION NO.- 32

3107

iii. What is the hierarchical system or Administrative order of the company to deal with the environmental issues and for ensuring compliance with the environmental clearance conditions? Details for this system may be given.

REPLY:

The hierarchical system or Administrative order of the company to deal with the environmental issues and for ensuring compliance with the environmental clearance conditions has defined as below

Role, Responsibility & Reporting mechanism is detailed as follows:

Site Environmental Head:

- Developing effective Environment Management System
- To monitor the Environmental Compliance Conditions.
- To monitor the progress of the Environmental Targets set for the year
- To report all the environmental non-compliance as and when it happens to the Location Head.

Location Head:

- Effective implementation of the Environment Management System
- Monthly review of the Environmental Compliance Conditions.
- Monthly review of the progress of the Environmental Targets set for the year
- To report all the environmental non-compliance to the Business CEO within 24 hrs.
- To report any environmental emergencies to the Business CEO on immediate basis

Business CEO:

- Quarterly review of the Environment Management System
- Quarterly review of the Environmental Compliance Conditions.
- Quarterly review of the progress of the Environmental Targets set for the year
- To report all the environmental non-compliance to the Board of Directors on Quarterly Basis.
- To report any environmental emergencies to the board of Directors on immediate basis

iv. Does the company have system of reporting of Non-compliances/ violations of environmental norms to Board of Directors of the Company and/ or shareholders or stakeholders at large? This Reporting mechanism shall be detailed in EIA Report.

REPLY:

Company will have system of reporting of Non-compliances/ violations of environmental norms to Board of Directors of the Company and/ or shareholders or stakeholders at large.
AEL Board has empowered "Risk Management Committee" to manage health, safety & environment risks and achieve compliance with sustainable development responsibilities. A board resolution in this regards is attached as **Annexure 32**

The current scope of Risk Management Committee is as follows:
"The Committee is required to lay down the procedures to inform to the Board about the risk assessment and minimization procedures & the Board shall be responsible for framing, implementing & monitoring the risk management plan of the company."

Additional Scope of Risk Management Committee will be as follows:

"The Committee will also oversee management processes, standards and strategies designed to manage Health, Safety & Environment and Social risks and ensure maintaining the highest standards and compliance with applicable statutory provisions."

The risk management committee will review all the environmental compliance if any on quarterly basis along with its corrective and preventive measures. This will be the permanent agenda point for all board meetings.

Annexure-32

adani

3109

CERTIFIED TRUE COPY OF THE RESOLUTION PASSED AT THE MEETING OF THE BOARD OF DIRECTORS ("BOARD") OF ADANI ENTERPRISES LIMITED ("COMPANY") HELD ON 29TH MAY, 2019.

"RESOLVED THAT in continuation to the earlier resolution passed by the Board of Directors, existing terms of reference of Risk Management Committee be modified and substituted as under:

1. To review the Company's risk governance structure, risk assessment and minimisation procedures and the guidelines, strategies and policies for risk mitigation on short term as well as long term basis.

2. To monitor and review the risk management plan of the Company.

3. To review the current and expected risk exposures of the organization, to ensure the same are identified, qualitatively and quantitatively evaluated, analysed and appropriately managed;

4. Carry out any other function as is referred by the Board from time to time or enforced by any statutory notification / amendment or modification as may be applicable.

5. To review cyber security function of the Company.

6. To oversee management processes, standards and strategies designed to manage Health, Safety & Environment and Social risks and ensure maintaining the highest standards and compliance with applicable statutory provisions."

EAC OBSERVATION NO.-33

EAC OBSERVATION:

The CER shall be calculated on the slab rates as per the Office Memorandum issued on 1st May, 2018.

REPLY:

CER budget has been revised from Rs. 40 Crores to Rs. 58 Crores in line with the slab rate as per Office Memorandum (OM) of MoEF&CC dated 1st May, 2018.

For the proposed Copper refinery project, AEL has envisaged the following key areas for intervention as CER. 311

Sr. No.	Key Area Identified for intervention through CSR activities by proposed Copper Smelter Plant	Activities covered in CER Office memorandum dated 01st May 2018 of MoEF&CC	Proposed Expenditure in Project construction phase (Rs.)					Total Proposed Expenditure (Rs.)
			1st Year	2nd Year	3rd year	4th Year	5th Year	
A.	**Education Initiatives**	Education, skill development	1,50,00,000	1,64,50,000	1,79,49,000	1,45,00,430	1,53,57,960	7,92,57,390
B.	**Community Health Initiatives**	Health, Solid waste Management Facility,	2,60,00,000	3,44,20,000	3,88,69,400	1,13,50,258	1,18,64,776	12,25,04,434
C.	**Sustainable livelihood and Women Empowerment**	Skill Development, Scientific support and awareness to local farmers, Rain water harvesting, Avenue Plantation and plantations in communities area	9,32,00,000	5,41,24,000	4,51,12,680	4,61,70,568	3,73,02,507	27,59,09,755

ANNEXURE - R5

Ministry of Environment, Forest and Climate Change
Impact Assessment Division
(Industry-I Sector)

SUMMARY RECORD OF THE TENTH (10th) MEETING OF RE-CONSTITUTED EXPERT APPRAISAL COMMITTEE HELD DURING 22-23RD AUGUST, 2019 FOR ENVIRONMENTAL APPRAISAL OF INDUSTRY-I SECTOR PROJECTS CONSTITUTED UNDER THE PROVISIONS OF ENVIRONMENTAL IMPACT ASSESSMENT (EIA) NOTIFICATION, 2006.

The tenth meeting of the Re-Constituted Expert Appraisal Committee (EAC) for Industry-1 Sector as per the provisions of the EIA Notification, 2006 for Environmental Appraisal of Industry-1 Sector Projects was held during 22-23rd August, 2019 in the Ministry of Environment, Forest and Climate Change. The list of participants is annexed.

After welcoming the Committee Members, discussion on each of the agenda items was taken up ad-seriatim. The minutes of 9th meeting held during 30-31st July, 2019 were confirmed by the EAC and already uploaded on Parivesh portal.

22nd August, 2019

10.11 Greenfield Copper Refinery Plant (1.0 MTPA) project of **M/s. Adani Enterprises Ltd** located at Adani Ports and Special Economic Zone land in village(s) Siracha and Navinal, Taluka Mundra, District Kutch, **Gujarat** [Proposal No. IA/GJ/IND/86812/2016, MoEF&CC File No. J-11011/113/2016-IA.II(I)] – Reconsideration based on **ADS reply for EC**regarding.

10.11.1 M/s. Adani Enterprises Ltd. has made an online application vide proposal No. IA/GJ/IND/86812/2016dated 6th December, 2016 along with copies of EIA/EMP report and Form – 2 seeking environmental clearance under the provisions of the EIA Notification, 2006 for the project mentioned above. The proposed project activity is listed at Sl. No. 3(a) Metallurgical Industries (Ferrous and Non-ferrous) under Category "A" EIA Notification, 2006 and the proposal is appraised at Central level.

10.11.2 The Greenfield Copper Refinery of 1 (One) Million Tons Per Annum (MTPA) project by M/s Adani Enterprises Limited, proposed at Adani Ports and Special Economic Zone land in village(s) Siracha and Navinal, Taluka Mundra, District Kutch, State Gujarat was initially received in the Ministry on 21stApril 2016 for obtaining Terms of Reference (ToR) as per EIA Notification, 2006. The project was appraised by the Expert Appraisal Committee (Industry) [EAC(I)] during its 6th meeting held on 4thMay 2016and prescribed ToRs to the project for undertaking detailed EIA study for obtaining environmental clearance. Accordingly, the Ministry of Environment, Forest & Climate Change had prescribed ToRs to the project on 21stJune 2016 vide Letter. No. J-11011/113/2016 IA.II (I)

10.11.3 Based on the ToRs prescribed to the project, the project proponent submitted an application for environmental clearance to the Ministry online on 6thDecember 2018 vide Online Application No: SW/83372/2018, Proposal Number: IA/GJ/IND/86812/2016, F. No. J-11011/113/2016 IA.II (I).

10.11.4 The project of M/s. Adani Enterprises Limited located in Villages of Siracha and Navinal, Taluka Mundra, District Kutch, State of Gujarat is for setting up of a new Copper Refinery for production of 1.0 (MTPA) of Copper Cathode. The detail of overall plant configuration as below:

Sr. No.	Plant	Units	Phase-I	Phase-II	Overall Plant Configuration
1	Copper Smelter Plant	TPA	4,50,000	4,50,000	**9,00,000**
2	Copper Refinery Plant	TPA	5,00,000	5,00,000	**10,00,000**
3	Continuous Cast Copper Rod Plant	TPA	2,50,000	2,50,000	**5,00,000**
4	Copper Scrap & E-Scrap Melting Facility	TPA	50,000	50,000	**1,00,000**
5	Sulphuric Acid Plant	TPA	15,00,000	15,00,000	**30,00,000**
6	Phosphoric Acid Plant (100% P_2O_5)	TPA	2,50,000	2,50,000	**5,00,000**

Sr. No.	Plant	Units	Phase-I	Phase-II	Overall Plant Configuration
7	Aluminum Fluoride Plant	TPA	15,000	15,000	**30,000**
8	Oxygen (Industrial) Plant	TPM	48,000	48,000	**96,000**
9	Precious Metal Recovery Plant				
a	Gold	TPA	25	25	**50**
b	Silver	TPA	250	250	**500**
c	Selenium	TPA	144	144	**288**
10	Waste Heat recovery boiler based power plant	MW	20	20	**40**

10.11.5 The proposed capacity for different products for new site area as below:

Sr. No.	Products	Units	Phase-I	Phase-II	Overall Plant Capacity
I	Main Products				
1	Copper Cathode	TPA	5,00,000	5,00,000	10,00,000
2	Sulphuric Acid (> 98%)	TPA	15,00,000	15,00,000	30,00,000
3	Continuous Cast Copper Wire Rod	TPA	2,50,000	2,50,000	5,00,000
4	Gold	TPA	25	25	50
5	Silver	TPA	250	250	500
6	Phosphoric Acid (as 100% P2O5)	TPA	2,50,000	2,50,000	5,00,000
7	Aluminum Fluoride	TPA	15,000	15,000	30,000
II	By-Products				
8	Anode Slime	TPM	250	250	500
9	Selenium	TPM	12	12	24
10	PGM Concentrate	TPM	3	3	6
11	Ferro Sand/ Iron Silicate - Copper Slag (Granulated)	TPM	92,500	92,500	1,85,000
12	Phosphogypsum	TPM	1,04,167	1,04,167	2,08,334
13	Hydro Fluro Silicic Acid (~20% as H2SiF6)	TPM	1,250	1,250	2,500
14	Copper Telluride	TPM	21	21	42
15	Tellurium	TPM	4	4	8
16	Nickel	TPM	8	8	16
17	Bismuth Bisulphate	TPM	60	60	120
18	Calomel (Mercury Chloride)	TPM	9	9	18
19	Mercury	TPM	8	8	16
20	CCR Mill Scale	TPM	25	25	50

10.11.6 The total land required for the project is 256.58 ha, out of which there is no agricultural land and grazing land. 102.39 ha forest land applied for diversion by APSEZ and 154.19 ha is non-forest land already notified as SEZ. The non-forest land

has been acquired by APSEZ and in-principle approval for diversion of forest land has been obtained by APSEZ and committed to provide this land for the project. The Dhaneswari (Dhenderi) River passes through the project area which will be suitably trained and maintained.

10.11.7 The topography of the area is flat and slightly undulating and ranges between 22°48'13.26"N to 22°50'01.88"N Latitude and 69°33'34.74"E to 69°35'08.42"E Longitude in Survey of India topo sheet No. F42J9 & 10, at an elevation of 7-10 m AMSL. The ground water table ranges between 2-10 m below the land surface during the post-monsoon season and 2-20 m below the land surface during the pre-monsoon season. The stage of groundwater development in Mundra Taluka is reported to be63.28% and designated as safeareas as per Technical Report Series, Ground Water Brochure of Kutch District by CGWB – 2013. No groundwater is proposed for either construction or operation phase of the project.

10.11.8 No national park/wildlife sanctuary/biosphere reserve/tiger reserve/elephant reserve etc. are reported to be located in the core and buffer zone within the 10 km radius of the project. The area also does not report to form corridor for Schedule-I fauna. Floral species are mainly dominated by *Prosopis juliflora* and Acacia Senegal. The faunal species were categorized as per conservation status of Wildlife Protection Act, 1972 and reveals that peacock is the only Schedule-I species in the study area and the conservation plan with Rs. 40 lakhs tentative budget is proposed in Section 3.9 of EIA Report.

10.11.9 The process of project showing the basic raw material used and the various processes involved to produce the final output, waste generated in process details are given below:

a. Copper Concentrate : Production of Copper, Sulphuric Acid, Gold, Silver and other by products such as Ferro sand (Iron Silicate/ Copper Slag), Selenium, Copper Telluride, Nickel / Nickel Sludge(Nickel Sulphate/ Nickel Carbonate), production of electricity from waste heat recovery system, etc.
b. Rock Phosphate: Production of Phosphoric Acid and by product Hydro Fluro Silicic Acid and Phospho Gypsum.
c. Aluminum Hydrate: Production of Aluminum Flouride
d. Quick Lime: For Effluent Treatment Plant

Following fuel will be used as per process Requirement:

a. LPG/ PNG
b. Furnace Oil
c. High Speed Diesel
d. Met Coke
e. Coal/ Pet Coke

During the manufacturing Process, following waste will be generated, which will be recycled in the process or will be sent to authorised recyclers:

a. Nickel Sulphate Sludge
b. Arsenic Bearing Sludge – As-Cu Precipitate

c. Used Oil
d. Oil Sludge

During the manufacturing Process, following Hazardous waste will be generated and will be stored in Secured Landfill (SLF) designed in accordance with CPCB Guidelines:

a. ETP Waste sludge and Scrubber Waste
b. Spent Catalyst
c. Spent resins from DM, RO & Refinery Plant
d. Salts from Multi Effect Evaporator

10.11.10 The proposed project to adopt pyrosmelting technology and electro refining process to produce copper cathode. The sulphur dioxide generated during the smelting of copper concentrate is converted into sulphuric acid by Double Conversion Double Absorption (DCDA) process. Part of the sulphuric acid is utilized for production of phosphoric acid within the plant.

10.11.11 Plant is designed on Zero Liquid Discharge concept design and hence no process or treated water will be discharged outside the plant. The treated water will be recycled within the process and to address treated water balance a Reverse Osmosis plant with Multi Effect Evaporator will be installed.

10.11.12 Copper Concentrate will be largely imported from various countries across the globe such as Chile, Peru, Brazil, Australia, Africa, Indonesia, etc. and Rock Phosphate is imported from countries like Jordan, Morocco, Australia, etc. Copper Concentrate & Rock Phosphate will be unloaded from the ship and transported to the closed warehouse either by pipe conveyor or through covered trucks.

10.11.13 The principal raw material for the production of copper metal is copper concentrate blend containing about 25-35% copper, 25-34% sulphur, iron 25-35% and 7-10% moisture. Approximately, 3 LTPA copper scrap and electronic scrap is also used as input to proposed copper smelting plant and copper scrap melting facility.

10.11.14 The major steps in copper extraction are as follows:

- Blending of different grades of concentrates;
- Smelting of concentrate in smelting furnace to produce an intermediate copper rich product known as" matte" containing 58 - 63% copper;
- Converting of liquid matte to blister copper (98 - 99% Cu) in Pierce-Smith converter;
- Fire refining of blister copper to produce anode copper (99.5% Cu) in anode furnace and casting of the anodes; and
- Electrolytic refining of anodes to produce copper cathodes (99.99% Cu).

10.11.15 In the process of extraction of copper metal, sulphuric acid is recovered as a byproduct from the off-gases generated from the smelting and converting furnaces. A part of sulphuric acid produced is utilized for phosphoric acid production and rest will be sold in the market based on market requirement. Phosphoric Acid (PA) Plant uses sulphuric acid produced within the plant and imported rock phosphate to produce Phosphoric Acid. Phosphoric Acid is largely used in fertilizer industries to make phosphatic fertilizers. During the process fluorine gases are recovered as hydrofluro silicic acid

(HFSA) through scrubbing system. HFSA is one of the major raw materials for production of Flouride based chemicals. Hydro fluro silicic acid generated from phosphoric acid plant will be partly sold to fluoride based industries and rest will be converted in value added aluminum fluoride. Aluminum Fluoride plant will be using HFSA produced in PA Plant and Aluminum Hydrate to produce Aluminum Fluoride. Aluminum Fluoride is an important material in production of Aluminum Metal. Aluminum fluoride produced will be sold to aluminum manufacturing companies. The precious metal in the form of anode slime is collected during electrolytic refining of copper will be processed to produce gold, silver and Platinum Group of Metals (PGM) concentrate as well as recovery of minor metals such as Tellurium, Bismuth, Nickel, etc). The copper cathode produced from copper refinery will be melted and drawn in the form of copper wire rod on continuous basis from a continuous casting and rolling machine. Copper rod will be of various sizes as per market requirement such as 8 to 32 mm.

10.11.16 The wastewater generated from copper smelter, sulphuric acid plant, copper refinery, Phosphoric Acid Plant and Aluminum Fluoride plant will be treated in state of art effluent treatment facility. Treated effluent will be consumed within the plant operations to maximum extent. A Reverse Osmosis plant with Multi effect evaporator will be installed at the outlet of treated effluent to reuse water internally and reduce water consumption. This will ensure the plant as a Zero Liquid Discharge facility.

10.11.17 The major technological units envisaged for the copper refinery project are as given below:

- Raw material handling system;
- Smelting furnace;
- Pierce smith converter;
- Ferro Sand Cleaning Furnace (FSCF);
- Copper scrap & E-scrap melting system;
- Anode furnace & anode casting wheel;
- Off gas handling;
- Sulphuric acid plant;
- Oxygen plant;
- Copper Refinery Plant;
- Precious metal recovery plant;
- Continuous cast copper wire rod plant;
- Phosphoric acid plant;
- Aluminum fluoride plant; and
- Effluent Treatment Plant (ETP),
- Utilities like Power, Water, Air and Fuel

10.11.18 The targeted production capacity of the proposed project is 1.0 million TPA. The raw material for the plantwould be procured from open market. The raw material transportation will be by pipe conveyor or covered trucks from port to plant.

10.11.19 The water requirement of the project is estimated as approx. 32800 m^3/day of freshwater requirement will be obtained from the desalination plant of Adani Port

Special Economic Zone (APSEZ). 5,418 m^3 /day treated water from ETP & STP will be utilized for plant operation.

10.11.20 The power requirement of the project is estimated as 300 MW, out of which 260 MW will be obtained from the APSEZ through MUPL and 40 MW would be generated from waste heat recovery system.

10.11.21 Baseline Environmental Studies were conducted during post-monsoon and partly winter season i.e. from 1stOctober to 31stDecember, 2016 Ambient air quality monitoring has been carried out at 8 locations during 1st October to 31st December, 2016 and the data submitted indicated: PM_{10} (35.2 to 84.2 $\mu g/m^3$), $PM_{2.5}$ (19.2 to 43.9 $\mu g/m^3$), SO_2 (14.8 to 42.6 $\mu g/m^3$) and NOx (13.1 to 32.8 $\mu g/m^3$). The results of the modeling study indicates that the maximum increase of GLC for the proposed project is 0.52 $\mu g/m^3$ with respect to the $PM_{2.5}$, 1.27 $\mu g/m^3$ with respect to the PM_{10}, 10.37 $\mu g/m^3$ with respect to the SO_2 and 0.23 $\mu g/m^3$ with respect to the NOx.

10.11.22 Ground water quality has been monitored in 8 locations in the study area and analyzed. pH: 7.3 to 7.8, Total Hardness: 125 to 392 mg/l, Chlorides: 282.6 to 978.4 mg/l, Fluoride: 0.9 to 1.5 mg/l. Heavy metals are within the limits. Surface water samples were analyzed from 4 locations. pH: 7.2 to 8.0; DO: 5.6 to 5.9 mg/l and BOD: <3 mg/l. COD from 60 to 80 mg/l.

10.11.23 Noise levels are in the range of 48.5 to56.6 dBA for daytime and 42.3 to 48.8 dBA for nighttime.

10.11.24 It has been reported that there are no people in the core zone of the project. No R&R is involved. It has been envisaged that no families to be rehabilitated,

10.11.25 It has been reported that a total of 225694 tons per annum of waste will be generated due to the project, out of which 9274tonnes per annum will be recycled through authorised recyclers and within the process. Rest will be stored in the secured landfill (SLF). It has been envisaged that an area of 85.79ha will be developed as green belt around the project site to attenuate the noise levels and trap the dust generated due to the project development activities.

10.11.26 ConsenttoEstablish/ConsenttoOperatefromthe Gujarat State Pollution Control Board /Pollution Control Committee will be obtained as per applicable requirements after obtaining the Environmental Clearance.

10.11.27 The Public hearing of the project was held on 29 April 2017atCommunity Premises Centre Samajvadi Opposite Tunda Primary School under the chairmanship of Shri D R Patel (GAS)(Additional District Magistrate and Resident Additional Collector) for production of 1.0 million TPA of setting up of Copper Refinery plant, under the chairmanship of Additional District Magistrate and Resident Additional Collector. The issues raised during public hearing were mainly about Employment, Environmental Protection and Rural infrastructure.

10.11.28 In line with Office Memorandum dated 1stMay 2018 of MoEFCC regarding Corporate Environment Responsibility, an amount of Rs. 5,800/-Lakhs has been earmarked for Corporate Environment Responsibility (CER) and allocated for relevant programmes to address water, environment, education, community health and rural infrastructure issues in the area based on public hearing issues.

10.11.29 The capital cost of the project is Rs.10,000 Crores and the capital cost for environmental protection measures is proposed as Rs. 104400 Lakhs. The annual recurring cost towards the environmental protection measures is proposed as Rs. 500 Lakhs.The detailed CSR plan has been provided in the EMP in its page No. C6-8. The employment generation from the proposed project / expansion is direct employment and about 5000 indirect employment during operation phase.

10.11.30 Greenbelt will be developed in 85.79Ha which is about 33.43% of the total acquired area. Peripheral greenbelt, consisting of at least 3 tiers around plant boundary will be developed as greenbelt and green cover as per CPCB/MoEF&CC, New Delhi guidelines. Local and native species will be planted with a density of 2500 trees per hectare. Total no. of 225000saplings will be planted and nurtured in 85.79hectares.

10.11.31 The proponent has mentioned that there is no court case or violation under EIANotification to the project or related activity.

Observations of the Committee:

10.11.32 The committee observed that in spite of detailed deliberations during EAC (Industry-1) meetingheld during 9th -11th January 2019 and subsequent information sought, same has not been adequately addressed by the project proponent.

10.11.33 The committee desired that all the information asked for should be carefully prepared and submitted by the Project Proponent. In the meantime, a sub-committee of the committee should carry out the site visit as already recommended earlier.

3120

ENVIRONMENTAL IMPACT ASSESSMENT

FOR

THE PROPOSED GREENFIELD COPPER REFINERY PROJECT (1.0 MTPA) AT ADANI PORT SPECIAL ECONOMIC ZONE LAND IN VILLAGES SIRACHA AND NAVINAL, TALUKA MUNDRA, DISTRICT KUTCH, GUJARAT

VOLUME-I
REPLY TO EAC OBSERVATIONS RAISED DURING MEETING HELD 23RD AUGUST 2019

For and on behalf of VIMTA Labs Limited

Approved by : **M. Janardhan**

Signed :

Position : **Head & Vice President (Env)**

Date : 10th January, 2020

The report has been prepared inline with the prescribed TORs issued vide letter No.J-11011/113/2016-IA.II(I) dated 21st June 2016 of Ministry of Environment, Forests and Climate Change, New Delhi.

This report has been prepared by **Vimta Labs Limited** with all reasonable skill, care and diligence within the terms of the contract with the client, incorporating our General Terms and Conditions of Business and taking account of the resources devoted to it by agreement with the client.

TABLE OF CONTENTS

Sr. No.	Committee Observations	Page Nos.
	Volume-I	
1	According to the EIA report, the land requirement for the project is 256.58 Ha. Out of 256.58 Ha, 154.19 Ha is APSEZ area and 102.39 Ha is a Forest land. The land use conversion plan of 154.19 Ha for industrial purpose has not been obtained from the Competent Authority concerned. Further, PP has obtained stage I forest land diversion approval for 1576.81 ha in the name of M/s. Adani Ports and SEZ Limited. The factual agreement between M/s. Adani Enterprises Limited and M/s. Adani Ports and SEZ Limited for the utilization of 102.39 Ha is a Forest land is not clear.	1
	Annexure-1(a) APSEZ Notification	3
	Annexure-1(b) FC Stage	19
	Annexure-1(c) FAC minutes of meeting	24
	Annexure-1(d) MoU between APSEZ and AEL	41
2	CRZ map inter-alia including demarcation of HTL/LTL/CRZ land classification along with super imposition of plant site through competent agencies has not been submitted.	45
3	Source of copper ore concentrate, characteristics, mode of transportation from source to plant site, confirmed ore linkage document has not been submitted.	46
	Annexure-3(a) Copper concentrate market report	48
	Annexure-3(b) MoU of Copper concentrate	60
4	Water consumption of 10 LTPA Copper smelter is 32790 KLD whereas the water requirement for existing 4.5 LTPA copper smelter unit is only 10,000 KLD. Hence, water requirement for the proposed plant has to be reworked out.	64
	Annexure-4(a) Comparison of wet cooling tower and radiator type air cooler	66
	Annexure-4(b) Aurubis AG Environmental Statement 2017	69
	Annexure-4(c) Aurubis AG Environmental Statement 2018	72
5	According to the EIA records, Dhaneshwari river is passing through the project site and the mangrove reserve forest is existing within the project site. Quantification of these mangroves and conservation measures for mangroves and the river stream has not been submitted.	75
	Annexure-5 Wildlife Conservation & Mangrove Conservation Plan	78
6	Storage arrangements made for the raw materials are found to be not adequate. Open storage of raw materials such as coal, limestone etc., shall be avoided.	169
	Annexure-6 preliminary drawing of Raw material storage	170
7	Sulfur balance of the copper smelter unit has not been submitted.	172
8	Copper slag disposal site co-ordinates, concrete mode of utilization, maximum time frame envisaged for the storage at the disposal yard i.e., one month (or) 15 days has not been submitted.	174
	Annexure-8(a) Layout with Coordinates	177
	Annexure-8(b) Utilization of Copper slag by Directive NHAI	178
	Annexure-8(c) Utilization of Copper slag by Directive NHAI	186
	Annexure-8(d) MoU for utilization of copper slag	187
	Annexure-8(e) Bureau of Indian Standards as per IS 383:2016	197
9	Phospo-gypsum disposal site co-ordinates, concrete mode of utilization, maximum time frame envisaged for the storage at the disposal yard i.e., one month (or) 15 days has not been submitted.	218
	Annexure-9(a) Layout with Coordinates	220
	Annexure-9(b) MoU for utilization of Phosphogypsum	221
10	Lining details for Phospo-gypsum disposal yard, leachate collection system envisaged and details of piezo-well installation has not been	225

	made available.	
	Annexure-10(a) Preliminary design report for construction of gypsum storage yard	228
	Annexure-10(b) Piezo well location details	241
11	Secured land fill site co-ordinates, lining details, leachate collection system envisaged and details of piezo-well installation has not been made available.	242
	Annexure-11(a) layout with coordinates and Piezo well location	248
	Annexure-11(b) Preliminary design report for construction of SLF	249
12	Baseline health status of the people living in the study area of the project site has not been collected.	264
	Annexure-12 Baseline health study report by M/s TALEEM Foundation	265
13	Details regarding disposal of arsenic bearing sludge has not been submitted.	309
14	Mercury in ambient air has not been monitored.	312
	Annexure-14 Details of Mercury in ambient air sampling analysis	313
15	Conservation plan prepared for the Schedule-I species is not meeting the requirement of the conservation of the species that are identified. Therefore, the plan shall be revised considering the requirements of the conservation of the species identified and shall be approved by the competent authority concerned.	317
16	Collection of runoff water from the raw material storage area, slag and gypsum storage yard and its treatment has not been submitted.	319
17	Study on installation of rain water harvesting structure based on annual rain fall pattern and details regarding amount of water to be conserved has not made available.	320
18	Impact on hydro geology regime of the project site has not submitted.	322
	Annexure-18 Geology & Hydrogeology report	327
19	Occupational health assessment envisaged for the employees and workers has not been submitted.	401
	Annexure-19 Occupational health hazards assessment & monitoring plan by M/s. ICMR-NIOH	402
20	As per the Public hearing proceedings, it is noted that there are strong oppositions from the stake holders against the installation of copper smelter unit. Consolidated list of point- wise issues raised and response provided along with action plan for implementation has not been submitted.	459
	Annexure-20(a) Details of PH proceedings along with action plan	472
	Annexure-20(b) Details of PH hardcopy representations along with action plan	513
21	The Chapter-5 consists of only listing of alternative technologies. The committee opined that the PP shall select out of alternative technologies available, based on the selection of the technology, the impact prediction shall be made and mitigation measures shall be proposed.	628
	Annexure-21 Drawing of the various mitigation measures	648
22	Quantitative representation of mitigation measures was not presented.	654
23	Revised water balance shall be submitted.	660
	Annexure-23 Water balance diagram	661
24	HIRA shall be prepared for worst case scenario	662
	Annexure-24 HIRA report for worst case scenario	677
	Volume-II	
25	Management of white shall be spelled out	701
26	Material balance shall be revised.	703
27	The involvement of geological expert shall be provided.	708
28	The compliance of specific conditions of the environmental clearance of the SEZ shall be provided.	718
	Annexure-28(a) Environmental Clearance of APSEZ	719

	Annexure-28(b) Certified Compliance report of APSEZ	729
	Annexure-28(C) Submitted Half Yearly compliance report	808
29	The reply to TOR point No. (4) is not proper.	1164
	Annexure-29(a) Proposed Plant layout with coordinates	1166
	Annexure-29(b) APSEZ layout	1167
30	The data retrieved from the LULC studies shall be utilized for the prediction of impacts and mitigation measures.	1168
31	The Air Quality modeling studies shall be re-worked out including the mercury and keeping the mixing height in view.	1172
	Annexure-31 Air quality monitoring report	1174
32	The Environmental Policy of the Organization is not meeting the requirements given in ToR Point No. 9(i), 9(ii), 9(iii), 9(iv).	1200
	Annexure-32 Board Resolution	1204
33	The CER shall be calculated on the slab rates as per the Office memorandum issued on 1st May, 2018.	1205

EAC OBSERVATION:

According to the EIA report, the land requirement for the project is 256.58 ha. Out of 256.58 ha, 154.19 ha is APSEZ area and 102.39 ha is a Forest land. The land use conversion plan of 154.19 ha for industrial purpose has not been obtained from the Competent Authority concerned. Further, PP has obtained stage I forest land diversion approval for 1576.81 ha in the name of M/s. Adani Ports and SEZ Limited. The factual agreement between M/s. Adani Enterprises Limited and M/s. Adani Ports and SEZ Limited (APSEZ) for the utilization of 102.39 ha in a Forest land is not clear.

REPLY:

Total project area for the proposed Copper Refinery is 256.58 ha. APSEZ is in possession of 154.19 ha land and is already notified as SEZ via Gazette Notification of Ministry of Commerce and Industry dated 21st September 2016 and the same is attached as **Annexure-1(a)**.

The balance land of 102.39 ha for proposed Copper Refinery Project is part of Forest Clearance (FC) proposal no F.No.: 8-04/2016-FC for diversion of 1576.81 ha of forest

EAC OBSERVATION NO.-1

3128

land applied by M/s APSEZ. This FC proposal has been accorded stage-1 "In-principle" approval vide letter dated 16th November 2018, under Section-2 of the Forest (Conservation) Act, 1980 in favour of APSEZL for the development of Special Economic Zone (SEZ) and Industrial Park. Forest Clearance (FC) Stage-I, letter dated: 16th November 2019 is attached as **Annexure-1(b).**

The FAC committee recommended Forest land diversion for the proposed land use of 1576.81 ha which includes 125 ha land for the proposed Copper project during the meeting dated 25th January 2018. Minutes of the Meeting is attached as an **Annexure-1(c).**

There is factual agreement through a MoU **(Annexure-1(d))** dated 14th March 2019 between APSEZ and AEL which reads as "APSEZ will make available to AEL 256.58 ha of land on long term lease basis. Out of the total requirement of 256.58 ha land, currently APSEZ is in possession of 154.19 ha of land which can be readily made available for the project. The balance land of 102.39 ha is under forest diversion process and will be handed over to the project once APSEZ receives the possession of the land." The complete details of land parcels are available as part of the MoU.

In this regard, the State Govt. reported that user agency has submitted details pocket wise land use plan as per the FCA, 1980 guideline and is attached in their reply as Annexure-A, as submitted to CCF, Kutch & Nodal Officer. Detailed land use plan is in accordance with their project needs component. User agency has provided detailed land use plan and has given confirmation that diverted forest area for only those land users which are permissible under the guideline of FCA, 1980.

DETAILS OF PROPOSED LAND USE (AS PER FAC MINUTES)

Proposed Land use	Area in ha
Power Plant 1000 MW X 3	59.9
	209.2
Copper Smelter Plant – 1 MT Capacity	**125**
Coal to Polygeneration -10 MT capacity	89.52
CFS & warehousing	81.59
Engineering Cluster	5.21
Mix Industrial cluster viz engineering ware house etc and social infrastructure as per FCA, 1980 guidelines viz schools, hospitals/dispensary, community halls, cooperatives, etc.	41.45
CFS & warehousing	51.46
Commercial Airport with MRO, Storage yards, fuel tankers, terminals etc.	84.98
	112.06
Engineering Cluster with Water front for manufacturing and assembly of Crane, Boilers, Project cargo, port operation equipment, etc and Liquid storage tanks farm.	516.44
	200
Total	**1576.81**

आलोक वर्धन चतुर्वेदी, अपर सचिव

MINISTRY OF COMMERCE AND INDUSTRY

(Department of Commerce)

NOTIFICATION

New Delhi, the 21st September, 2016

S.O. 3029(E).—WHEREAS, the Central Government had notified/de-notified the Special Economic Zone named M/s. Mundra Port and Special Economic Zone Limited at Mundra in the State of Gujarat under the following notifications of the Government of India in the Ministry of Commerce and Industry (Ministry of Commerce), namely:-

(1) S.O. number 1365 (E) dated 27th May, 2009;

(2) S.O. number 583 (E) dated 26th March, 2012;

(3) S.O. number 1443 (E) dated 31st May, 2013;

(4) S.O. number 3379 (E) dated 11th December, 2015;

AND, WHEREAS, the name of the SEZ was changed from M/s. Mundra Port and Special Economic Zone Limited (MPSEZL) to M/s. Adani Ports and Special Economic Zone Limited vide approval letter No. F.1/15/2011-SEZ dated 27th March, 2012;

AND, WHEREAS, the Central Government has decided to consolidate all the Special Economic Zones notified vide S.O. number 1365 (E) dated 27th May, 2009; S.O. number 583 (E) dated 26th March, 2012; S.O. number 1443 (E) dated 31st May, 2013; S.O. number 3379 (E) dated 11th December, 2015 referred in preceding paragraph for administrative convenience and without affecting rights obligations and fiscal benefits of the Developer(s);

NOW, THEREFORE, the Central Government, in exercise of the powers conferred by second proviso to sub-section (1) of section 4 of the Special Economic Zones Act, 2005 (28 of 2005) (hereinafter referred to as the said Act, read with rule 8 of the Special Economic Zones Rules, 2006, and in supersession of the notification number S.O. number 1365 (E) dated 27th May, 2009; S.O. number 583 (E) dated 26th March, 2012; S.O. number 1443 (E) dated 31st May, 2013; S.O. number 3379 (E) dated 11th December, 2015, referred to the first paragraph, except as respects things done or omitted to be done for such supersession, the Central Government on being satisfied that the requirements under sub-section (8) of section 3 of the said Act and other related requirements are fulfilled, hereby consolidates the Special Economic Zones mentioned in the notifications referred to the first paragraph, and re-notifies following areas comprising following survey numbers given in the table below as a Special Economic Zone, namely:

F. No. 8-04/2016-FC
Government of India
Ministry of Environment, Forest and Climate Change
(Forest Conservation Division)
****

Indira Paryavaran Bhawan
Aliganj, Jorbagh Road
New Delhi – 110 003
Dated: 16th November, 2018

To,

The Principal Secretary (Forests),
Department of Forests & Environment,
Government of Gujarat,
Gandhi Nagar.

Sub: Diversion of 1576.81 ha Reserved Forest Land in favour of Adani Ports and Special Economic Zone Ltd. (APSEZL) for the development of Special Economic Zone (SEZ) and Industrial Park at Village – Siracha, Navinal, Dhrub, Mundra, Baroi, Gorasama, Luni, Bhadreshwar, Tehsil Mundra, under Forest Division and District Kutch, Gujarat (Online Proposal No. FP/GJ/IND/17613/2004):- Reg.

Sir,

I am directed to refer to the APCCF (Land Management) and Nodal Officer, (FCA), Govt. of Gujarat letter No. FCA-1014/10-11/14/S.F-66/F dated 21.01.2016 for seeking prior approval of Central Government under Section-2 of the Forest (Conservation) Act, 1980. The proposal has been examined by the Forest Advisory Committee (FAC) constituted by the Central Government under Section-3 of the aforesaid Act.

2. After careful consideration of the proposal of the State Government of Gujarat and on the basis of the recommendations of the Forest Advisory Committee (FAC), the Central Government hereby agrees to accord *"In-principle"* approval under Section-2 of the Forest (Conservation) Act, 1980 for diversion of 1576.81 ha Reserved Forest Land in favour of Adani Ports and Special Economic Zone Ltd. (APSEZL) for the development of Special Economic Zone (SEZ) and Industrial Park at Village – Siracha, Navinal, Dhrub, Mundra, Baroi, Gorasama, Luni, Bhadreshwar, Tehsil Mundra, under Forest Division and District Kutch, Gujarat, subject to the following conditions:-

(i) Legal status of the diverted forest land shall remain unchanged;

(ii) *The entire forest area being diverted, should not be cleared off the vegetation in one go after diversion. The UA may clear vegetation for the purpose of basic/essential infrastructure to be developed in the SEZ. Thereafter, as and when a specific project / industry is to come up in the SEZ, the corresponding area shall be marked on the ground and cleared off vegetation. Till then the remaining areas shall be maintained as green cover. It shall be ensured that the lease agreement is made within six months of such clearing. A detailed land use for the marked area, on which clearing of vegetation is proposed shall be submitted to the Regional Office of MoEF&CC before start of work on the area, for information. The Regional Office of MoEF&CC shall ensure that the user agency carries out the work which is in conformity with the broad land use submitted by it. It shall be ensured that minimum number of trees are cleared. The user agency shall explore the possibility of trees of 10 cm dia at breast height and above, proposed for felling/clearing are translocated to suitable location within or outside the SEZ in consultation with State Forest department;*

3146

(iii) Felling of tress on the forest land being diverted shall be reduced to the bare minimum and the trees should be felled under strict supervision of the State Forest Department;

(iv) *The diverted forest land shall not be proposed to be utilized for Golf Course, Beach Resort, Park or Residential purposes, or any other activity prohibited by FCA 1980, FC Rules and/or guidelines made there under*

(v) *The diverted forest land shall not be used for the construction/expansion of any private Aerodrome. The forest land may be considered, in future on merits, in case of commercial Airport is developed with the approval of DGCA.*

(vi) *The detailed existing land use with maps of all forest land 2008.41 ha (1840ha + 168.41 ha) for which the approval was granted vide letter dated 30.09.2009 and details of complete land use including forest land for the existing private Aerodrome and power plants within the SEZ may be provided for information;*

(vii) *Forest areas proposed within of Mundra survey no. 141/P, Baroi survey no. 207/P, Goversama survey no. 52/P, Luni survey no. 468/P and Bhadreswar survey no. 733/P are having sea front. 100mt shelter belt/green belt in above villages be included in the Master plan of the SEZ, excluding stretches where use of water front is inevitable;*

(viii) *All the conditions as recommended by the Chief Wildlife Warden shall be complied with the User Agency;*

(ix) *The State Government shall clarify whether any non-forest land situated in and around the SEZ but not forming part of the SEZ at present, can be acquired by/allotted to the APSEZ before Stage-II approval;*

(x) *If 683 ha land of GMB or any other non-forest land is allotted for this SEZ, then the equivalent forest land shall be reduced from the forest land diverted/being diverted for the SEZ;*

(xi) *The State Government and the UA shall make effort to include 122 ha of non-forest land in village Jarapara in the SEZ. Accordingly, it is recommended that 122 ha of forest land in Bhadreswar Block shall be maintained as green belt at the cost of UA;*

(xii) *State government will provide details of lease period, terms and conditions on which the forest land is proposed to be diverted in favour of the Use Agency;*

(xiii) *All other conditions imposed in the approval granted for diversion of 2008.41 ha (1840ha + 168.41 ha) forest land on 30.09.2009 shall be complied;*

(xiv) *Only site-specific activities, permissible under the Rules and guidelines framed under the FC Act, shall be taken up in the forest land to be diverted;*

(xv) *The recommendation of the FAC is subject to the condition that in case of conflicts, the provisions of FC Act, 1980, shall prevail over those of SEZ Act 2005;*

(xvi) *All other conditions/recommendations made by FAC on this proposal in its meeting on 25.01.2018, not in conflict with the recommendation of FAC on 20.09.2018 shall remain unchanged.*

(xvii) *The User agency shall identify suitable land for Compensatory Afforestation over double the forest area being diverted. The land shall be mutated in the name of State Forest Department before the Stage-II approval;*

(xviii) *The User Agency shall deposit in the designated account the estimated amount towards compensatory afforestation to be carrying out by the State Forest Department;*

(xix) The Compensatory Afforestation shall be done over double non-forest land (NFL) i.e *3154 ha* to the forest area proposed to be diverted, as per the recommendation of Government of Gujarat, vide its GR No. FCA-1013/11-10/SF-24/F, dt 12.06.2015. The Compensatory Afforestation shall be done within a period of three years with effect from the date of issue of Stage-II clearance and maintained thereafter in accordance with the approved plan in consultation with the State Forest Department at the cost of the User Agency. CA at rate of 1000 saplings per hectares shall be planted over *3154.00* ha.

(31,54,000 plants). If this is not possible to plant these many seedlings in the identified NFL, the balance seedlings will be planted in degraded forest land as per the prescriptions of the Working Plan at the cost of the User agency. In such case CA cost will be revised and duly approved by competent authority and will be deposited online in the Adhoc-CAMPA account of the state concerned;

(xx) The User agency shall identify and mutate in the name of State Forest Department of Government of Gujarat, 3154 ha of suitable non-forest land for CA adjacent to notified Forest for raising Compensatory Afforestation (CA) shall be notified as reserved Forest under Section-4 or Protected Forest under Section-29 of the Indian Forest Act, 1927 or under the relevant Section(s) of the local Forest Act. The Nodal officer must report compliance within a period of 6 month from the date of grant of final approval and send a copy of the notification declaring the non-forest land under Section 4 or Section 29 of the Indian Forest Act, 1927, or under the relevant section of the local Forest Act as the case may be, to this Ministry for information and record;

(xxi) The State Government shall submit a certificate, that site for CA is suitable and free from all encroachments and other encumbrances, under the signature not below the rank of Nodal Officer (FCA) in the State Government;

(xxii) The land identified for the purpose of CA shall be clearly depicted on a Survey of India toposheet of 1:50,000 scale;

(xxiii) *The Compensatory Afforestation land shall be surveyed at the cost of User Agency and the User Agency shall erect pillars and barbed wire fencing or trench under the consultation of CCF, Kutch Circle;*

(xxiv) The User Agency shall deposit the cost of raising and maintaining the compensatory afforestation at the current wage rate in the account of Adhoc-CAMPA of the state concerned through online e-portal only. The scheme may include appropriate provision for anticipated cost increase for works scheduled for subsequent years;

(xxv) The User Agency shall provide additionally 25% of the CA cost towards Soil and Moisture Conservation measures in the proposed CA area as per site requirement and the said amount shall be deposit in the account of Adhoc-CAMPA of the state concerned through online e-portal only;

(xxvi) The User Agency shall deposit, the Net Present Value (NPV) of the forest land being diverted under this proposal, as per the orders of the Hon'ble Supreme Court of India dated 28.03.2008, 24.04.2008 and 09.05.2008 in Writ Petition (Civil) No. 202/1995 and the guidelines issued by this Ministry vide its letter No. 5-3/2007-FC dated 05.02.2009. The requisite funds shall be deposited in the account of Adhoc-CAMPA of the state concerned through online e-portal only;

(xxvii) At the time of payment on the Net Present Value (NPV) at the then prevailing rate, the User Agency shall furnish an undertaking to pay the additional amount of NPV, if so determined, as per the final decision of the Hon'ble Supreme Court of India;

(xxviii) The user agency should ensure that the compensatory levies (CA cost, NPV etc.) are deposited through challan generated online on web portal and deposited in appropriate bank online only. Amount deposited through other modes will not be accepted as compliance of Stage-I clearance;

3148

(xxix) The forest clearance will be for a period co-terminus with the lease period specified in the lease agreement. The State Government will submit the lease agreement documents specified in the lease agreement;

(xxx) The User agency shall obtain the Environment Clearance as per the provisions of the Environment (Protection) Act, 1986, if required;

(xxxi) *Complete compliance of CRZ regulations shall be ensured;*

(xxxii) Layout plan of the proposal shall not be changed without the prior approval of the Central Government;

(xxxiii) The User Agency will abide by the applicable recommendations of the State Government including State Forest/Wildlife Departments;

(xxxiv) State Government shall complete settlement of rights, in terms of the Scheduled Tribes and Other Traditional Forest Dwellers (Recognition of Forest Rights) Act, 2006, if any, on the forest land to be diverted and submit the documentary evidence as prescribed by this Ministry in its letter No. 11-9/1998-FC (pt.) dated 03.08.2009 read with 05.07.2013 in support thereof;

(xxxv) The user agency shall provide alternate fuels (LPG) to the labourers and the staff working at the site so as to avoid any damage and pressure on the nearby forest areas;

(xxxvi) Boundary of the forest land proposed to be diverted shall be demarcated on ground at the project cost, by erecting four feet high reinforced cement concrete pillars, each inscribed with its serial number, forward and back bearing, distance from pillar to pillar and GPS co-ordinates;

(xxxvii) Any other condition that the concerned Regional Office of this Ministry may stipulate, from time to time, in the interest of conservation, protection and development of forests & wildlife;

(xxxviii) The user agency shall submit the annual self-compliance report in respect of the above conditions to the State Government, concerned Regional Office and this Ministry by the end of March of every year regularly; and

(xxxix) The user agency and the State Government shall ensure compliance to provisions of the all Acts, Rules, Regulations, Guidelines, relevant Hon'ble Court Order (s) and National Green Tribunal (NGT) Order(s), if any, pertaining to this project for the time being in force, as applicable to the project.

3. After receipt of the report on compliance to the conditions stipulated in the paragraph-2 above, from the State Government of Gujarat, Final/Stage-II approval for diversion of the proposed forest land under Section-2 of the Forest (Conservation) Act, 1980 will be issued by this Ministry. Diversion of the proposed forest land to the user agency shall not be effected by the State Government of Gujarat, till Final/Stage-II approval is issued by this Ministry.

Yours faithfully,

16/11/2018

ANNEXURE-1(c)

3156

d) 25% of CA cost will be deposited extra by the user agency for soil and moisture conservation (SMC) activities on the CA land.
e) Complete compliance of FRA will be done and certificate on prescribed form will be submitted along with the compliance report.

Agenda No. 3

F. No. 8-04/2016-FC

Sub: Diversion of 1576.81 ha of Reserved forest land for the development of Special Economic Zone and Industrial Park at Village - Siracha, Navinal, Dhrub, Mundra, Baroi, Gorasama, Luni, Bhadreshwar, Ta. Mundra, Dist. Kutch in favour of Adnai Group, Mundra Port and Special Economic Zone Ltd., Ahmedabad.

The above stated agenda item was considered by FAC on 25.1.18 and details available on file were also considered and the FAC observed as follows

1. The present proposal is for diversion of **1576.81 ha** of reserved forest for non-forestry purpose for the development of port based multipurpose SEZ by Adani Ports and Special Economic Zone Limited (APSEZL) in Mundra coast in Kutch district of Gujarat.

2. Adani Ports and Special Economic Zone Limited (APSEZ) is a private multi-port operator. The company was earlier known as Mundra Port & Special Economic Zone Ltd (MPSEZ) and it changed its name to "Adani Ports and Special Economic Zone Limited (APSEZL)" on January 6, 2012.

3. **Adani Ports and Special Economic Zone Limited (APSEZL):** In 1994, the Gujarat Maritime Board (GMB) approved setting up a captive jetty at the Port of Mundra. The Adani group initiated its activities in Mundra in 1994-95. In 1998, a joint sector company, the Gujarat Adani Port Ltd. (GAPL), was incorporated. In 2001, the Port of Mundra signed a concession agreement with GMB for development, operation, and maintenance of the port at Mundra.
4. According to the State Government, the Ministry of Commerce and Industry, Government of India granted in principle permission for total 10000 ha of Mudra Special Economic Zone (MSEZ) in 2001 under State Government's Exim Policy 2000. Under SEZ Act 2005 a Special Economic Zone (SEZ) at Mundra was notified in 2006. The Mundra Special Economic Zone was merged with GAPL of Adani Group. The combined company was renamed 'Mundra Port and Special Economic Zone Limited (MPSEZL)' under Adani Group.

5. **Forest Clearances granted to MPSEZL:**

   a. On 26th June 1998 the proposal for 2400 ha of Forest land for M/s Adani Chemicals was submitted by the State Government which was rejected by Forest Advisory

Committee (FAC) on the ground that the area contains 19.42 lakh mangrove trees. On 17th July 2002, FAC asked for a fresh proposal to be submitted due to high impacts of the project and its location in an ecologically fragile region. On 26th September 2002 FAC recommends 1840 ha of forest land out of the revised proposal for 1850 ha. 10 ha of interspersed mangrove forests was kept out. However, the proposal was granted in principle approval on 13th May 2004 by MoEF to M/s Adani Chemicals for diversion of **168.41 ha** of forest land in only one consolidated patch in survey area number 169/36 for salt washery and desalination plant for diversion of **1840 ha** of forestland for high purity salt works. The EC was also granted to Adani Chemicals Limited for the establishment of high purity salt works, involving an area of **2946.22 ha**, of this **1850 ha** is forestland, for which the in-principle forest clearance was granted in May 2004. The Forest Clearance (FC) and EC letters specify that 10 ha of interspersed mangrove forest, which was deleted from the proposed area shall be transferred back to the state government and maintained at the project cost.

b. On 23rd June 2004 MoEF granted approval for change of user agency from M/s Adani Chemicals Ltd to M/s Mundra SEZ Ltd. However on 5th September 2007, the MPSEZ Ltd requested the MoEF to amend the 'In principle approval' to include phasing out of payments for the diversions of the forest land and changing the name to Mundra Port and SEZ Ltd (MPSEZL); and also for change of land use in Master Plan also in favour of MPSEZ Ltd.

c. However on 27th March 2008 FAC rejected the change of land use to carry out activities related to the Master Plan of the MPSEZL which was against purposes (high purity salt works and salt washery) for which the forest land was earlier diverted. The FAC noted, *"the proposed land use completely changes the scope and purpose of the original diversion accorded....the state government may be advised to submit the proposal afresh."*

d. The application for fresh forest clearance for 1840 ha came up before the Forest Advisory Committee (FAC) of the MoEF in March 2008. Thereafter on 17th April 2008, the FAC considers and recommended the proposal following a representation by MPSEZL dated 3rd April 2008. This came under the scanner of CEC. On 16th July 2008 Central Empowered Committee reported on the FAC reconsideration decision to divert 1840 ha + 168.41 ha of forest land. The report concludes, *"the CEC is of the view that the recommendations of the FAC in the present case may not be accepted and the present request by the user agency for the diversion of forest land in a phased manner as part of the expansion of the Mundra Port and SEZ Limited may be rejected."* On 3rd October 2008 Supreme Court's order in the TN Godavarman case, *"as Regards the proposed land use, the State Government may furnish a fresh proposal to the FAC within a reasonable time."*

e. A fresh application was made by MPSEZL and was granted in-principle approval for forest land of 2008.41 ha (1840 ha + 168.41 ha) on 27.2.2009. The final approval was granted by MoEF on 30.09.2009 with specific and standard conditions.

3.152

f. The proposed land use for **diversion of 1840 ha** of forest land as recommended by the State Government was as under:

S. No.	Description of Items	Area (Ha)
1.	Port incl. Jetties, Basine, harbour, barge Berths, Tug Berths and their Immediate back-up Areas for Cargo handling area, Crane movement area, circulation areas etc.	386.40
2.	Container Freight Stations (CFS) including closed areas, Open Container Storage areas,	257.60
3.	Godowns & Closed Storage Areas for Bulk & Liquid Cargos including Rail sidings etc.	349.60
4.	Open Stock Yards & Open Hard Stands incl. rail sidings etc. for coal, Iron Ore, Steel, Cement, FIM, Pipes etc.	423.20
5.	Transport & Utiliti Corridor including Railway Lines, Roads, Drains, water Pipelines, Oil & Gas Pipelines, Sewage Pipelines, Sea-Water Intake Channel, Outlet Channel/Pipelines, Transmission Lines, Conveyors, Telecom / Data Transmission Lines, Buildings etc.	368.00
6.	Green Belt, etc.	55.20
	Total	**1840.00**

And the proposed land use for **diversion of 168.41 ha** of forest land as recommended by the State Government was as under:

S. No.	Description of Items	Area (Ha)
1.	Container Freight Stations (CFS) including Closed areas, Open Storage areas, Circulation areas etc.	21.89
2.	Light / Medium Industries	106.10
3.	CBD / Offices, Roads, Drains, Water Pipelines, Oil & Gas Pipelines, Sewage Pipelines, electricity Lines, Telecom / Data Transmission Lines, other Buildings etc.	25.56

4.	Green Belt Development	14.85
	Total	**168.41**

6. The final approval was granted by MoEF on 30.09.2009 with specific and standard conditions..

7. **Details of notified Adani Port Special Economic Zone:** According to the project authority, the project involves development of SEZ of the 10000 ha of SEZ, the plot area, **8481.2784 ha** is notified in different point of time. On May 27, 2009, the Ministry of Commerce and Industry re-notified and consolidated the SEZ area of **6472.8684 ha**. After forest clearance, the Ministry of Commerce and Industry de-notified **1840 ha** of Mundra SEZ on 25th November 2009. The details of SEZ notification is as under:

Notification of SEZ	Area Notified as SEZ (ha)
March 4, 2006, GPCB issued a site clearance certificate to Mundra SEZ Limited for airstrip development at survey No. 52/53 of Village Goersana in Mundra.	
June 23, 2006, Ministry of Commerce and Industry notified multi product SEZ under GAPL of 2406.7592 ha in Mundra and Anjar*talukas*.	2406.759
September 6, 2006, Ministry of Commerce and Industry transferred the notified multi product SEZ under GAPL of 2406.7592 ha in Mundra and Anjar*talukas* to M/s Mundra Port and Special Economic Zone Limited.	
May 10, 2007, Ministry of Commerce and Industry notified power SEZ under Adani Power Private Limited of 293.881 ha in Tunda and Siracha villages.	293.881
July 3, 2007, Ministry of Commerce and Industry notified an additional area of 251.4308 ha was notified as part of the SEZ.	251.4308
June 23, 2006, Ministry of Commerce and Industry notified an additional area of 74.6145 ha as part of the multi product SEZ under MPSEZL.	74.6145
May 2, 2008, Ministry of Commerce and Industry notified an additional area of 1074.1755 ha under the multi product SEZ in favor of MPSEZL.	1074.1755
August 11, 2008, Ministry of Commerce and Industry notified an additional area of 2113.7962 ha under the multi product SEZ in favor of MPSEZL.	2113.7962
Total	6214.657

3154

May 27, 2009, Ministry of Commerce and Industry re-notified and consolidated the SEZ area of 6472.8684 ha.	**6472.8684**

8. The APSEZL again proposed in 2010 to develop another 3510.06 ha including 1840 ha already diverted and another 1670 ha of government land including 864.1299 ha of forest land. APSEZL however approached the Forest Department vide ref no APSEZL/APCCF (land)/F-01/2013-14 dated 10th June 2013 for the entire 1576.81 ha Reserved forest.

9. The State Government of Gujarat vide their letter No. FCA-1014/10-11/14/S.F-66/F dated 21.01.2016 had submitted the proposal for additional **1576.81 ha** of all remaining forest land to consolidate all land holding in the proposed APSEZ which was submitted for diversion in 2005. The proposal was considered earlier in the FAC meeting dated 20.07.2017 also. The details of forest land is as under:

Village	**Survey No.**	**Hect.**
Siracha	295/paiki	125.00
Siracha	295/paiki-2	269.10
Navinal	223/paiki	89.52
Dhurb	169/paiki	81.59
Mundra	141/paiki-2	46.66
Baroi	207/paiki	136.43
Goarsama	52/paiki	112.06
Luni	468/paiki-2	516.45
Bhadreshwar	733/paiki	200.00
		1576.81

10. The application was submitted by Mundra Special Economic Zone Limited (MSEZL) in old application form in March 2005 for Mundra Special Economic Zone (MSEZ) for following purposes:

"MSEZ is proposed to be set up with self-contained facilities like Ind. Park Complex, Distribution Center, Commercial Complexes, Housing Complexes, Utilities like Water Supply, Drainage, Roads, Lighting, Social Infrastructure like schools, colleges, hospitals, townships, open air theatre, amusement park, etc. and provision for Air-field, helipad, railway station, roads (SH& NH), etc. over a total area of about 10,000 hectares.

This 10,000 hectares land is required to be in contiguous blocks as far as possible in the area identified which includes Govt. Waste Land, Forest Land, Private Land, etc.

The development will be as per the detailed project report. The class SEZs set up at JEBEL ALI-FTZ Dubai and SHENZEN PORT – HONGKONG."

11. Justification for the diversion of forest land was given as under:

"As per the policy of the Government India, SEZs are intended to be developed as self-contained township for industrial and commercial with required infrastructure for industrial/commercial activities like water supply, sewerage, adequate power supply, effluent treatment facilities, rail, road, port and airport connectivity for easy movement of cargo and service personnel and world class township having composite social infrastructure like schools, colleges, banks, hospitals, post offices, super markets, amusement parks and gardens, recreation centers and cinema halls and hotels and restaurants and world class commercial complexes for housing the offices of international trading and industrial organizations for setting up their activities in the Special Economic Zone.

In the case of Mundra SEZ, after eliminating the existing populated areas, contiguous land available are Government was land and forest land without useful vegetation and private uncultivable land. Moreover, the land in question is located in the vicinity of Mundra Port and railway line. The forest land proposed for diversion is within the overall boundary of the Mundra SEZ project. There is significant vegetation on the proposed forest land and the particular lands cannot be avoided for making contiguous land blocks. Moreover, the sea facing forest lands offer ideal scope for development of various SEZ activities without really sacrificing any forest.

For all the above said development contiguous blocks of lands are required to facilitate proper area planning.

Moreover, SEZ project is supposed to be in vicinity of sea port for providing easy movement of bulk cargoes. For the industries located in SEZ, re-export facilities will be excellent and will have benefits of some special privileges. The SEZ industries will generate huge employment for the country and benefits of value addition accrue to the nation while the benefits of duty exemption are availed by entrepreneurs locating their industrial units in SEZ."

12. The proposal was recommended by the DFO on 24.03.2005and the Chief Conservator of Forests Kuchchh Circle recommended the proposal on 15.05.2010 to the Nodal officer FCA Gujarat with the following observation:

    1. The user agency has already diverted the reserved forest of 2008.41 ha for the same cause, so this proposed area can be developed as forests only within SEZ. Therefore, there is no need for any diversion of forest land for the same cause.

3156

2. If this proposal is considered for the diversion than the forest of Siracha of an area of 394.10 may be excluded because of the unique prominent *Acacia nilotica* forest in the district.
3. The area is coastal area so at least 100 mt belt toward sea may be developed as green shelter belt only.
4. For proposed compensatory afforestation land, the Murachvan area is adjoining to forest area and favourable to wildlife. But the remaining two areas Junachay and Amara are not adjoining to any forest areas. Also, they are only grazing areas for local peoples. So, as CF, undersigned does not recommend to accept these areas as compensatory lands.
5. Therefore, these proposed Junachay and Amara areas may kindly be replaced with either at Nanamodungar having dominant indigenous trees cover, Keerodungar having Caracal site and breeding site for migratory birds or land in Abdasa taluka, having GIB habitat.

13. The Nodal Officer FCA recommended the proposal on 16.08.2010 to the with following recommendations:

The user agency has submitted proposal for diversion of 1576.81 ha of forest land for the purpose of developing SEZ. However, it is recommended for 1552.81 ha area, subject to following conditions:

1. There exist rights of local people as per forest settlement reports in the area. These rights may either be continued as such or the user agency should provide alternative at their cost.
2. As Siracha RF supports good patches of Deshi Babool (*Acacia nilotica*) and small wildlife, these patches, totaling to 269.25 ha area will be conserved *in situ* as Green Belt by the user agency.
3. User agency shall provide right of way of not less than 8 mts width within Dhrub RF area for the proposed diversion of 24 ha which has been excluded from the proposal of the user agency.
4. The non-forest land to Compensatory Afforestation shall be transferred to the Department duly demarcated and surveyed by DILR and after barbed wire fencing or trench mound fencing shall be provided by the user agency as decided by CCF, Kachchh.
5. User agency will develop green shelter belt of not less than 100 mts. width all along the adjoining coastal land of the proposed area under diversion.
6. Permission of the competent authority shall be obtained by the user agency for developing the area as SEZ.
7. It user agency fails to develop the area with 5 years from the date of the formal approval, the remaining area shall be reverted back to the Forest Department without payment of any refund or compensation of any kind.

14. The State Government has recommended the proposal on 21.01.2016 subject to the following conditions:

"Diversion of **1576.81** ha of forest land of Reserved forest land for development of Special Economic Zone and Industrial Park at village-Siracha, Navinal, Dhurab, Mundra, Borai, Gorasama, Luni, Bhadreshwar, Taluka. Mundra, Distt., Kutch in favour of Adani Group Mundra Port and Special Economic Zone Ltd, Ahmedabad" this proposal is recommended subject to the following conditions:

1	The user agency shall make necessary arrangements for right of the way for the local people from the diverted land. Plan of such arrangement with the consent of local people shall be submitted before the formal approval to this proposal.
2	All the conditions as recommended by the Chief Wildlife Warden shall be complied with the User Agency. (A copy is enclosed in this proposal)
3	The User Agency shall develop and maintain a green belt at Siracha Village for *in situ* conservation of Indian Birds and Wolfs, hence 100 ha. area of Siracha village may be excluded from the diversion. Exact location of 100 ha. from the total demanded land of Siracha village can be decided at the time of formal approval.
4	If 122 ha. of Village – Zarpapa- 683 ha., of GMB or any other revenue land is allotted for this SEZ then equivalent land from land shall be reduced from the demanded forest land for this SEZ.
5	The Compensatory Afforestation land shall be surveyed at the cost of User Agency and erect pillars and barbed wire fencing or trench under the consultation of CCF, Kutch Circle.
6	The user agency shall develop the 100 mts shelter belt at adjoining sea side.
7	Approval of Developing SEZ shall be obtained by the User Agency from concerned authority.
8	The diverted shall be utilized for the purpose of the SEZ within 5(five) years from the date of the formal approval. If the user agency fails to do so, the unutilized forest land shall be recovered by the Forest Department.
9	The User Agency shall obtain Environment Clearance, CRZ Clearance before the commencement of the work.
10	The Compensatory Afforestation land shall be handed over to the State Forest Department without any liability and encroachment before the formal approval to this proposal.

17

3158

11	All the conditions of the formal approval of 2008.41 ha forest land shall be diverted shall be complied with before the formal approval of this proposal
	(a) 3770 ha non-forest land of Kutch district shall be transferred to the state Forest Department before the formal approval to this proposal for the Ghorad Sanctuary.
	(b) Compensatory Afforestation for the approval of 2008.41 ha of forest land shall be transferred to the State Forest Department before the formal approval to this proposal.
	(c) The User agency shall pay the cost of fencing in Compensatory Afforestation land to the State Forest Department before the formal approval to this proposal.
	(d) The user agency shall pay the difference amount of 5.35 Crores for the firewood estimation from 2008.41 ha forest land before the formal approval to this proposal.
	(e) Any other conditions of the formal approval of the 2008.41 ha diverted forest land before the formal approval of this proposal.
12	Diverted forest land shall not be utilized for Golf Course, Bench Resort, Park or Residential purposes or any other activity prohibited by FCA 1980 and/or guidelines there under.
13	The user agency shall comply the additional conditions of processing fee, Registration fee, Additional Compensatory Afforestation Land, Amount for Additional Compensatory Afforestation Land and additional Compensatory Afforestation Land and additional amount as per Government of Gujarat's GR No. FCA-1013/11-10/SF-24/F Dated 12.06.2015
14	The user agency shall comply the provisions of Forest Right Act, 2006 before the formal approval of this proposal.
15	Recommendations of the Nodal Officer is submitted by its letter no. JMN/29B/A/806/2015-16 dated 28.12.2015 (A copy is enclosed in this proposal)

15. The said proposal was considered earlier also by the FAC in its meeting held on 20.07.2017 and based on the facts made available on the date of FAC meeting, the following information were sought from the State Government:

(i) Detailed land use plan has not been submitted and therefore the State government shall provide detailed land use of the whole area including forest and non-forest land.

(ii) State government will analyse and examine the land use plan and submit a proposal for diversion of forest land for non- forestry purpose for only those land use which are permissible under the guideline of FCA 1980.

(iii)MOEF&CC had accorded prior approval under section 2(ii) of FC Act, in favour of M/s Mundra Port, for diversion of reserved forest area of 57.75 ha, for laying of Railway line vide letter No. 8-163/97FC, MoEF, New Delhi, dated 24.07.2004, and 1840.00 ha. & 168.41 ha. for development of port based SEZ vide No. 8-2/1999-FC(Pt), dated 27.02.2009. It has been fulfilled/complied by the user agency. The State Government shall submit complete compliance of all stipulations of past approvals under section 2(ii) of FCA, 1980.

(iv) Site inspection was carried out by the regional office for **1476.81 ha** whereas state government has now recommended the proposal for total **1576.81 ha**, which include 100 ha of *Acacia nilotica* patch , with condition that the same may be diverted by allowing user agency to pay five times of NPV of forest area. This patch is a part of 394 ha of forest of Sircha village which CF Kutch had recommended to be excluded. **Regional office may inspect the area again and give specific comments on exclusion/inclusion of 100 ha or 394 ha into the proposal.**

(v) State Government may kindly give justification for notifying the forest area as part of SEZ (special economic Zone) without seeking prior permission under the provision of Forest conservation act 1980.

(vi) It is reported that the part of non- forest area is being utilized as SEZ and now the proposal is for the balance patches of forest area which are required to be included in SEZ to make the total area as 10000 ha. From the review of the map and justification of the state it is learnt that it is statutory requirement of custom department that for processing zone of SEZ it should be located on contiguous pieces of land and that there should be over all contiguity in the various components of SEZ. State Government had further justified that there is no option than to opt for the diversion of forest land to be included in the SEZ. The State Government may be asked why this matter was not brought to the notice of FAC earlier.

(vii)State Government shall give very specific recommendation regarding suitability of Compensatory afforestation land.

(viii) State Government shall submit complete compliance of FRA.

16. Accordingly, the State Govt. and Regional office, Bhopal was requested vide the Ministry's letter dated 24.08.2017 to furnish the information as sought by FAC in its meeting held on 20.07.2017 The State Government vide their letter no. FCA-1014/10-11/14/S.F-66/F dated 01.12.2017 has submitted their compliance report as under:

S. No.	Reply of State Govt.
i. & ii	In this regard, the State Govt. reported that the user agency has submitted details pocket wise land use plan as per the FCA, 1980 guideline and is attached in their reply as Annexure-A (pg. 803/c), as submitted to CCF, Kutch & Nodal Officer. Detailed land use plan is in accordance with their project needs and project components. User agency has provided detailed land use plan and has given confirmation that diverted forest area for only

3160

	those land uses which are permissible under the guideline of FCA, 1980.	
	The details of proposed land use are as follows:	
	Proposed land use	Area in ha.
	Power Plant 1000 MW X 3	59.9
		209.2
	Copper Smelter Plant – 1 MT capacity	125
	Coal to Polygeneration – 10 MT capacity	89.52
	CFS & warehousing	81.59
	Engineering Cluster	5.21
	Mix Industrial cluster viz engineering ware house etc and social Infrastructure as per FCA 1980 guidelines viz schools, hospitals/ dispensary, community halls, cooperatives, etc.	41.45
	CFS & warehousing	51.46
	Commercial Airport with MRO, Storage yards, fuel tankers, terminals etc.	84.98
		112.06
	Engineering Cluster with Water front for manufacturing and assembly of Crane, Boilers, project cargo, port operation equipment, etc and Liquid storage tanks farm.	516.44
		200
	Total	1576.81
iii.	In this regard, the State Govt. reported that compliance of all conditions put forward in final Approval given by the Govt. of India.	
	In principal approval has been granted by Govt. of India vide letter No. 8-2/1999-FC (PT) dated 27.02.2009 for land admeasuring 1840 ha and 168.41 ha to Adani Ports and SEZ Ltd for development of port based Special Economic Zone. Compliance of conditions laid down in In-principle approval granted by the Govt. of India.	
	For the condition No. 8 of in principle approval no. 8-2/1999-FC (PT) dated 27.02.2009, 3752.30 ha land is transferred in the name of Forests & Environment Department out of 3700.00 ha land of which was possessed by GEDA.	
	For the Conditions No. 17, 18 & 19 of Memorandum No. FCA-1009(10-14) SF-18-K dated 17.11.2009, the user agency has given the Bank Guarantee of **Rs.77300000.00.** User agency has provided detailed compliance of all conditions put forward in Final Approval given by the Govt. of India	
iv.	In this regard, the State Govt. reported that at one point of time in 2009, **the then Conservator of Forest, Kutch has directed to exclude an area of 394 ha in Village Siracha, stating that 100 ha patch possess good vegetation and presence of wild animals.** The State Govt. accordingly recommended final proposal with deduction of 100 ha land out of this 394 h	

	in Jan. 2016.
	However, User agency requested State Govt. for the re-survey of the Siracha land stating that the Wild life report is quite old i.e. of 2009 and at present no wildlife and exotic vegetation is available in that area. The survey was carried out by CCF, Kutch office and founded that there was negligible movement of wildlife as per report and Acacia Nilotica is present only in one corner of the land parcel. Further, the area of 100 ha of Siracha is in close proximity to existing power plant and as represented by user agency this Forest land of Siracha is necessary for their expansion of Power Plant, due to integration with existing power plant. **User agency has also represented and agreed to pay 5 times NPV in line with FCA provision of addressing the situation of diversion of Wild life protected area.** User agency feels that there is no other alternative for 100 ha land and for that DCF Kutch East has recommended not to exclude 100 ha land.
	But, as per reference of Minutes of Meeting of Forest Advisory Committee held on 20.07.2017, APCCF, Regional Office, Bhopal has conducted the site inspection once again on 26.09.2017 to decide for 100 ha Siracha forest land. Previously, it was done on 06.05.2016. So now this aspect pertains to Regional Office Bhopal and its further report on latest site inspection report.
v.	**In this regard, the State Govt. reported that Ministry of Commerce and Industry, Govt of India has granted in principle permission for total 10000 ha of Special Economic Zone (SEZ) to User Agency in 2001 under State Govt's Exim Policy 2000.** In the meantime, user agency has acquired 6456 ha land in piece meal through private land, direct allotted Govt land and Govt land allotment through Gujarat Maritime Board. **As and when user agency got the possession of land, it was further notified as SEZ Area after getting approval from Ministry of Commerce and Industry, GoI.** Further, the area of 1840 ha and 168 ha forest land has been diverted to APSEZL by Forest Department in Nov-2009 has also been notified for SEZ area in April-2015 and March-2012 respectively.
	Thus, as of now total 8464 ha of area has been declared as SEZ Area.
	The area declared as SEZ area earlier is adjacent to various pockets of this 1576 ha forest land, which is proposed for diversion by User Agency. The area of 1576 ha as proposed for allotment by User Agency has not been declared as SEZ Area as it is not in their possession. As informed by user agency, they will approach Ministry of Commerce and Industry, Government of India to declare this area as SEZ area only after the area is diverted to User Agency.
	Ministry of Commerce and Industry, Govt. of India has granted in principle permission for establishing SEZ in total 10,000 ha of Special Economic

3162

	Zone (SEZ) to User Agency in 2001 under State Govt.'s Exim Policy 2000.
	That the forest land, is required to complete the SEZ land requirement for establishing SEZ has been mentioned in the original proposal and has been provided in various comments, offered by user agency and this office.
	Thus, as of now total 8464 ha of area, acquired in piece meal through Private land, Direct Govt. allotted land and Govt. land allotment through Gujarat Maritime Board has been declared as SEZ area.
	As informed by user agency, they will approach Ministry of Commerce and Industry, Govt. of India to declare this area as SEZ area only after the area is diverted to User Agency.
vi.	**In this regard, the State Govt. reported that the** proposal of User Agency for area under consideration is adjoining to already declare as SEZ of 8464 ha land. There is no other land except Forest Land. Hence, User agency has proposed for diversion of Forest Land.
	Ministry of Commerce and Industries, Govt. of India has granted In-principle permission for establishing SEZ in total 10000 ha of Special Economic Zone (SEZ) to User Agency in 2001 under State Government's Exim Policy, 2000.
	That the land is required to complete the SEZ land requirement for establishing SEZ has been mentioned in the original proposal and has been provided in various comments, offered by user agency and his office.
	It is statutory requirement of customs department that for processing zone of SEZ, it should be located on contiguous pieces of land and that there should be over all contiguity in the various components of SEZ. This aspect has been submitted by the State Government earlier, in its project justification and other clarifications provided.
vii.	The State Govt. stated that the detailed scheme for Compensatory Afforestation and land suitability was already prepared in Sept-2008 while processing the proposal. But, as per the opinion of then Conservator of Forests, Kutch that Non-forest Land of Junachy and Amara area offered as CA land by User Agency is not adjacent to existing forest land and therefore not suitable for afforestation.
	However, as per the latest resolution of State Government dated 15.05.2017 whenever the Non-forest land being offered as Compensatory Afforestation land is not possible to be contiguous to existing forest land and if the area of diversion is 100 ha or more area the CA land should not be less than a patch of 25 ha. Considering this guideline the CA offered land at Junachy and Amara was found suitable.
	State Government vide its GR dated 15.05.2017 has provided guidelines for suitability of private land for compensatory land. Considering this

3163

	guideline, the CA offered land at Junachy and Amara was found suitable.
	Suitability Certificates along with scheme of Compensatory Afforestation and land suitability for land area of 503.01 ha of Village Murachban, Taluka. Lakhpat, 283.80 ha of Village Junachy, Taluka.Lakhpat and 790 ha of Village Amara, Taluka.Nakhatrana have been provided by DCF accordingly.
	However, User Agency has given undertaking if forest department is not ready to accept proposed CA land as mentioned above, it will be changed and new CA areas will be provided before the issuance of final approval.
viii.	The State Govt. stated that an Undertaking has been given by the User Agency that all formalities as per the Guidelines of Forest Rights Rules-2006 of Government of India will be completed before final approval. So, undertaking of User Agency may be provided.

17. After the FAC meeting on 20.07.2017, theMinistry vide it's letter dated 24-08-2017 requested the Regional Office, Bhopal to **inspect the area again** and give specific recommendations on the exclusion / inclusion of 100 hectares or 394 hectares of forest area in the proposal.The Regional office inspected the project area on 26.09.2017 with the specific and the only objective of evaluating the recommendation of the State Government of Gujarat to include 100 ha of 394.10 ha of Siracha village into the project. SIR was done along with Shri U.D. Singh, APCCF (Land), GOG, Shri P.S. Randhava, CCF, Kutch and the senior officers from the User Agency. Based on the field observations during inspection, the discussions held at the time of inspection with User Agency officers as well as officers of State Forest Department, Regional office recommended the proposal for consideration of diversion of 394.10 hectares of forest area of Siracha village for the following reasons:

a) The forest land of Siracha village is adjoining the existing power plant of the User Agency. During field inspection the User Agency representatives informed that the forest land of Siracha village is required for the expansion of the existing power plant which was initially developed keeping in view the future expansion. Therefore, for the expansion of existing power plant, the User Agency has no option for alternative site and its requirement are integral for implementation, operation and expansion of future component.

b) The Siracha forest land is an isolated patch of forest measuring 394.10 (Map prepared by BISAG). *Though, it is good forest, however, since it is surrounded from all sides by habitation and various kinds of infrastructure it does not, therefore, possess high conservation value. During inspection, regional office found no major signs of wild life.* The last Inspection Report of Regional Office, Bhopal dated 06.05.2016 also under paragraph 19 mentions that during site visit, no significant wild life was seen. With the

3164.

full development of SEZ, its conservation value would be further undermined. It the CA area is developed contiguous to an existing large forest area with good potential for conservation the loss on account of 394.10 ha of forest area would be adequately compensated.

c) Generation of power is one of the key requirements for the development of the country. The 3000 MW proposed to be generated, as informed by the User Agency, through the said expansion of adjoining power plant near Siracha, in regional office's well-considered opinion, would be far less detrimental to the overall environment as compared to another standalone thermal power plant established elsewhere to produce same amount of power. The main reason for this is that such a standalone power plant in the hinterland would be supplied huge quantity of required coal transported through railway or road whereas the proposed expanded thermal power plant would be fed coal by a conveyor system (as informed by User Agency during inspection) from Mundraport to the power plant. Secondly the expansion would use the existing sea water facility for cooling and consumptive purpose thus avoiding use of huge quantity of fresh water if the new plant were to come up elsewhere. Thirdly, the expansion would use the existing infrastructure facilities for evacuation of power.

d) The State Government has recommended payment of five times the NPV for the 100 hectares of forest area coming under diversion for non-forest use for the project.
In other words the APCCF (C), Regional Office has recommended the diversion of 394.10 ha of good forest, citing reason that it will have no future conservation value, for future expansion of TTP by APSEZL albeit at 5 times the NPV.

18. Form the documents examined by the FAC in meeting dated 25.01.2018 it is learnt that the Mundra special economic zone is proposed to set up with self-contained facilities like Industrial park complex, distribution centre, commercial complexes, Housing complexes , utilities like water supply, drainage, roads ,lighting, social infrastructure like school, colleges, hospitals , townships, open air theatre, recreation centre, cinema hall, amusement park etc and provision for air field, helipad ,railway station, roads(SH &N.H) etc over total area. The User Agency has now agreed to change the land use of forest land as informed by State Govt. vide its letter dated 01-12-2017 and the proposed changed land use of forest land is now indicated under para 16 above.

FAC deliberated on the fact that establishment of port based SEZ is necessary for the development of the country. On analysis through DSS it is observed that most of the forest area and revenue areas are under non forestry use and some patches of forest areas are available inside SEZ. In view of the clarification submitted by the State Government vide letter dated 01-12-2017 FAC recommends the grant of In Principle Approval for the diversion of **1552.81 ha** (1576.81-24 ha) of forest land subject to general standard and following specific conditions.

i The Nodal officer, FCA had recommended in 2010 that though the user agency has submitted proposal for diversion of 1576.81 ha of forest land for the purpose of developing SEZ only 1552.81 ha area may be diverted excluding 24 ha in Dhrub RF, subject to specific conditions.. It was recommended that the user agency shall provide

3165

right of way of not less than 8 mts width for 24 ha which has been excluded from the proposal of the user agency. The details of settlement of rights shall be provided.

ii The diverted forest land measuring 1552.81ha shall be maintained as green area within the APSEZ and the diversion for non-forestry purpose will be considered only on case to case basis by the ministry for the purpose required for SEZ.

iii Diverted forest land shall not be proposed to be utilized for Golf Course, Beach Resort. Park or Residential purposes, or any other activity prohibited by FCA 1980 and/or guidelines there under

iv From the DSS analysis it is observed that Aerodrome already exists in the zone. The diverted forest land will not be proposed for the construction of private Aerodrome as demanded by the use agency. The forest land may be considered, in future on merits, in case of commercial Airport is developed with the approval of DGCA.

v The detailed existing land use with maps of all forest land 2008.41 ha (1840ha + 168.41 ha) for which the approval was granted vide 30.09.2009 and details of complete land use including forest land for the existing private Aerodrome and power plants within the SEZ may be provided.

vi 100 meter wide green shelter belt along the sea coast except in the waterfront area shall be included in the Master Plan of APSEZ.

vii Complete compliance of CRZ regulations shall be ensured.

viii All the conditions as recommended by the Chief Wildlife Warden shall be complied with the User Agency.

ix The Compensatory Afforestation land shall be surveyed at the cost of User Agency and erect pillars and barbed wire fencing or trench under the consultation of CCF, Kutch Circle.

x Compensatory afforestation shall be raised over identified non forest land equivalent to the diverted forest land diverted and at least 1000 plants per hectare (1552.81 hectares x 1000 = 1552810 plants) shall be planted with provision for ten years on subsequent maintenance.

xi 25% of revised CA cost will be deposited extra by the user agency for soil and moisture conservation (SMC) activities on the CA land.

xii Complete compliance of Forest Right Act 2006 to be done for the 1576.81 ha of forest land by the State Government.

xiii To provide protection to the existing wildlife a patch of natural forest in Luni to Harmiramora village shall be kept as green belt without carrying out any activities in that area as recommended by the CCF Kutch Circle vide letter dated 15.5.2014 to PCCF Wildlife Gujarat. The recommendation of the Chief wildlife warden Gujarat sent vide No WLP/663/32/B/1778-79/2014 dated 30.5.2014 must be complied.

xiv The State Government will inform about the status of the land measuring 122 ha in village Jarapara and 683 ha of land belonging to GMB has been transferred to APSEZL. This area need to be deducted from the proposed forest land diversion as recommended by the State Government.

3166

xv State government will provide the terms and conditions on which the forest is proposed to be transferred on lease to the use agency The detail of lease period, terms, conditions and consideration, if any, may be provided.

xvi All other conditions imposed in the approval granted for diversion of 2008.41 ha (1840ha + 168.41 ha) forest land on 30.09.2009 shall be complied.

Agenda No. 4

F. No. 8-115/2000-FC

Sub: Diversion of 19.52 ha of forest land for raising the height of Barvi Dam for submergence and rehabilitation in District Thane of Maharashtra.

The above stated agenda Item was considered by FAC on 25.1.18 and observed as follows:

1. The State Govt. of Maharashtra vide their letter no. FLD-1215/CR-292-F-10 dated 15.09.2015 has submitted a proposal for diversion of 19.52 ha of forest land for raising the height of Barvi Dam for submergence and rehabilitation in District Thane of Maharashtra to Regional Office, Nagpur.
2. This is a dam being constructed since 1968 to meet the demand of water for industrial and drinking purposes. MoEF&CC vide its letter no. 8-115/2000-FC dated 19.12.2005 had accorded approval for diversion of 513.66 ha of forest land. The proposed height of the dam at the time of approval was 62.05 meter. It is reported that this projects was envisaged to be constructed in three stages. In second stage the height was raised up to 65.05 m and in third stage the height is proposed to be raised up to 72.06 m.
3. The proposal for additional area of 19.52 ha was submitted to REC Nagpur.
4. The stated proposal was considered by the REC in its meeting held on 25.01.2015. The Addl. PCCF & Nodal Officer (FCA), Government of Maharashtra and representative of the user agency were also present in the said Regional Empowered Committee (REC) meeting. After detailed examination of the proposal and interaction with the Nodal officer (FCA) and representatives of the User Agency, the REC observed as under:
   i. The Committee noted that project envisages raising the height of Barvi Dam in Thane District in the State of Maharashtra to meet the increased demand of water for industrial and drinking purposes. Project was already completed and in the 3rd stages out of which two stages area already completed and in the **3rd Stage of the project, height of dam is proposed to be increased by 7.01 meters i.e. from RL 65.05 meters to 72.06 meters to augment the storage capacity of the reservoir to meet the increased demand of water in the region.**
   ii. The Committee also noted that Government of India vide its letter no. 8-115/2000-FC dated 19.12.2005 had accorded approval for diversion of 513.66 ha of forest land. However, while submitting the initial proposal for diversion of 513.66 ha of

MEMORANDUM OF UNDERSTANDING (MOU)

THIS MOU is entered on this 14th day of March, 2019 Year between **Adani Enterprises Limited,** a company registered under the Companies Act, 2013, and having its registered office at Adani House, Near Mithakhali Six Roads, Navrangpura, Ahmedabad 380009, Gujarat, India (hereinafter referred to as **"AEL"**, which expression shall, unless excluded by or repugnant to the context or meaning thereof, be deemed to include its successors and assigns) being the party of the **FIRST PART,**

and Adani Port & SEZ Ltd, a Company registered under the Company's Act 2013 and having its registered office at 1st Floor, Infrastructure House, Nr. Adani House, Navrangpura, Ahmedabad (hereinafter referred to as **"APSEZ"** which expression shall, unless excluded by or repugnant to the context or meaning thereof, be deemed to include its successors and assigns) being the party of the **SECOND PART.**

Both AEL & APSEZ may hereinafter also be referred to jointly as the **'Parties'** and severally as a **'Party'**

ADANI PORTS AND SPECIAL ECONOMIC ZONE LTD

ADANI ENTERPRISES AHMEDABAD

3168

WHEREAS

AEL is setting up an integrated copper smelting & refinery complex at Mundra, Gujarat (hereinafter referred to as "**Plant**") with an annual production capacity of 10, 00,000 TPA.

Since, APSEZ is already having the land, power & water availability in the proposed area, AEL would like to utilize these resources for its Plant.

NOW, THEREFORE, IN CONSIDERATION OF THE ABOVE PREMISES AND OF THE UNDERTAKINGS HEREIN FURNISHED, IT IS HEREBY AGREED BY AND BETWEEN THE PARTIES AS FOLLOWS:

APSEZ will make available to AEL 256.58 hectares of land on long term lease basis. Out of the total requirement of 256.58 hectares of land, currently APSEZ is in possession of 154.19 hectares of land which can be readily made available for the project. The balance 102.39 hectares of land is under forest diversion process and will be handed over to the project once APSEZ receives the possession of the land. The complete details of the land is placed at Annexure-I of this MOU.

APSEZ will make available to AEL 300 MW of power & 32,800 m3/day of desalinated water for the Plant operations.

The payment terms & the other commercial terms & conditions will be mutually decided by both the parties at a later convenient date.

EFFECTIVE DATE, COMMENCEMENT DATE & VALIDITY OF THE MOU

1. The effective date shall be the date of this MOU.
2. This MOU shall remain valid till the time a definitive detailed agreement incorporating all the commercials, scope, penalty and legal related matters is executed between the parties.

SETTLEMENT OF DISPUTES

1. In case of any disputes, differences, claims between the parties hereto arising out of this MoU, the same shall be referred to respective senior management of each Party, who in turn will work out an amicable settlement.

OTHER CONDITIONS:

1. Any amendment to this MoU in order to be valid shall be in writing.
2. This MoU shall be executed in duplicate and both the counterparts shall be treated as original.

ADANI PORTS AND SPECIAL ECONOMIC ZONE LIMITED * ADANI PORTS

ADANI ENTERPRISES LTD. AHMEDABAD

Validity:

This MoU shall remain valid until execution of the Definitive Agreements to this effect.

IN WITNESS WHEREOF THE PARTIES HERETO HAVE HEREUNTO SET THEIR RESPECTIVE HANDS AND SEALS THE DAY, MONTH AND YEAR FIRST ABOVE WRITTEN.

ADANI PORTS AND SPECIAL ECONOMIC ZONE LTD.

ADANI ENTERPRISES LTD. AHMEDABAD

EAC OBSERVATION:

CRZ map inter-alia including demarcation of HTL/LTL/CRZ land classification along with super imposition of plant site through competent agencies has not been submitted.

REPLY:

The map of proposed project is superimposed on CRZ map of the area prepared in 2011 by Centre of Earth Science Studies (CESS), Thiruvanantapuram, an institute recognized by Ministry of Environment, Forest & Climate Change (MoEF&CC), Government of India. The proposed project site is outside the CRZ. This map is shown as Figure-1.5 in the Chapter-1 of EIA and also attached herewith.

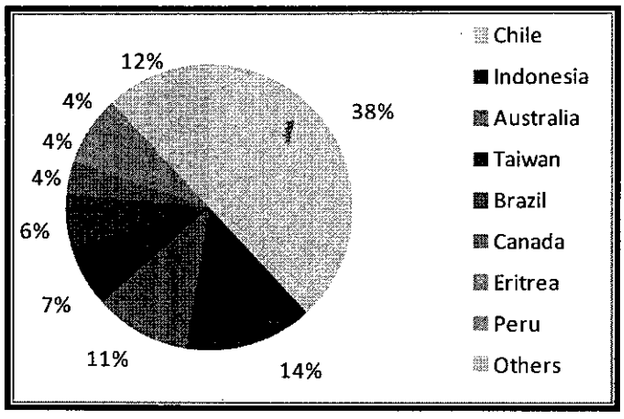
Further, National Centre for Sustainable Coastal Management (NCSCM), Chennai which is a nodal agency for CRZ mapping and preparation of CZMP for Gujarat, has been engaged for the superimposition of the proposed Copper Refinery plant layout on authenticated CRZ map of district Kutch.

NCSCM has communicated that this superimposition of the proposed Copper Refinery plant layout on CRZ Map would be done after approval of CZMP map of Kutch District as the CZMP of district Kutch is under approval process by Govt of Gujarat.

EAC OBSERVATION NO.-3

3172

EAC OBSERVATION:



Source of copper ore concentrate, characteristics, mode of transportation from source to plant site, confirmed ore linkage document has not been submitted.

REPLY:

Copper Concentrate for the proposed project will be sourced from the following countries:

- Latin American Countries such as Chile, Peru, Brazil
- ASEAN Countries such as Indonesia, Philippines
- Australia
- Africa
- Canada
- USA

Copper Concentrate is basic raw material for the Copper Smelter. Latin American countries are the major supplier of the raw material. Copper Concentrate for the proposed project will be sourced through various mines across the globe. There is adequate reserves for the Copper are available and hence sourcing of the Copper Concentrate will not be constraint. Please find below the chart showing the receipt of the Copper Concentrate from different countries for copper smelters available in India.

World copper mine production is growing around 3% per annum and is 20 Million Tons in 2017. 42% of production is coming through Latin American countries and 17% from Asia. Europe and North America contributes 13% each. Chilli, Peru, Australia, Indonesia are some of the major countries exporting copper concentrate. China, Japan, Korea, Germany and India are the major importers of copper concentrate. A detailed Copper Concentrate Market Report prepared from International Copper Study Group (ICSG) is being presented in **annexure- 3(a).**

For long term ore (Copper Concentrate) linkage various supplier have been approached and comfort letters from various suppliers have been attached in **annexure- 3(b).**

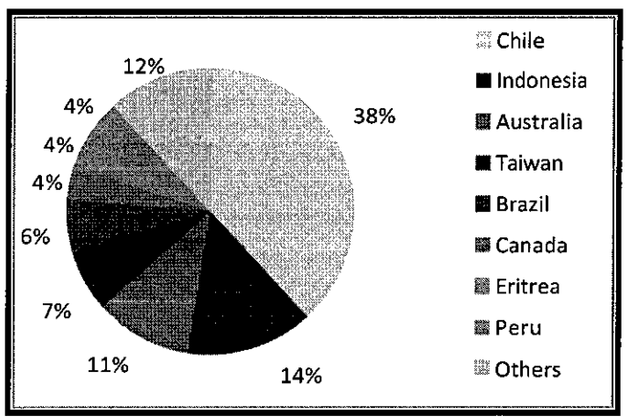
3173

EAC OBSERVATION NO.-3

The typical copper concentrate analysis is shown below;

Species	Unit	Smelting Input Range
Cu	Wt%	24 - 28
Fe	Wt%	24 - 29
S	Wt%	30 - 34
SiO_2	Wt%	< 10
CaO	Wt%	< 1.0
MgO	Wt%	< 1.0
Al_2O_3	Wt%	< 2
Zn	Wt%	< 3
Pb	Wt%	< 1.5
Fe_3O_4	Wt%	< 1.5
H_2O	Wt%	< 8
As	g/t	< 2500
Se	g/t	< 300
Bi	g/t	< 200
Sb	g/t	< 150
Ni	g/t	< 350
Te	g/t	< 100
Cd	g/t	< 20
Cr	g/t	< 45
Cl	g/t	< 400
F	g/t	< 1500
Hg	g/t	< 40

Copper Concentrate will be unloaded from the vessel and transported to intermediate facility at port storage by closed conveyor system. The storage facility at the port and plant will be a closed and paved with concrete.



Copper Concentrate will be transported from port to plant by closed conveyor system or by closed trucks. Dust extraction/ suppression system to handle dust will be provided at the truck unloading point.

Copper concentrate storage facility will be provided and paved with concrete. All the transfer points will be fitted with dust extraction/ suppression system to handle dust. Detail drawing of the storage facility is attached in **Annexure-6.**

3174

Copper Concentrate Market Outlook

Copper Concentrate is basic raw material for the Copper Smelter. Latin American countries are the major supplier of the raw material. Copper Concentrate for the proposed project will be sourced through various mines across the globe. There is adequate reserves for the Copper are available and hence sourcing of the Copper Concentrate will not be constraint. Please find below the chart showing the receipt of the Copper Concentrate from different countries in India.

Below are the some of the extract information from International Copper Study Group – World Copper Fact book 2018.

1. Long term Availability of Copper
2. World Mine Production
3. Mine Production By Region
4. Top Copper Concentrate Producing Countries
5. Top 20 Mines by Capacity
6. International Trade Flow for Copper Concentrate.

3175

ANNEXURE-3(a)

Copper Resources and Long-Term Availability of Copper

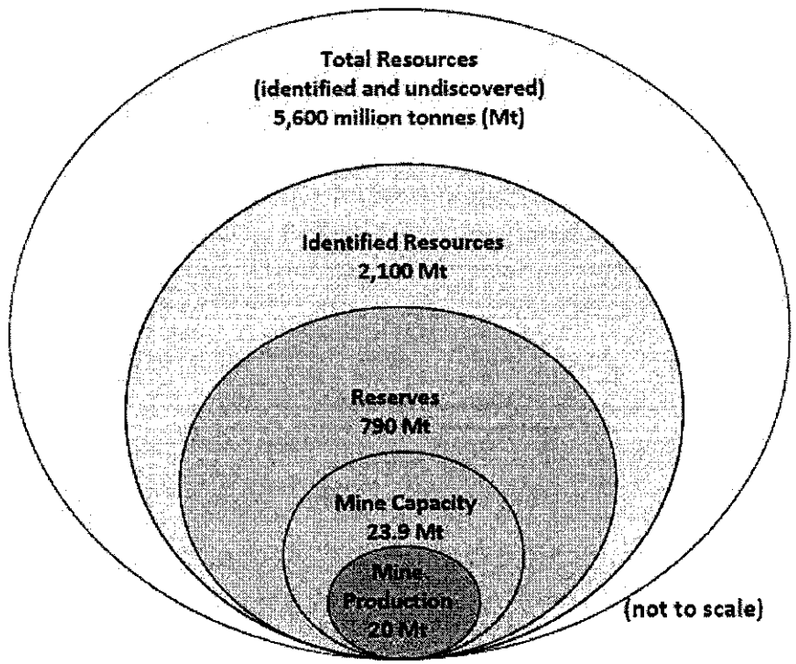
Copper Reserves and Resources

Typically, the future availability of minerals is based on the concept of reserves and resources. Reserves are deposits that have been discovered, evaluated and assessed to be economically profitable to mine. Resources are far bigger and include reserves, discovered deposits that are potentially profitable, and undiscovered deposits that are predicted based on preliminary geological surveys (see definitions below).

According to the United States Geological Survey (USGS), copper reserves currently amount to around 790 million tonnes (Mt) and identified and undiscovered copper resources are estimated to be around 2,100 Mt and 3,500 Mt, respectively. The latter does not take into account the vast amounts of copper found in deep sea nodules and land-based and submarine massive sulphides. Current and future exploration opportunities will lead to increases in both reserves and known resources.

Definitions (http://minerals.usgs.gov/minerals/pubs/mcs/2014/mcsapp2014.pdf)

Resource: A concentration of naturally occurring solid, liquid, or gaseous material in or on the Earth's crust in such form and amount that economic extraction of a commodity from the concentration is currently or potentially feasible.



Identified Resources: Resources whose location, grade, quality, and quantity are known or estimated from specific geologic evidence. Identified resources include economic, marginally economic, and sub-economic components.

Undiscovered Resources: Resources, the existence of which are only postulated, comprising deposits that are separate from identified resources. Undiscovered resources may be postulated in deposits of such grade and physical location as to render them economic, marginally economic, or sub-economic.

Reserves: That part of the reserve base (part of an identified resource that meets specified minimum physical and chemical criteria related to current mining and production practices, including those for grade, quality, thickness, and depth) which could be economically extracted or produced at the time of determination. The term reserves need not signify that extraction facilities are in place and operative.

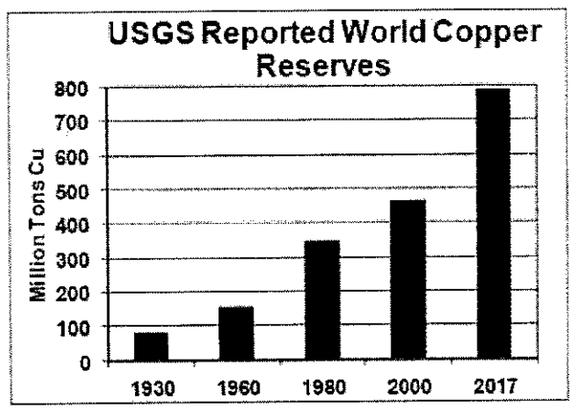
The World Copper Factbook 2018

Global Distribution of Identified and Undiscovered Copper Resources in Porphyry and Sediment-hosted Stratabound Copper Deposits [1/]

In 2013 the U.S. Geological Survey (USGS) completed a geology-based, cooperative international assessment of copper resources of the world [2/]. The USGS assessed undiscovered copper in two deposit types that account for about 80% of the world's copper supply. Porphyry copper deposits account for about 60% of the world's copper. In porphyry copper deposits, copper ore minerals are disseminated in igneous intrusions. Sediment-hosted stratabound copper deposits, in which copper is concentrated in layers in sedimentary rocks, account for about 20% of the world's identified copper. The mean undiscovered totals for porphyry and sediment-hosted deposits are 3,100 and 400 Mt respectively, resulting in a global total of 3,500 Mt of copper. With identified copper resources currently estimated at 2,100 Mt, total copper resources (undiscovered + identified) are estimated at 5,600 Mt.



1/ Undiscovered Copper Resources - A Global Assessment, April 2014, Presentation at ICSG meeting, Lisbon, by Mrs *Jane M. Hammarstrom (USGS Global Mineral Resource Assessment Team)*
2/ Supporting studies, including documentation of the assessment methodology and descriptions of individual tracts, are available on the USGS Mineral Resources Program Web site, at *http://minerals.usgs.gov/global/*.

International Copper Study Group

Are We Going to Run Out of Copper[1]?

It is highly improbable. Since 1950, based on the then current rate of demand, there has always been, on average, 40 years of reserves, and significantly greater amounts of known resources (USGS data). In addition, recycling, innovation and mining exploration continue to contribute to the long-term availability of copper.

Despite increased demand for copper produced from ore in recent years, increases in reserves have grown, and there is more identified copper available to the world than at any other time in history.

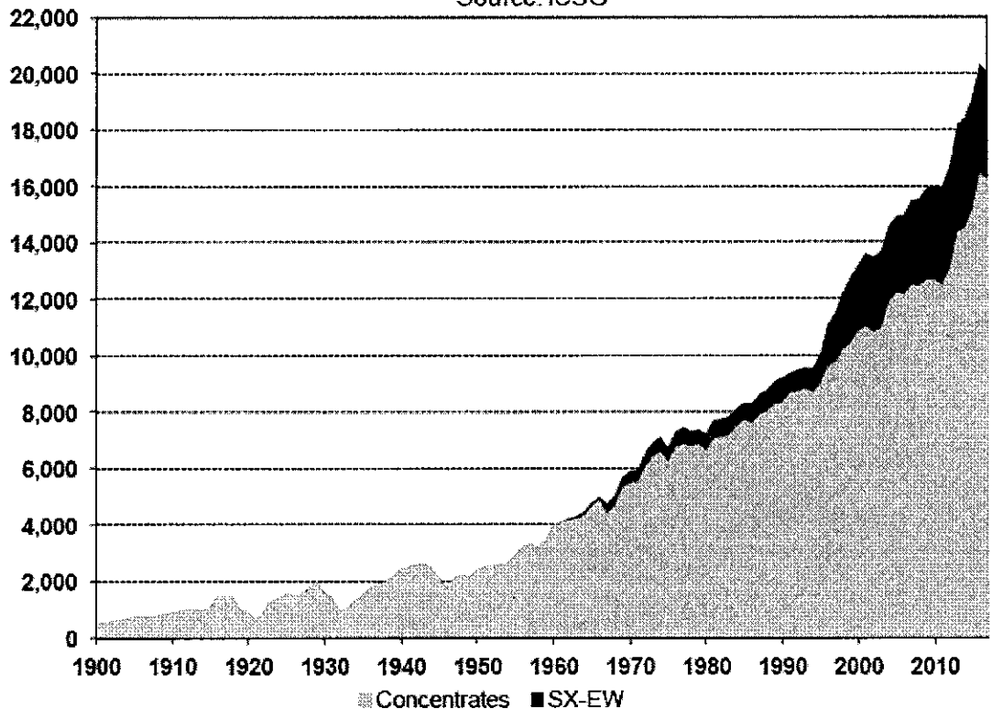
In the period 2007-2017, 192 million tonnes of copper have been mined. In that same period however, reserves have grown by 300 million tonnes. This reflects additional exploration, technological advances and the evolving economics of mining.

Technology has a key role to play in addressing many of the challenges faced by new copper production. Known and as yet unknown innovations will ensure new mine production continues to provide vital copper supplies.

In addition copper recycling plays an important role in copper availability since today's primary copper is tomorrow's recycled material. Unlike other commodities such as energy or food, copper is not "consumed". Copper is one of the few raw materials which can be recycled repeatedly without any loss of performance, and key stakeholders such as policy-makers, scrap collectors, copper producers and recyclers must all focus on ensuring that yesterday's metal is recycled and re-used.

While this will ensure a progressive move towards a more sustainable economy, the loop cannot be completely closed for two reasons. Firstly, demand will continue to increase due to population growth, product innovation and economic development. Secondly in most applications, copper stays in use for decades.

Consequently, meeting future metals demand will continue to require a combination of primary raw materials, coming from mines, as well as recycled materials, while innovative policies and technology should continue to contribute to improvements in recycling performance and resource efficiency.



Based on the latest knowledge on geological availability and continuous industry innovation there are good reasons to believe that copper will continue to be a vital and positive contributor to society well into the future.

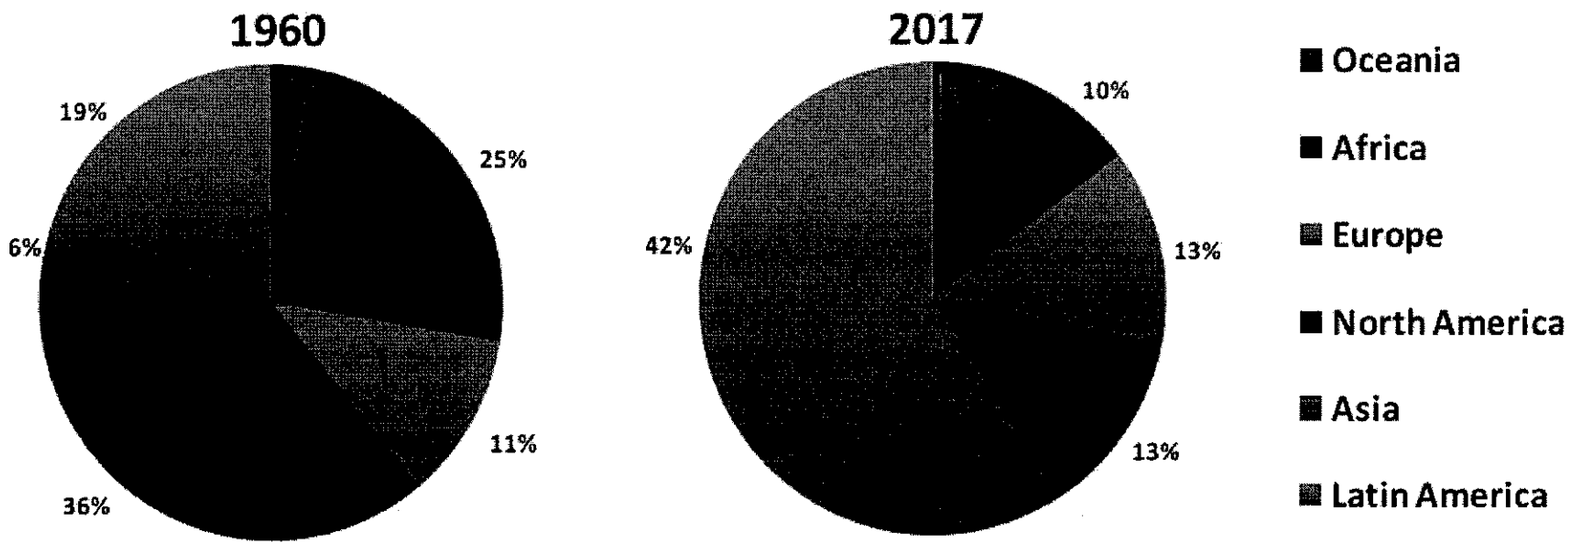
ANNEXURE-3(a)

Copper Mine Production

World Copper Mine Production, 1900-2017
(thousand metric tonnes copper)
Source: ICSG

Since 1900, when world production was less than 500 thousand tonnes copper, world copper mine production has grown by 3.2% per annum to 20 million tonnes in 2017. SX-EW production, virtually non-existent before the 1960s, stood at 3.7 million tonnes in 2017.



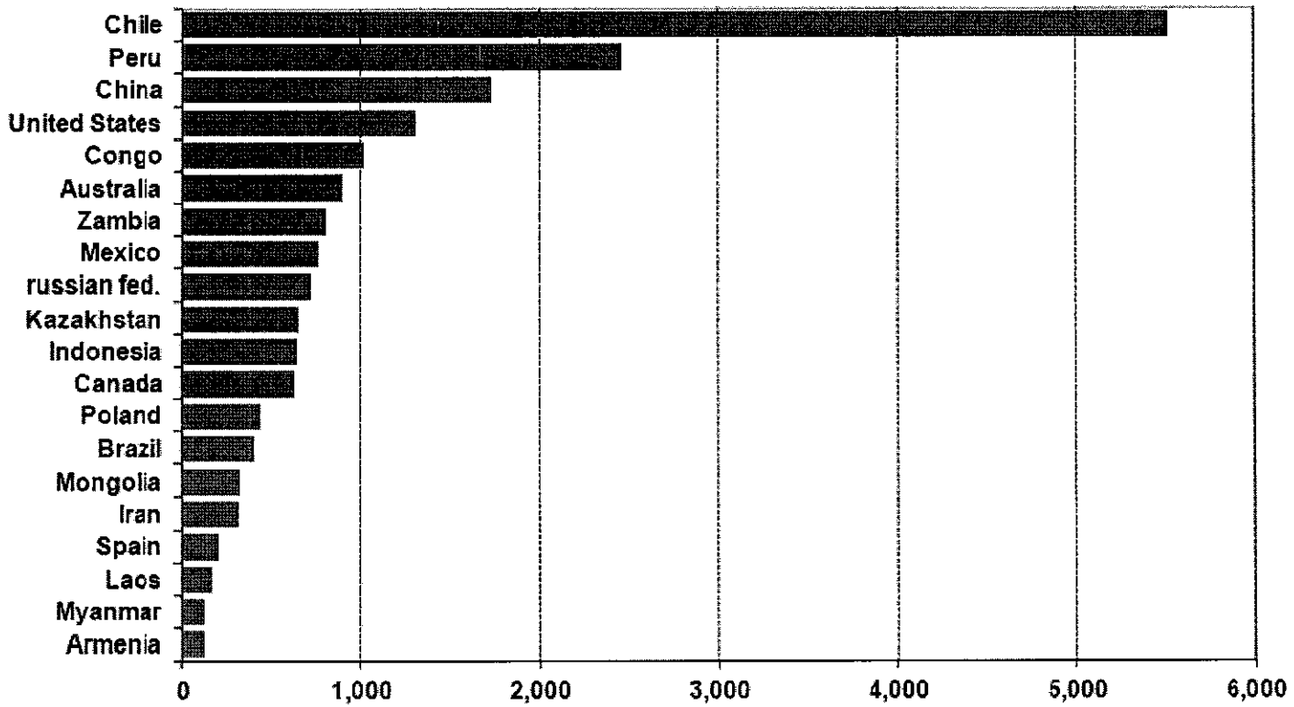
3179

ANNEXURE-3(a)

Copper Mine Production by Region, 1960 versus 2017

Thousand metric tonnes copper

Source: ICSG



From less than 750,000 tonnes copper in 1960, copper mine production in Latin America has increased to 8.4 million tonnes in 2017, representing 42% of the global total. Asia has also exhibited significant growth. The region's share of global production has increased from just 6% to 17% over the respective period. Conversely, North America's share declined from 36% to 13%.

ANNEXURE-3(a)

The World Copper Factbook 2018

Copper Mine Production by Country: Top 20 Countries in 2017

(Thousand metric tonnes)
Source: ICSG

Chile accounted for over a quarter of world copper mine production in 2017 with mine output of 5.5 million tonnes copper. Peru, which has seen a sharp increase in output since 2015, accounted for 12% of world mine production.

ANNEXURE-3(a)

Trends in Copper Mining Capacity, 2000-2021

Thousand metric tonnes (Bars) and Annual percentage change (Line)
Source: ICSG Directory of Copper Mines and Plants – H1 2018 Edition

Copper mining capacity is estimated to reach 25.9 million tonnes copper in 2021, with 20% being SX-EW production. This will be 8% higher than global capacity of 23.9 million tonnes copper recorded in 2017. Growth in copper mine capacity is expected to average 2.4% per year going forward as new capacity is added at existing and some new operations. The ratio between production and capacity is called the capacity utilization rate. The world mine capacity utilization rate was around 84% in 2017.

Note: Capacity data reflects production capabilities not necessarily production forecasts

Judges Bungalow Road,
Bodakdev, Ahmedabad – 380 015;
Gujarat, India

Dear Mr. Rao / Mr. Prasanna,

Expression of Interest for Supply of Copper Concentrate

This refers to various discussions we have had over last one year.

We are happy to note that the project is now well into the final phase of getting approvals.

As you are aware, we are a part of Mitsubishi Group which has investments in copper mines like Escondida, Los Pelambres, Antamina, Quelleveco etc in Latin America. The Group also owns Triland Metals Ltd – a prominent member of London Metals Exchange.

We are currently trading approximately 600K dmt copper concentrate worldwide and with Quelleveco offtake commencing from early 2022 onwards, the book size will increase to well over 1 million dmt. We have access to some of the cleanest copper concentrate qualities available.

As assured during our meetings, Mitsubishi Corporation RtM International Pte Ltd (RtMI) shall be more than pleased to supply mutually agreed quantity of copper concentrate to the proposed Adani Copper smelter.

Looking forward to discuss in greater detail once all the approvals are in the place.

Kindly keep us posted on the progress. Thanks

Best regards,

Y.K. Sharma
Mitsubishi Corporation
RtM International Pte Ltd.

TRANSAMINE
TRADING SA

Date : Feb 01 , 2019

M/s Adani Enterprises
Ahmedabad

Kind Attention : Mr Prasad Surya Rao

Dear Sir

This is with reference to our various discussions on the subject of Copper concentrates supplies to your proposed Copper Smelter project at Mundra.As you are aware Transamine Trading SA, trades 1.2 to 1.5 million MT of copper concentrates annually, sourcing the same across the globe from as far and wide as Chile, Peru, Mexico, US, Canada, DRC, Indonesia, Papua New Guinea, Australia etc. It has got well established relationship with all the major mines like Escondida, Grasberg, Los Pelambras, Chiquicamata, Andina, Collahuasi, Sierra Gorda, Jabel Sayid etc. It expects to maintain the volume for the coming years at the present level, which makes it one amongst the top four Copper concentrates trader in the world today.

Kindly note Transamine Trading S.A, Geneva has advised that they will be extremely keen into entering into an agreement for long term supply of Copper concentrates under frame mechanism covering multiple years, as we have discussed so far . The said agreement can be sealed and signed off, once the proposed project gets necessary Environment Clearance to establish from the relevant regulatory authorities. Therefore , please do advise us once you have received the mentioned approval – so that we can progress on the agreement.

We look forward to hearing from you soon

Thanks and Regards
Somnath Ghosh
On behalf o Transamine Trading S.A.

TRAFIGURA

TRAFIGURA INDIA PRIVATE LIMITED

11th February 2019

To,

Adani Enterprises Ltd.- Copper Business
Adani Corporate House, Shantigram,
Nr. Vaishnodevi Circle, SG Highway,
Ahmedabad – 380058, Gujarat, India

Sub: Supply of Copper Concentrate for Adani Copper Project

Kind Attention: Mr. Prasad A. Suryarao

This is with reference to the update on the progress of your Copper project at Mundra, Gujarat.

As you are aware, Trafigura is one of the largest copper concentrate suppliers in the world and have association with multiple miners and Smelters all across the world. We are delighted to reconfirm building a long term relationship with Adani for this project. We confirm our interest to be a Concentrate supplier to your Project – depending on the time frame for the project commissioning, commercial and other related terms. The said supply would be made on a regular basis from our pool of resources available. We also assure you that the quality parameters will be shared with you on a periodical basis & based on the mutual agreement, the requisite quantity shall be supplied to your project.

At last we want to reassure you that we would be definitely be interested to enter into the MoU/Definitive agreement for this project concentrate requirement offtake subject and as confirmed by you after necessary statutory approvals and other formalities which we understand are still going on including but not limiting to EC. The detailed terms & conditions will also be incorporated in the agreement based on our mutual discussion at that point of time.

Wishing you the best for your approval process, we look forward for your feedback on the progress.

Yours faithfully,

For Trafigura India Pvt. Ltd.

To: Adani Enterprise Ltd – Copper Business, Ahmedabad.
Dear Mr. Prasad Suryarao,

We are delighted to receive an update on the progress of your copper project at Mundra.
It is our honor that we may have a chance to establish a long-term relationship with Adani who will be a biggest copper producer in India after the completion of the smelter construction work.

As you might be aware, we are one of the major copper concentrate supplier in the world who handle approximately 1 million DMT per year of the copper concentrates.

Our major sources of supply are; Collahuasi copper mine, Los Bronces copper mine and Caserones copper mine of which we have shares, and also, we have long-term supply contracts with the global major suppliers including Codelco and BHP, as well as off-take contracts with the middle sized copper mines in Asia Pacific region.

On top of the copper concentrates, we are capable to supply the secondary copper raw materials including copper anodes and copper blisters which may be consumed at your smelter facility.

Please be advised that we are ready to discuss our business opportunity including Memorandum of Understanding arrangement for our future raw material business once necessary licenses including the environment approval have been granted by the authorities.

We do hope your operating permission to be obtained soon, looking forward to discussing our business possibility near future and waiting any further good news from yours with this regard.
Hope this is line with our earlier discussion also.

Yours faithfully,

Tatsuhiro Torikai
General Manager
Raw Material Marketing Dept.
Base Metals Div.

3190

EAC OBSERVATION NO.-4

EAC OBSERVATION:

Water consumption of 10 LTPA Copper smelter is 32790 KLD whereas the water requirement for existing 4.5 LTPA copper smelter unit is only 10,000 KLD. Hence, water requirement for the proposed plant has to be reworked out.

REPLY:

The water consumption for the proposed copper plant has been reworked and reduce to 29,839 KLD based on the information submitted by various technology licensers.

Water consumption is largely due to evaporation losses in the cooling tower of Copper Smelter and Sulphuric Acid Plant, evaporation losses during the copper slag granulation. To identify the area to rework for the water consumption reduction, a benchmarking exercise was carried out.

Water Consumption is largely depends on:

1. Type of Cooling System (Air Cooling/ Water Cooling/ Sea water or River based once through system) adopted.
2. Operating conditions (Temperature of the Incoming water and Circulation Rate) prevailing.
3. Type of Copper Slag Handling System (Granulation or Ladle Cooling)
4. Air Cooling and Ladle Cooling needs large area.

Proposed project will have water consumption ~7.51 m^3/T of Copper in case of water cooling system (6.5 m^3/T of Copper in case of air cooling system) compared to Vedanta's water consumption of ~6.9 m^3/T of Copper (average of last 5 years)*.

Specific Water Consumption (m^3/T of Product)

Name of the plant	Unit	Proposed	Vedanta, India**
Copper Smelter	m^3/T of Copper	2.49	2.40
Copper Refinery	m^3/T of Copper	0.53	0.66
Sulphuric Acid	m^3/T of Copper	4.32	2.98
CCR	m^3/T of Copper	0.17	0.24
Total Copper		**7.51**	**6.28**
Phosphoric Acid	m^3/T of Phosphoric Acid	2.79	4.33

Source: Sustainability Report

****Source: National Award for Excellence in water management – 2008***

Difference between Proposed and Vedanta:

1. Sulphuric Acid Cooling Tower system: Water Cooled CT Vs Water Cooled CT+ Radiator Type air Cooler.
2. Sulphuric Acid to Copper ratio (This ratio depends on sulphur to copper ratio in copper concentrate): **3.00** vs **2.70**

Type of Cooling Towers

Due to non-availability of adequate water, referred plant uses mix of Water Cooled Cooling Tower and Radiator Type air Cooler system for Sulphuric Acid cooling which saves approximately 0.7 m3 per ton of sulphuric acid. This has reduced water consumption by ~0.7 m3/ T of Sulphuric Acid (~2.2 m3/T of Copper). Proposed project will be using water cooling system due to availability of the water from desalination plant and it also helps to reduce carbon footprint by 45% of cooling system. Detailed note is attached (**Annexure-4(a)**) for the ready reference.

Benchmarking of water consumption with some of the best Smelters in the World:

Aurubis – Germany: Aurubis Copper Plant in Hamburg – Germany; uses ~99% water required for the plant operations from the nearby River and discharges the water back in the river. Details for the last 3 years (**Annexure-4(b) & 4(C)**) are provided as below:

Description	FY 2017	FY 2016	FY 2015
Copper Production (Tons)	455,406	450,400	443,185
Water Consumption m^3/T of Cu	6	7	5

Source: Aurubis AG Environmental Statement 2016 & 2017

3192

ANNEXURE-4(a)

MUNDRA COPPER SMELTER – 1.0 MTPA
COMPARISON OF WET COOLING TOWER AND RADIATOR TYPE AIR COOLER

- **Preamble**

Sulphuric acid plant requires circulating water for meeting cooling requirement of various auxiliaries. Heat from various auxiliaries is gained by circulating water which is rejected to the atmosphere through cooling tower.

The heat can be rejected from the circulating cooling water either through wet cooling tower or dry cooling tower (i.e., radiator type air cooler, which is water to air cooler).

Wet cooling towers (or open circuit cooling towers) operate on the principle of evaporative cooling. The cooling water from the plant is pumped to a height of about 10 m and distributed over the cooling tower fill, cascading down the fill to the well at the bottom. In this type of cooling tower, some water is lost due to evaporation and drift which is about 2% of circulation rate. Also, in order to keep the dissolved solids in water under control, blowdown is taken from the water. To make-up for this loss (~2.5%), water needs to be continuously added into the system.

Radiator type Air Coolers (or Dry cooling towers) work on the principle of convection and conduction to dissipate heat from process fluid to the air stream created by the fans mounted on it. Dry coolers are closed loop systems which eliminate any kind of water loss and thus eliminating the continuous requirement of make-up water.

A comparative study is done with respect to the wet and dry cooling towers for the sulphuric acid plant for Mundra Copper Complex and same is presented below in this note.

1 Technical Comparison

Technical comparison of different parameters between Wet Cooling Tower and Radiator type Air Coolers are presented in the table below considering the circulating water requirement for a 1500 KTPA (100% H_2SO_4) of sulphuric acid plant for each phase.

S.No.	Description	Unit	Wet Cooling Tower	Radiator type Cooler
1	Heat Load	kW	172138	172138
2	Hot Water Inlet Temp	deg. C	42	80
3	Cold Water Outlet Temp	deg. C	32	65
4	Water Quality	-	Desalinated Water	Passivated DM
5	Total Circulating Water	m^3/hr	14804	9869
6	Temperature Range	deg. C	10	15
7	Cycles of Concentration, C		4	0
8	CT evaporation loss, E	m^3/hr	227	0
9	Total CT evaporation loss per day	m^3/day	5436	0
10	CT drift loss @ 0.01% (D) of total CW flow	m^3/hr	1	0
11	Total CT drift loss per day	m^3/day	36	0
12	CT blow down (B) B = (E / C-1) -D, where C = Cycles of Concentration,	m^3/hr	74	0
13	Total CT blow down per day	m^3/day	1776	0

MUNDRA COPPER SMELTER – 1.0 MTPA

COMPARISON OF WET COOLING TOWER AND RADIATOR TYPE AIR COOLER

S.No.	Description	Unit	Wet Cooling Tower	Radiator type Cooler
14	CT make-up total (M) M = E* (C /(C-1))	m^3/hr	302	0
15	Total CT make up water required per day for each phase (1500 KTPA SAP)	m^3/day	7248	0
16	**Total CT make up water required per day for both phase (3000 KTPA SAP)**	**m^3/day**	**14496**	**0**
17	Power Consumption to produce desal water	kW	1359	0
18	Power Consumption Fans	kW	539	4370
19	Power Consumption for CW Pumps	kW	2069	1379
20	Total Power Consumption for each phase (1500 KTPA SAP)	kW	3966	5749
21	Total Power Consumption for both phase (3000 KTPA SAP)	**kW**	**7933**	**11498**
22	Footprint each phase (1500 KTPA SAP)	m2	935	4186
23	**Footprint each phase (1500 KTPA SAP)**	**acre**	**0.231**	**1.034**
24	**Footprint both phase (3000 KTPA SAP)**	**acre**	**0.462**	**2.069**
25	**CO2 Emission each phase (1500 KTPA SAP)**	**kg**	**1123**	**1627**
26	**CO2 Emission both phase (3000 KTPA SAP)**	**kg**	**2245**	**3255**

1.1 Circulating Water Quality

For Wet cooling tower, desalinated water will be used as circulating water in the circuit.

For radiator type cooler, the circulation system is a closed one, therefore passivated DM water shall be used with provision for intermittent make-up.

1.2 Water Consumption

As per above table, make-up water requirement for wet cooling towers of both phases is approx. 14496 m3/hr to account for blowdown, evaporation and drift losses.

In radiator type air coolers, the water circulates in closed loop, hence make-up water requirement is not there (negligible, as only leakages have to be topped-up).

1.3 Power Consumption

In both the systems, fans and pumps consume power. However, in case of wet cooling tower, additional power will be consumed for generating make-up water.
As indicated in table above, total power consumed by radiator type coolers is 45% higher than wet cooling tower.

ANNEXURE-4(a)

3194

MUNDRA COPPER SMELTER – 1.0 MTPA
COMPARISON OF WET COOLING TOWER AND RADIATOR TYPE AIR COOLER

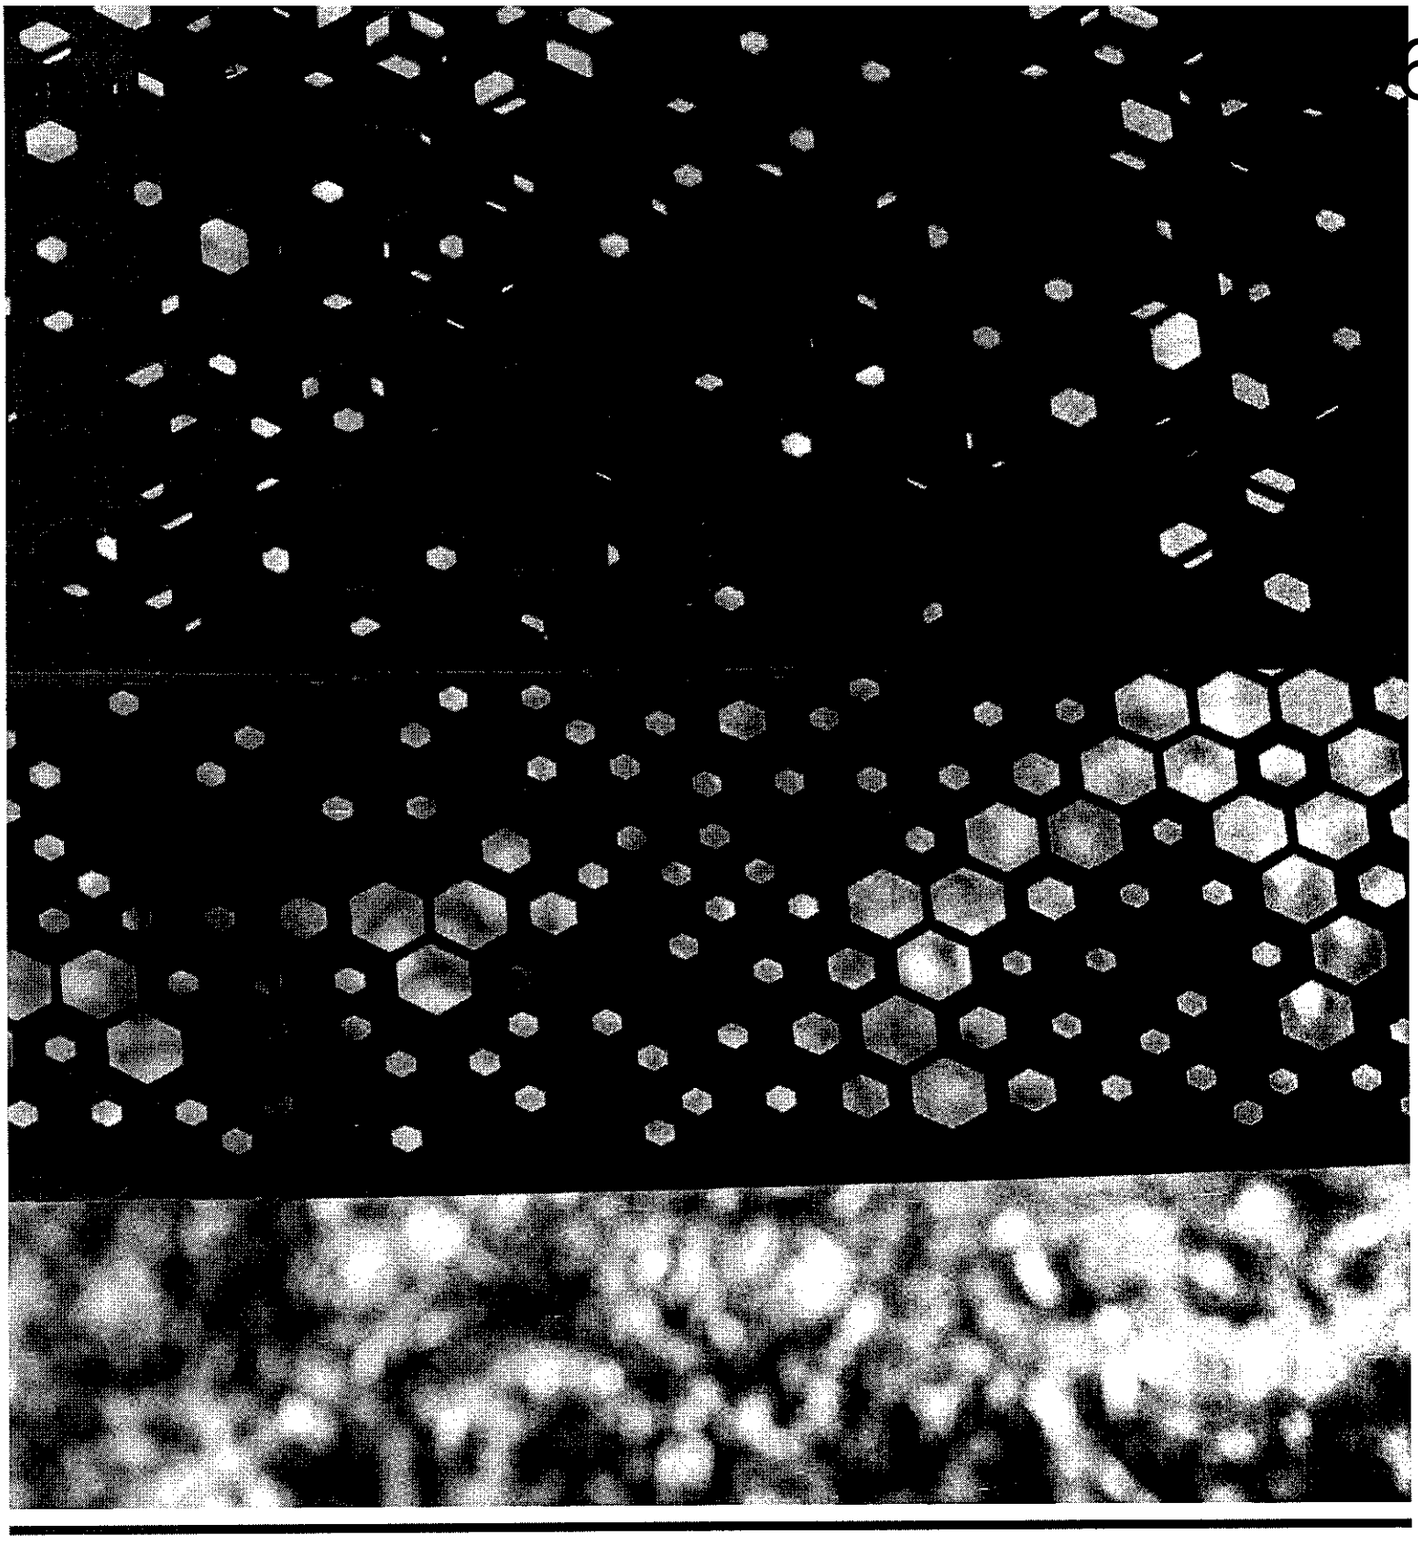
1.4 Footprint Area

Footprint area required for radiator type cooler will be approx. five (5) times that of wet cooling towers for same flow of circulating water.

1.5 Carbon Emissions

As per above table, there is significant difference in carbon emission (45% higher) for radiator type cooler compared to wet cooling tower.
(Note: Based on Greenhouse gas reporting: conversion factors from Department for Business, Energy and Industrial Strategy, Govt of UK. The conversion factor is 0.28307 kg CO2 for each kWh produced.)

1.6 Material of Construction



FRP can be used for cooling tower casing and PP/ PVC materials can be used in wet cooling tower for fills & drift eliminators.

Radiator type cooler casing/ structure shall be carbon steel with epoxy painting and finned tubes shall be of Stainless steel.

2 Conclusion

Wet cooling tower is recommended due to the following as detailed above:
1) Lower power consumption 45%
2) Lower carbon footprint by 45%
3) Lower land requirement by 77%
4) No need of DM water
5) Reliable performance as no issues of fouling being an open system

EAC OBSERVATION:

According to the EIA records, Dhaneshwari River is passing through the project site and the mangrove reserve forest is existing within the project site. Quantification of these mangroves and conservation measures for mangroves and the river stream has not been submitted.

REPLY:

As mentioned in EIA report, Dhaneshwari River is passing through the project site. However, no mangrove reserve forest is existing within the project site. The mangroves are present at Kotdi creek which is about 200 m from the project site in the southern side. Flow of the water from the river will not be disturbed. There will be bridges across the two land parcels for accessing. No activity will be carried out in Dhaneshwari river bed. A 50 m wide greenbelt has been proposed along the side of Dhaneshwari River within the project site. In addition, further provision of 50 m (total 100 m along the river side) has been proposed wherever solid waste storages are proposed.

Wildlife Conservation Plan & Mangrove Conservation Plan study including quantification of the Mangroves (Area under mangroves is 1,251.74 ha in the study area) for the proposed greenfield copper refinery project has been prepared. Mangroves in the study area has been quantified based on the geo-reference mapping of mangroves done for entire SEZ area by National Centre for Sustainable Coastal Management (NCSCM), Chennai.

Wildlife Conservation Plan & Mangrove Conservation Plan has been submitted to Divisional Forest Officer (Kutch- East) and it is forwarded by DFO to CCF. CCF has further forwarded the Conservation Plan to Chief Wildlife Warden (CWLW) of the state, for approval process

A study carried out by National Centre for Sustainable Coastal Management (NCSCM), Chennai in year 2018, the total mangrove cover in Kotdi-I and Kotdi-II creeks was about 410 ha, out of which dense mangroves occurred to the extent of only 50 ha (12%), followed by sparse mangroves, distributed in 189 ha. The scattered mangrove covered an area of 171 ha. A study by Thivakaran and Sawale (2016) reported 47 species of macrofauna in the Mundra mangrove eco-system. Total 12 species of gastropods, 14 species of crustaceans, 9 species of bivalves, 8 species of polychaetes and 4 species belonged to the category "others". Increasing spread of mangrove area and high species richness of macrofauna suggests healthy and dynamic condition of mangrove ecosystem in this area. Study suggests that mangrove plantation shall be carried out by Kutch East Forest Division as the area is under their jurisdiction and the staff has vast experience in mangrove plantation and management. A financial outlay of Rs. 250 Lakhs has been proposed by AEL for mangrove plantation and monitoring. The mangrove conservation report is enclosed as **Annexure-5**.

3202

EAC OBSERVATION NO.-5

SAMPLING LOCATIONS FOR FLORA AND FAUNA STUDY IN THE BUFFER AREA

SAMPLING LOCATIONS FOR FLORA AND FAUNA STUDY IN THE CORE AREA

Conservation Measures for Mangroves:

a) A tall wall around the project boundary will be constructed so that dusting is controlled during construction and operation phases.
b) Thick green belt around the project boundary will be created so that fugitive particulate matters are arrested.
c) Dust pollution control measures will be implemented at various generating point sources in the plant areas.
d) Water pollution control measures will be in place including treating industrial effluents containing heavy metals.
e) The plant will operate on Zero Liquid Discharge (ZLD) principle.

Further,

a) Mangrove plantation is planned on the bank of Kotdi-I, Kotdi-II and Baradimata creek systems.
b) Total 50 ha of plantation every year will be taken-up for 10 years period for which budget and action plan has been proposed in wildlife and mangrove conservation plan developed in consultation with DFO Kutch East.
c) The financial allocation for Mangroves protection measures is about Rs. 250 lakhs.

To,

Deputy Conservator of Forest
Kutch East Forest Division,
Bhuj, Gujarat

Sub: Submission of Wildlife and Mangrove Conservation Plan Approval please.

Ref:

1) Letter no- No. A/ JMN/ T.9/ 91/ 2018-19 of you good office dated 04.05.2019.
2) Chief Conservator of Forest, Kutch Forest Division, Bhuj- Kutch vide letter no- A/ JMN/ T.12/ 501 dated 11.04.2019

Kind Attn: Sh. P A Vihol

Dear Sir,

With reference to the above referred letter, we are submitting the revised report after incorporating the following as desired by you:

In Principle Approval (Stage-IV) granted by MoEFCC to M/s APSEZ is incorporated in Annexure No-1 of Wildlife and Mangrove Conservation Plan attached herewith in 4 copies.

Map indicating distance of proposed area from the Sanctuary, Eco-Sensitive Zones as well as Kutch Biosphere Reserve and nearby wetlands is incorporated in Annexure No-3 of Wildlife and Mangrove Conservation Plan attached herewith in 4 copies.

The Stage-1 Forest Clearance has been obtained by the M/s APSEZ for 1576.81 Ha Forest Land in various patches. M/s APSEZ is under obligation to comply with all conditions of this Forest Clearance to secure Stage-2 clearance.

Copper project is proposed by separate company "M/s AEL" for which land shall be provided by M/s APSEZ as a clear land after all clearance. M/s AEL has obtained the TOR from MoEFCC for EIA of Copper Project and this Wildlife and Mangrove Conservation Plan is being prepared Condition No 5 (v) of the TOR received by M/s AEL. This conservation plan scope is to identify Schedule-I Fauna if any exist in the study area (10Km radius) and identify if may get impacted by the proposed copper project and prepare conservation plan for the same.

Proposed Copper project boundary does not fall inside any protected area or any ESZ of any protected area and no forest diversion is applied by M/s AEL for the proposed copper project. There is guideline for wildlife conservation plan budget on the basis of percentage of total project cost only in case a project involves diversion of forest land in protected area which is not the case for Copper project of M/s AEL.

Hence, the conservation cost for wildlife and the mangroves for proposed Copper project has been arrived on the basis of scientific study and estimate for Schedule—I species in the study area (10 Km radius of copper project). Total Rs 443.5 Lakhs has been proposed as budget for conservation activities. Total project cost shall be Rs 10,000 Cr.

Hope you will find this report and map suffice the requirement and satisfactory. For your kind perusal and forwarding to Chief Wildlife Warden (CWLW) for approval please.

Thanking you,
For, Adani Enterprises Limited,

(Santosh Kumar Singh)

1. INTRODUCTION

1.1. Background

M/s. Adani Enterprises Limited (AEL) intends to set up a Greenfield copper refinery project of 1.0 MTPA (10 LTPA) capacity in 256.58 ha (634 acres) of area, which includes facilities like copper smelter, sulphuric acid plant, copper refinery, continuous cast copper wire rod plant, precious metal recovery plant, phosphoric acid plant, aluminium fluoride plant, effluent treatment plant, utilities storage of water and fuel, etc. with the state of the art environment friendly technology, which will be located at Adani Port Special Economic Zone (APSEZ) land in villages Siracha and Navinal, Taluka Mundra, district Kutch, Gujarat.

As per Environmental Impact Assessment (EIA) Notification dated 14th September 2006, proposed project falls under category-'A' of project activity 3(a) and requires prior Environmental Clearance (EC) to be obtained from Ministry of Environment, Forest & Climate Change (MoEF&CC) before the commencement of ground activity. The application No: IA/GJ/IND/53004/2016 for prior EC (Form-1 and Pre Feasibility Report) for the proposed project has been submitted to MoEF&CC on 21st April 2016 and same was reviewed by the Expert Appraisal Committee (Industry-I) the meeting held on 4th May 2016 in New Delhi to prescribe Terms of Reference (TORs) for the preparation of EIA/EMP report. TOR has been issued by MoEF&CC vide letter reference F.No.J-11011/113/2016-IA.II(I) dated 21st June 2016 (Annexure-I). EIA for the project has been conducted by the NABET accredited consultant and submitted to MoEF&CC for Environmental Clearance in 2018.

As a part of approved ToR No. 5(v) 'Wildlife Conservation Plan duly authenticated by the Chief Wildlife Warden of the State Government for conservation of Schedule I fauna, if any exists in the study area is to be prepared'. Present study is carried out towards preparation of above mentioned plan based on primary data and field surveys. Besides, as on voluntary basis, the Mangrove Conservation Plan has also been

incorporated in this report. Therefore, the present study is carried out to fulfil requirement of the Term of Reference (ToR).The present study is a detailed account of flora, fauna, mangrove and wildlife habitats present in 10 km radius of the proposed project area based on literature survey and primary data collection. Additionally 10-15 km radius area was also studied to check if there is any environmental sensitivity present based on the secondary information and published literature.

1.2. Legal Framework

M/s. Adani Enterprises Limited (AEL) intends to set up a Greenfield copper refinery project of 1.0 MTPA (10 LTPA) capacity in 256.58 ha (634 acres) of area, which includes facilities like copper smelter, sulphuric acid plant, copper refinery, continuous cast copper wire rod plant, precious metal recovery plant, phosphoric acid plant, aluminium fluoride plant, effluent treatment plant, utilities storage of water and fuel, etc. with the state of the art environment friendly technology, which will be located at Adani Port Special Economic Zone (APSEZ) land in villages Siracha and Navinal, Taluka Mundra, district Kutch, Gujarat.

The proposed project falls under category-'A' of project activity 3(a) and requires prior Environmental Clearance (EC) to be obtained from Ministry of Environment, Forest & Climate Change (MoEF&CC) before the commencement of ground activity. The application No: IA/GJ/IND/53004/2016 for prior EC (Form-1 and Pre Feasibility Report) for the proposed project has been submitted to MoEF&CC on 21st April 2016 and same was reviewed by the Expert Appraisal Committee (Industry-I) the meeting held on 4th May 2016 in New Delhi to prescribe Terms of Reference (TORs) for the preparation of EIA/EMP report. TOR has been issued by MoEF&CC vide letter reference F.No.J-11011/113/2016-IA.II(I) dated 21st June 2016. The present study is to fulfil the requirements of studies mentioned under ToR No. 5(v) issued to AEL.

1.3. Scope of Work

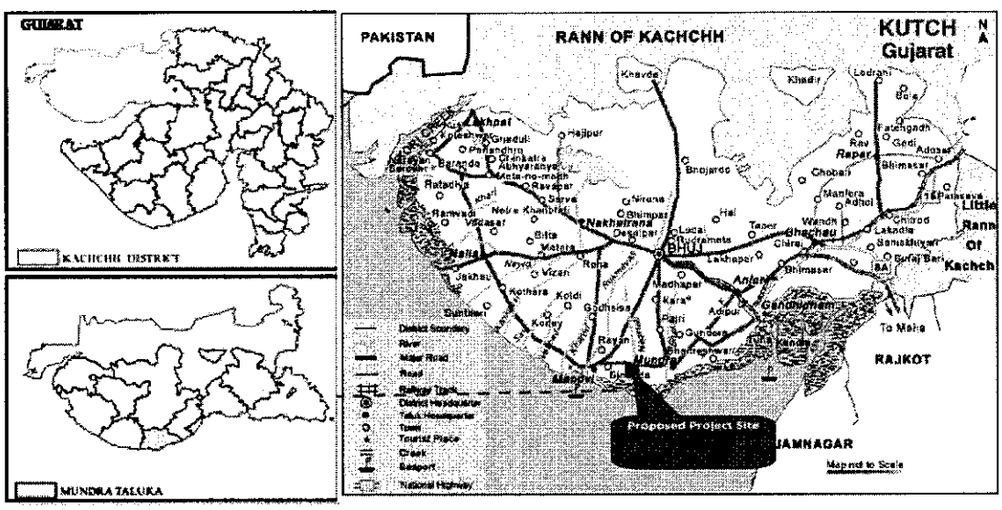
Scope of work for this study is in line with the ToR No. 5(v) issued to AEL which include preparation of Wildlife Conservation Plan and Mangrove conservation plan as part of this report. The preparation of the wildlife and mangrove consecration plan required the study of habitat types and quality, species, diversity, rarity, fragmentation, ecological linkage, age, abundance, etc. in case of schedule fauna, conservation measures should be proposed, And a detailed study to assess the wildlife habitats, their migration route, etc. and measures to mitigate impacts of the proposed activities.

The present study has carried out identification of ecologically sensitive receptors (species, habitats& eco-systems) based on field investigations and literature survey along with their mitigation with conservation action plan. The study was carried out in core area (project site) and in buffer area i.e. 10.0 km periphery from the project site. The study was carried out systematically and scientifically using primary and secondary data in order to bring out factual information on the ecological conditions of the project site and its surroundings.

The study involved assessment of general habitat type, vegetation pattern, preparation of inventory flora and fauna of terrestrial ecosystem in 10 km radius from the boundary of proposed project site. Biological assessment of the site was done to identify whether there are any Rare, Endemic or Threatened (RET) species of flora or fauna in the core area as well its buffer zone and to identify whether there are any ecologically sensitive area within buffer zone that is likely to be impacted. The study also designed to suggest suitable mitigation measures if necessary for conservation of important species and their habitats etc.

1.4. Objectives of the Study

The major aim of the present study is to avoid any impact of proposed project activity on important natural habitats or species in the study area. Therefore, the study is carried out with following objectives.



- To evaluate the ecological status of the study area with respect to important flora, fauna and ecologically sensitive habitats etc.
- Assessment of any impacts of the project activities on ecologically sensitive habitats and species.
- Recommend mitigation measures in the form of wildlife conservation plan with an in-built monitoring mechanism and schedule of implementation along with financial budget.

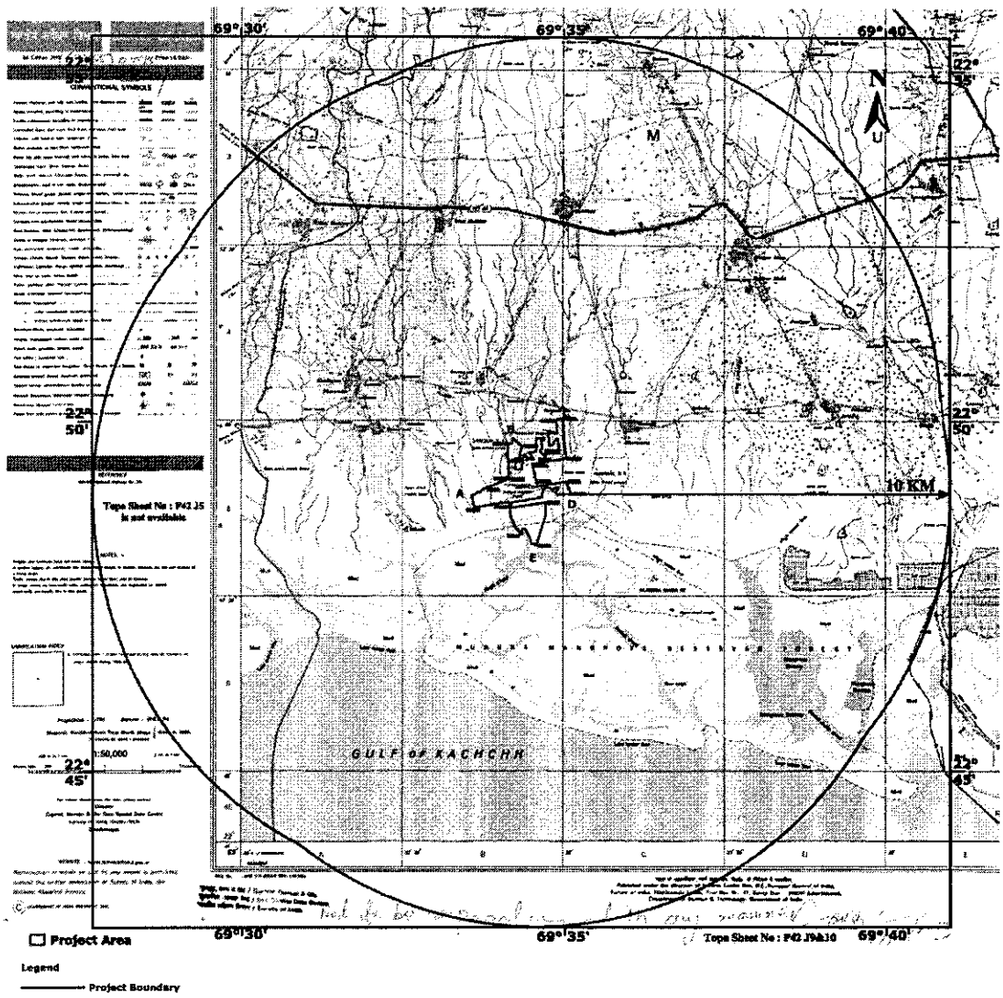
2. STUDY AREA

2.1. Project Location

The proposed project site is located in villages Siracha and Navinal at APSEZ Taluka Mundra, district Kutch in the state of Gujarat (Map-2.1).

Map- 2.1: Proposed project location in Siracha village of Kutch district in Gujarat.

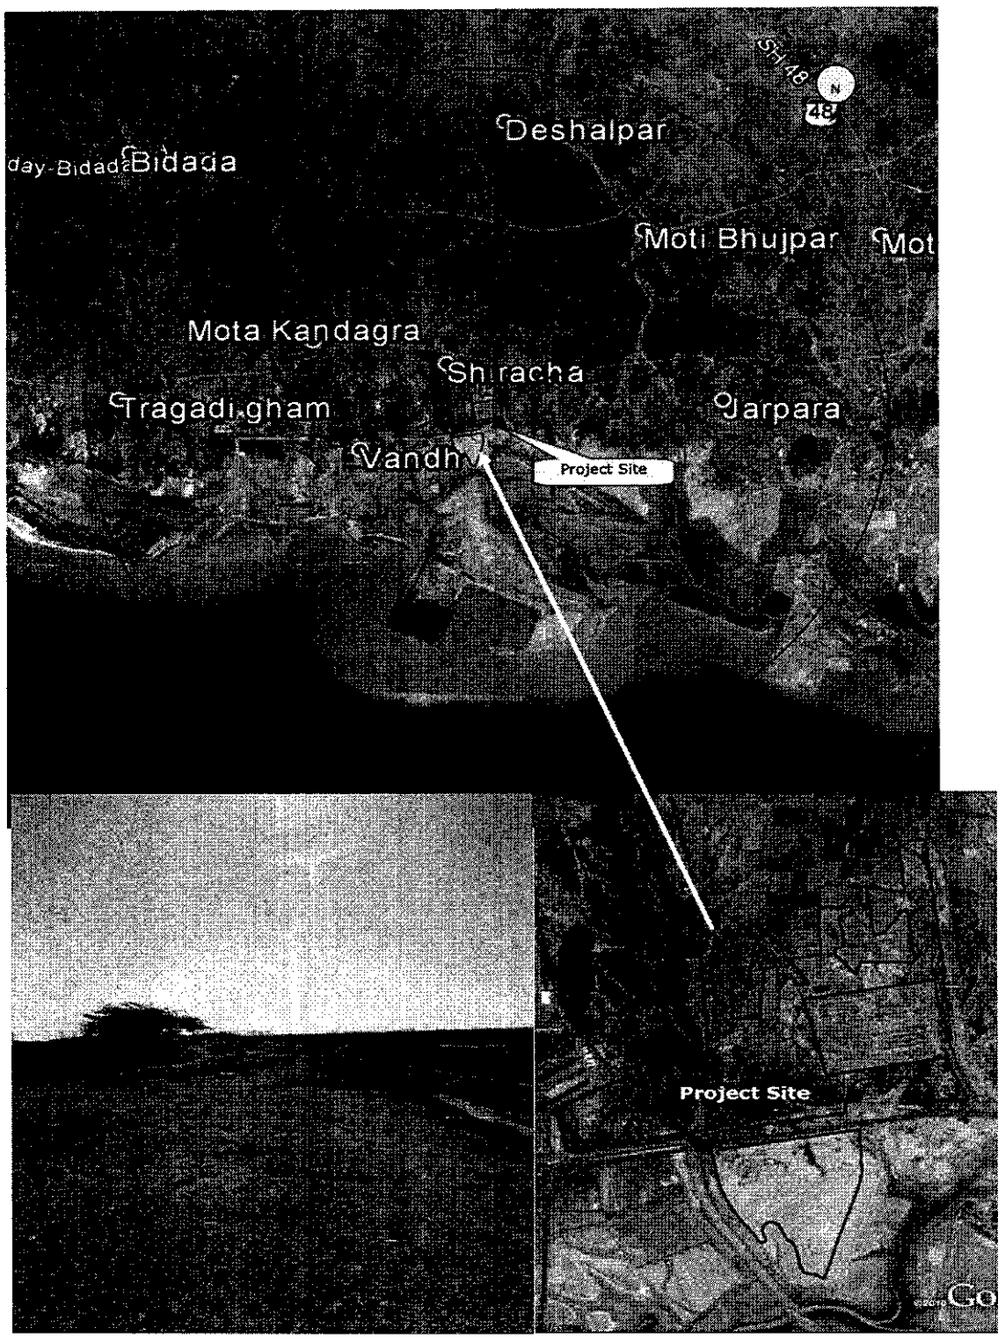
2.2. Study Area:



For the convenience of the study and the user agencies, the study area was divided in two major parts i.e. 1) Core area/project area and 2) Buffer area i.e. 10.0 km periphery of the project boundary (Map-2.3).

2.2.1. Core Area:

Core area is proposed project area of Greenfield Copper Refinery plant at Mundra (Map-2.2) The total area earmarked for the proposed project is 256.58 ha (634 acres), in which 154.19 ha (381 acres) of land belongs to APSEZ area and 102.39 ha (253 acres) of land belongs to forest area for promoting industrial development. The Gulf of Kutch sea coast is located at 3.9 km south from the proposed project site. The area is located 5.0 km south of National Highway NH- 8A and 0.3 km from State Highway SH-6. No



major vegetation or any human settlements present in the core area, therefore, there is no need for rehabilitation of any human settlements from the project site. Most importantly the project site does not fall in 10.0 km periphery of any National Park or Sanctuary or their eco-sensitive zones. Site is located outside the Coastal Regulatory Zone areas of Gulf of Kutch sea coast therefore, does not attract CRZ clearance.

Map-2.2: Proposed project location on Toposheet.

Corner Point	Latitude	Longitude
A	22°48'55.40"N	69°33'34.74"E
B	22°49'44.92"N	69°34'13.74"E
C	22°50'01.88"N	69°34'59.78"E
D	22°48'57.23"N	69°35'08.42"E
E	22°48'13.26"N	69°34'35.43"E

Map-2.3: Project location (core area) with 10.0 km buffer (study area) in Gujarat

2.2.2. Buffer Area

The buffer area mainly consists of revenue areas 18 villages that fall in 10.0 km periphery of the project site (Map-2.2). The list of villages is given in Table-2.1.

Table-2.1: List of villages falling in 10 km buffer area.

No	Village	No	Village	No	Village
1	Tunda	7	Mota Bhadiya	13	Khakhar Moti
2	Shiracha	8	Kandagara Mota	14	Deshalpar
3	Navinal	9	Bhujpar Nani	15	Sukhapar
4	Jarpara	10	Bhujpar Moti	16	Nani Khakhar
5	Bidada	11	Depa	17	Gelda
6	Tragadi	12	Nana Bhadiya	18	Dhrab

Majority of the land of the buffer area is occupied by the agriculture fields, forest area, industries (Saltpans, Ports, and Power plants), open scrub vegetation, mangrove, mudflats, pond/ reservoir, roads & railway network & built up areas etc. Most importantly there are no Wildlife Sanctuaries or National Parks located in the 10.0 Km periphery of the proposed project area. The proposed project land is located outside the Coastal Regulatory Zone of Gulf of Kutch coast.

3. METHODOLOGY

3.1. Basic frame work of data collection

The prediction of impacts of industries on flora and fauna depends on understanding of the proposed activities, its magnitude/extent, scale and ecological conditions in the surrounding area. Collection of comprehensive baseline information on flora and fauna is therefore a prerequisite for assessment of impacts of development activities. It would also help in advance planning and mitigate the impacts and ultimately managing the natural habitats and resources. The approach to achieve the stated objectives within defined scope of work, include field surveys, interviews, and reviews of literature. Following was the basic fame work of the data collection and analysis for the present study.

3.2. Field Surveys

Several field visits were carried out between month of February-March 2019 and September 2019 to understand and assess the impacts of proposed project activities on flora and fauna and natural habitats. We evaluated the distribution and abundance of flora and fauna and mangroves in project area and in buffer area separately.

3.3. Identification of Important Ecological Habitats

The important ecological habitats and features were identified based on our field visits and also mapping of landuse types in the study area. We identified ecologically important habitats through primary survey, literature survey and consulting local naturalists etc. These important ecological habitats and features were then identified on landuse map that is prepared for the study area. Land use map of 10 km radius of the proposed project site is prepared by Vimta Labs Limited is used for the present study. Prominent landuse features such as, roads, rivers/waterbody/drainages, agriculture, sea, sandy beach, mangrove, mudflats, industrial and built up areas, forest area, scrubland etc. were digitized using open source software such as QGIS and their areas were calculated. There may be acceptable

margin of errors in the final map however, locations and important features are identified and shown on map.

3.4. Study of Flora

In order to study the flora we laid 10X10 m^2 size 37 quadrates in buffer and 10 quadrates in core area (Map-3.1 & 3.2). Quadrates were laid separately for detailed analysis of vegetation in the core area (project site area) and buffer areas (10 km periphery). In order to study herbs and grass species, we laid a 1X1m^2 quadrate within the above mentioned quadrates. Details of Geographic Coordinates of each of the quadrates laid are given in Map-3.1 and Annexure-II. Information on geographic coordinate, occurrence of plants, their species names, numbers and floral phenotypes, life forms etc. were collected from each quadrate we laid. Direct visual enumeration of plant species was carried out to generate data on flora. The collected data was then systematically and scientifically analyzed to produce information on following biodiversity parameters of flora. The encountered vegetation of the study area was analyzed to calculate density, frequency & abundance (Curtis and McIntosh, 1950). Total abundance, density and frequency in respect to individual species were calculated in order to understand the vegetation structure and relative importance of the sampled areas. We used Shannon Weaver Index (Shannon & Weiner, 1949) for Species diversity and Simpson dominance index (Simpson, 1949) for species dominance. Species enumeration (inventory), richness, total abundance, density, and evenness provide systematic baseline information of the vegetation community.

3.5. Study of Fauna

We mainly studied the fauna of higher trophic levels which acts as indicator of the type and health of the environment.

Reptiles: Majority of the reptile species are fossorial in habit therefore the assessment of reptiles and their diversity etc. holds special significance for any development projects. It is difficult to conduct quantitative study on reptiles within a short period of time. Therefore, we relied on qualitative observations only. We carried out study based on interview survey,

secondary literature as well as direct observation on road killed reptiles. We randomly looked for various reptiles and their presence i.e. lizards, snakes etc. in the study areas. Therefore, only a check list of reptiles observed during the study period was prepared.

Birds: Birds, occupying higher trophic levels in the ecosystems, respond quickly to the changes in the habitats and therefore serve as one of the best indicators for evaluating the status of the area. Therefore, we created baseline data on birds by systematically and collected data on their occurrence i.e. presence absence in the buffer and core areas in the study area.

Map-3.1: Sampling locations for flora and fauna study in the core area.

Map-3.2: Sampling locations for flora and fauna study in the buffer area.

For creating baseline data on birds we randomly walked in the study area during early morning i.e. 6:00 AM to 9AM and at evening 5:00PM to 7:00 PM. These time periods of the day are when maximum bird movements are expected. We walked randomly in the study area carried out sightings of birds ad libitum and recorded species based on their identification. Special reference books for bird species identification were used. Apart from walking randomly, we also relied on specific habitat search for different species i.e. dense bushes, wetland, ponds, big trees, agriculture areas etc. In order to accomplish the inventorization of the bird species found in the study area. All the bird species are classified based on their conservation status, their schedule under Wildlife Protection Act 1972, their migratory status, habitats and their feeding guilds. This was further used for finding out important bird

species in the study area i.e. rare, endangered or species of high conservation significance.

Mammals: Like birds, mammals are also occupying higher trophic levels in many ecosystems and respond quickly to the changes in their habitats therefore, serves as best indicators of the ecosystem health. We therefore, chose to create qualitative baseline information on presence and absence of mammals in the study area. Since the presence of mammalian species is low affecting probability of their sightings, in the study area, it was difficult to estimate their population using line transect method. More importantly, it was difficult to accommodate the sightings of nocturnal and diurnal animals in the study. Therefore, we prepared a qualitative check list of mammals based on their presences and absence using indirect evidences and signs such as footprints, dens, droppings, diggings, scrap marks, etc. in the project area.

Apart from these, search efforts were also made for various signs of important wildlife species in the study area which includes looking for wildlife signs such as dens, diggings, scrap marks, droppings etc. The sites where likelihood of animals is higher such as shady trees, waterholes, dense and undisturbed bushes etc. were surveyed intensively during the survey in the study area. This survey has helped us in identifying various species of mammals in the study area. For mammal inventory, both direct sightings and indirect evidences (like dung, scats, pellets, foot prints, nests, dens etc.) were accounted.

3.6. Important Wildlife Habitats and Protected Areas

We assessed the presence and distances of important wildlife habitats and hotspots such as protected areas, mangroves, breeding and nesting habitats, coastal habitats, important wetlands, and grassland area from core area. These important areas such as Protected areas (National Park, Wildlife Sanctuaries, Conservation Reserves etc.), Wetlands of national importance, Ramsar sites, Important Bird Areas (IBAs), classified by the Bombay Natural History Society etc.

3.7. Rare, Threatened & Endemic Wildlife Species and Their Corridors

We also assessed the presence of rare, endangered, endemic and threatened wildlife creed species in the project area/core area and buffer area. Special search efforts were made during the field visits to identify any such sensitive species or their corridors etc. in the project area and buffer area. Apart from field visits we relied on interview surveys of local people, consultation with local biologists and naturalists etc.

3.8. Literature Review

Considering the time limitation to undertake statistically rigorous data gathering system, study also relied on existing knowledge about the ecology and biodiversity of the region. Importantly, there are quite a few studies undertaken in the past dealing with the impacts of copper refinery plants on flora and fauna and other concerns of biodiversity conservation. Literature on copper refinery projects and associated environmental issues were downloaded and collated through internet. Various relevant literatures were surveyed during the study for collection of baseline information. Maps, reports and documents collected from the project proponent were also reviewed and used in the present study. Books on flora, fauna and wildlife were also studied in order to understand the biology of several species. Other wildlife and mangrove conservation plans submitted for the surrounding area are also referred.

3.9. Consultations

During the study, series of consultations were made with both technical and non technical stakeholders to get precise information on the project area/core area and buffer zone habitats. In order to know more about the seasonal presence of several faunal species and their movement, study team informally consulted and discussed with local naturalists and local people, from the villages, herders and farmers who inhabit close to the proposed project area.

3.10. Supplementary Information

Other than the above, for the purpose of this study, relevant information was also collected from following sources:

Research papers on flora and fauna and mangroves

Google imageries/Google Maps

Project related Maps provided by Adani Enterprise Limited

Communications with subject experts

3.11. Analysis to Evaluate the Potential Impacts

The information collected on status of flora and fauna and, their spatio-temporal distributions, hotspots, and potential impacts of proposed project development were logically analyzed and conclusions were extracted for preparation of conservation plan for the project proponent to implement.

3.12. Preparation of Wildlife Conservation Action Plan:

After identification of key impacts of the project, on flora, fauna or any key habitats of any important species or their corridors, a comprehensive wildlife conservation action plan was prepared with monitoring mechanism and financial projections.

3.13. Limitations of the Study

The study undertaken is structured around the project information as provided by the project proponent, any change in the proposed activities may result in variation of outcome. The study is based on field visits, literature survey, consultation with local people etc. Professional judgment and subjective interpretation of facts has been applied for this study. All information's and inferences presented herein are based on the specifics currently available within the limits of the scope of work, information provided by the client or its representative, existing secondary data and schedule.

4. Ecological Assessment

The observations and assessment of overall ecological scenario presented in this chapter include details of flora, fauna, natural habitats, protected areas, wildlife species and their migration corridors etc. Such baseline information provides better understanding of the situation and overall ecological importance of the area. This baseline information viewed against proposed project activities help in predicting their impacts on the wildlife and their habitats in the region. Data collected and information gathered from secondary literature on flora, fauna, protected area, natural habitats, wildlife species etc., were analyzed and results are presented as follow.

4.1. Biogeographic Zone

The region falls in Indo-Malay Realam (IM 1303) and Deserts and Xeric Shrublands Biome as defined by WWF. The North-western Thorn Scrub Forests [IM1303] ecoregion represents a large expanse of degraded dry forest surrounding the Thar Desert. Neither exceptionally species-rich nor high in endemism, the ecoregion nevertheless harbours viable populations of antelopes.

As per classification of Indian Biogeographic zones by Rodgers et al. (2000), Kutch district falls under Biogeographic Zone 3 - the Indian Desert and the Biogeographic Province Kutch Desert- 3B.

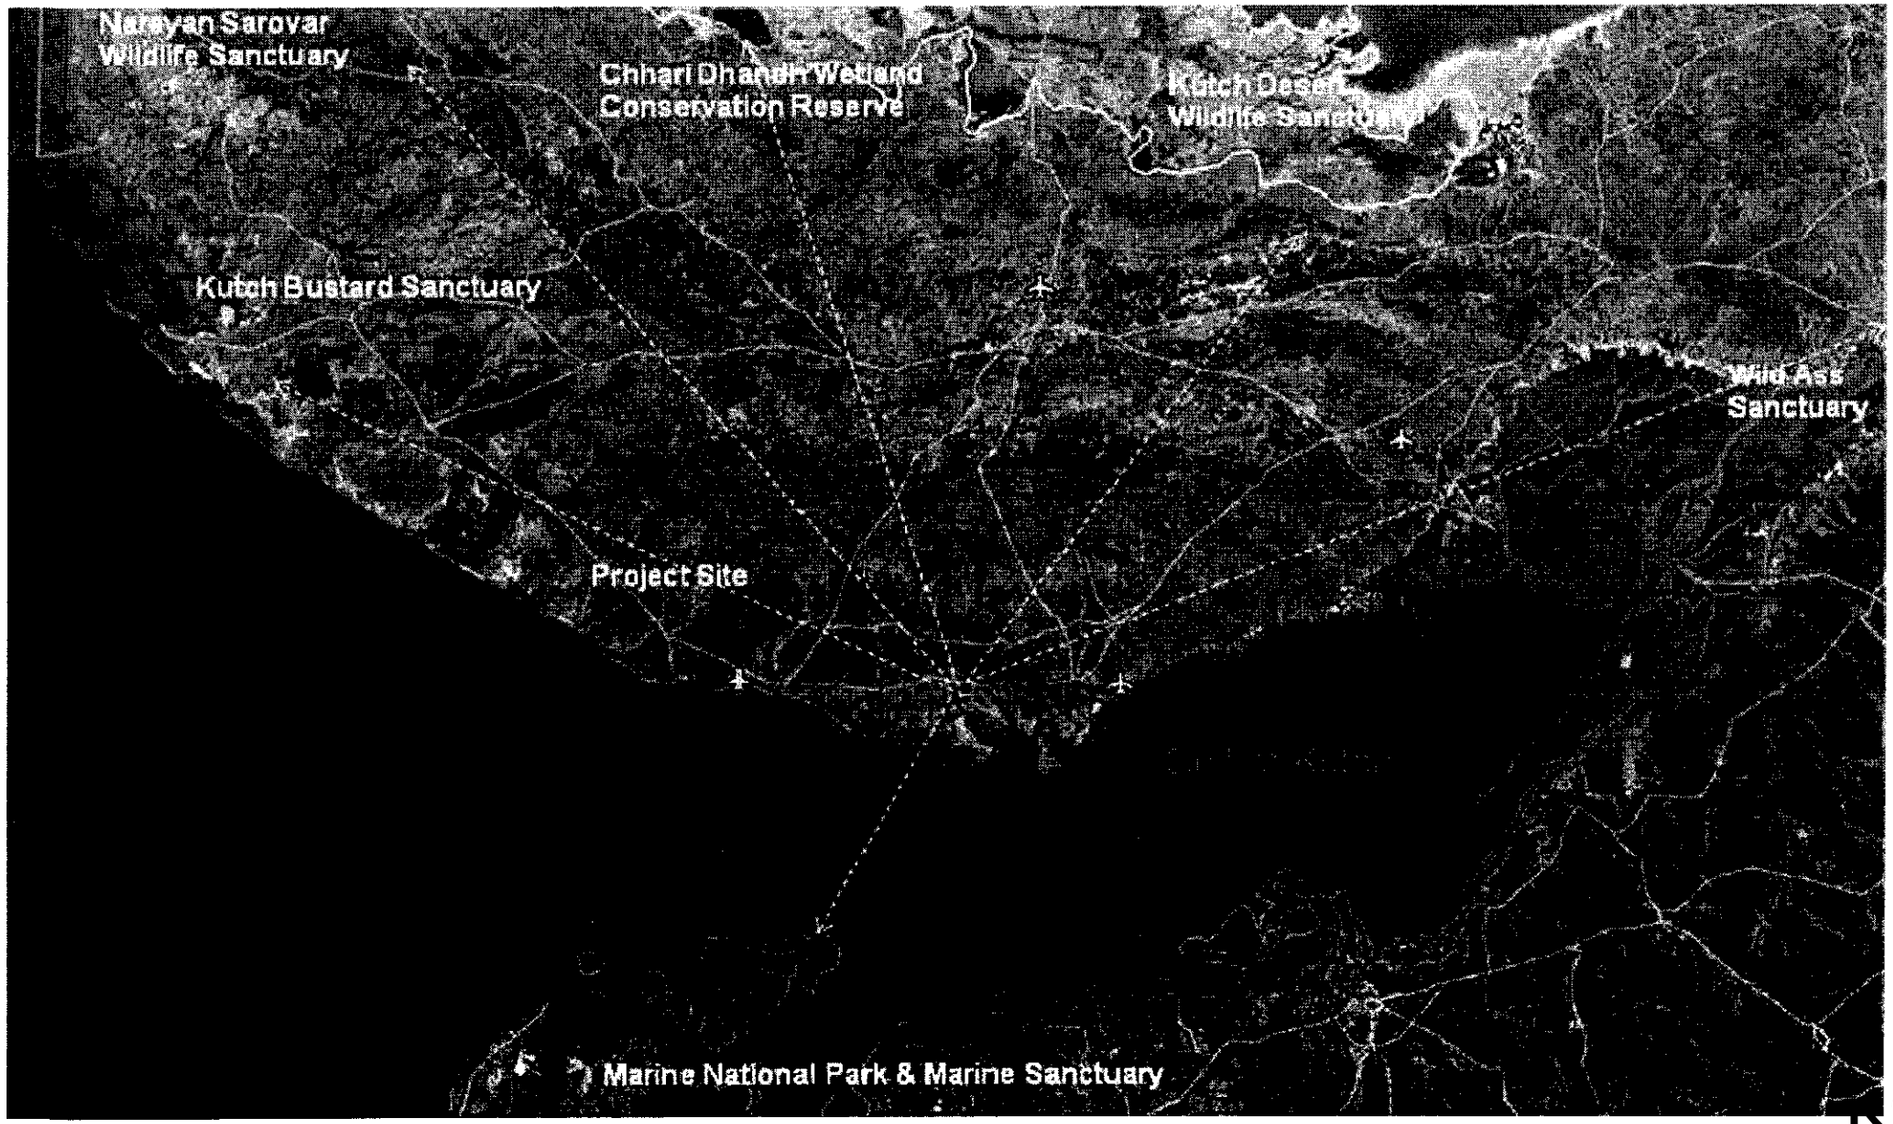
4.2. Protected Areas

As per our information and survey there is no Sanctuary, National Park, or notified wildlife corridors within the core area and buffer area (10 km) of the project site. Marine National Park is located at 33.0 km distance in south-west direction, Marine Sanctuary is located in same direction at 35.0 km distance, where as Narayan Sarovar Sanctuary is located at 103.0 km in North-West direction, Kutch Desert Wildlife Sanctuary is situated in the Great Rann of Kutch at 70.0 km North East direction. The Wild Ass Sanctuary is located in the Little Rann of Kutch at distance of 77.0 km, Kutch Bustard

Sanctuary at 92.0 km in North direction and Chari-Dhand Wetland Conservation Reserve is located at 82.0 Km north. Majority of the protected areas and their eco-sensitive zones are located beyond 30 km distance from the project site (Table-4.1, Map-4.1, Annexure-III).

Table-4.1: Protected area and their distances from proposed project site.

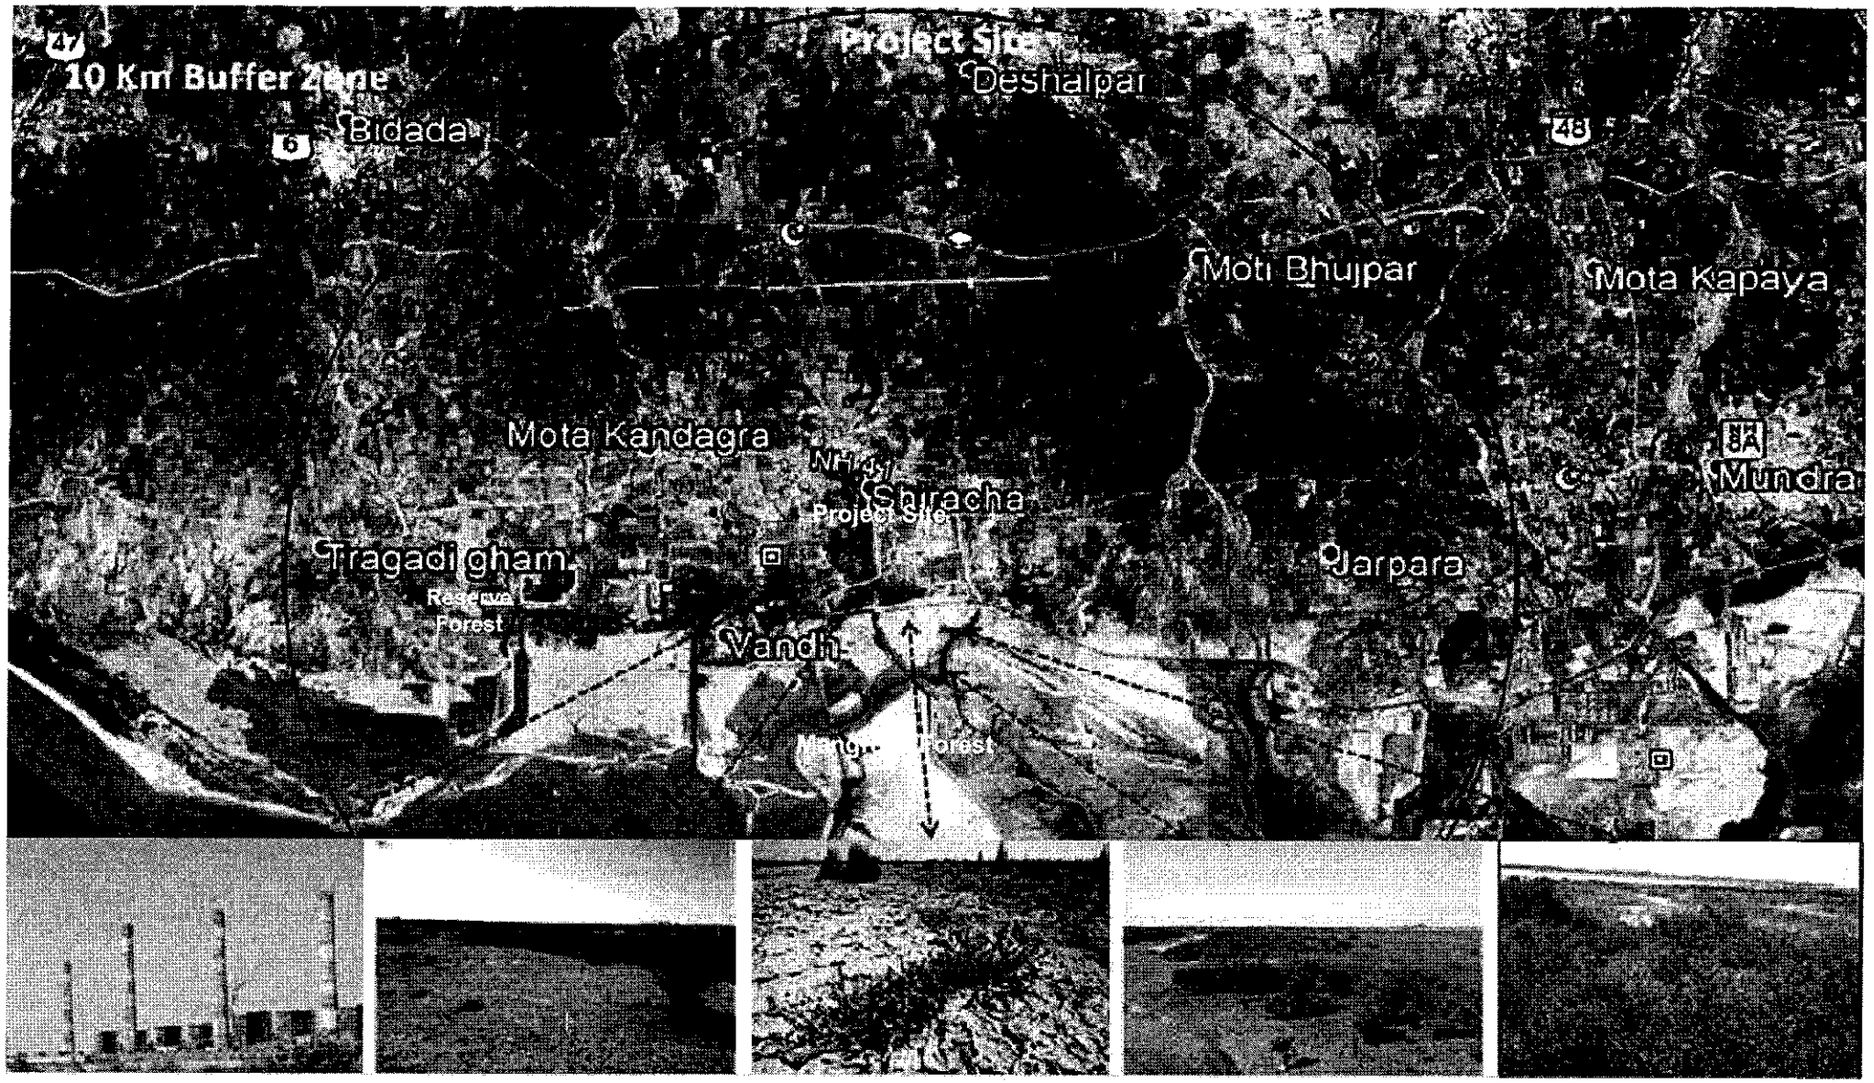
No	Protected Areas	Distance	Direction
1	Marine National Park	33 Km	South-West
2	Marine Sanctuary	35 Km	South-West
3	Narayan Sarovar Sanctuary	103 Km	North-West
4	Kutch Bustard Sanctuary	92 Km	North-West
5	Wild Ass Sanctuary	77 Km	East
6	Kutch Desert Sanctuary	70 Km	North-East
7	Chhari Dhandh Conservation Reserve	82 Km	North
8	Banni Grassland Important Bird Area	69 Km	North



4.3. Landuse Types in the Study Area

We mapped various landuse types of the study area using field surveys and various references available online. The major landuse features are agriculture, sea, mudflats, open scrubland, sparse wasteland, mangroves etc (Table-4.2 & Figure-4.1, Plate-4.1).

Table-4.2: Area & percentages of various landuse types in the study area.



No	Landuse Type	Area (ha.)	% of Area
1	Built up Area	2103.27	5.08
2	Forests	837.62	2.02
3	Agriculture	15484.69	37.41
4	Wasteland	5620.36	13.58
5	Waterbody	9366.3	22.63
6	Wetlands	4469.36	10.80
7	Others	3512.17	8.48
	Total	41.393.77	100.0

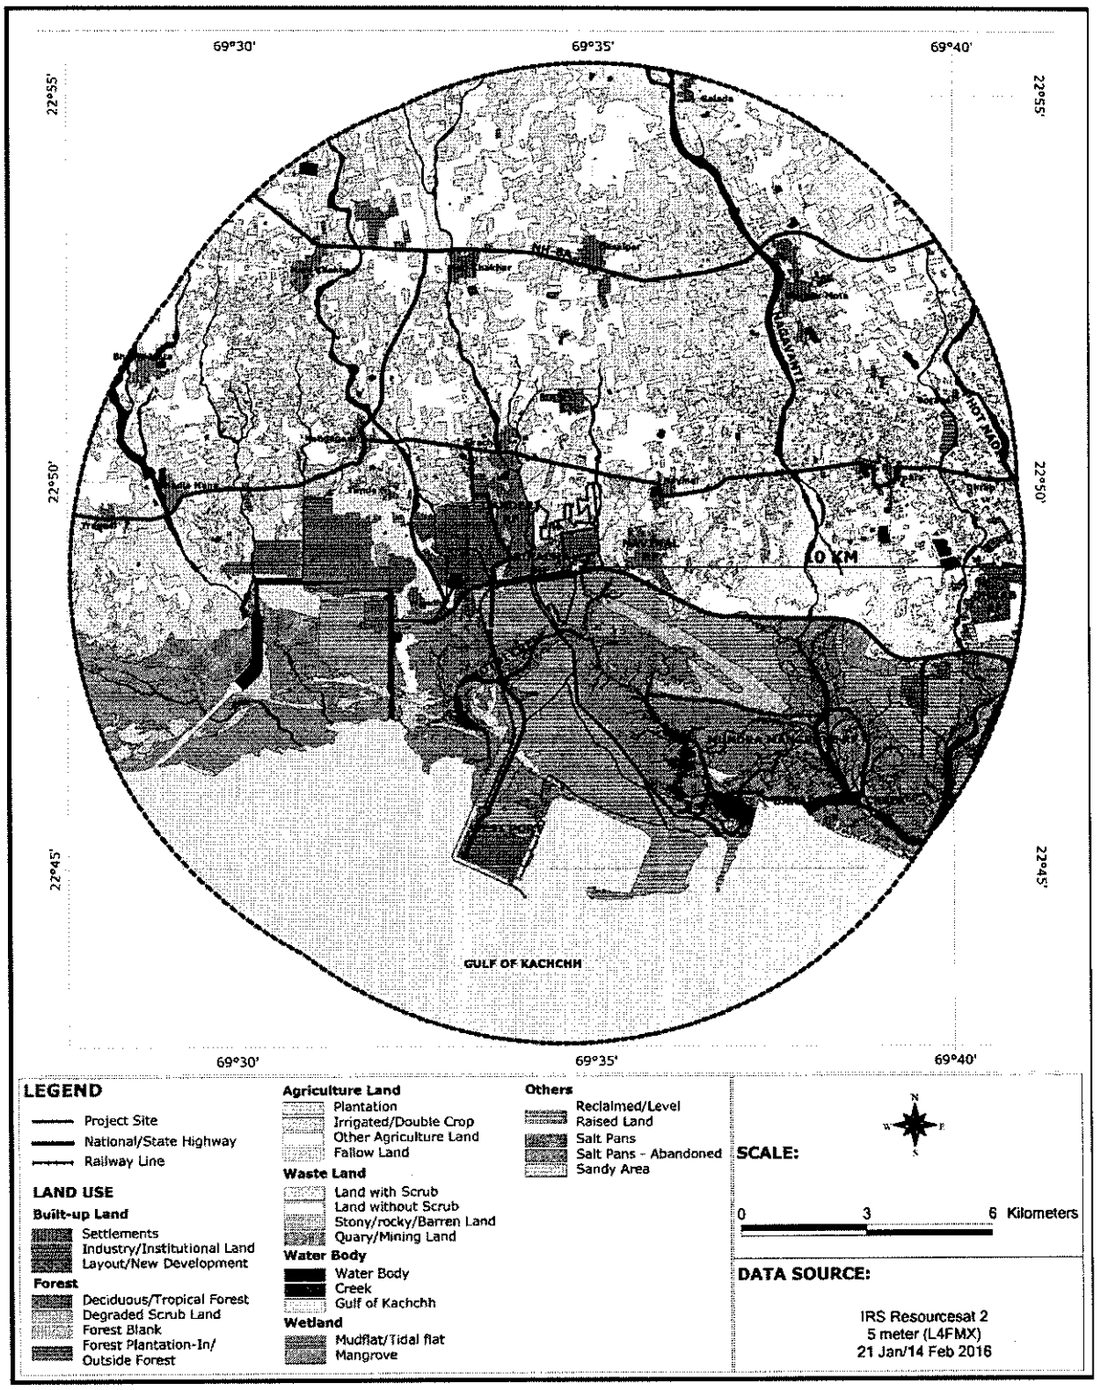
Map-4.1: Project site location vs. protected areas in Kutch district.

3233

Plate-4.1: Project site location and habitat types in the 10 km buffer study area.

2933

Map-4.2: Landuse pattern in the study area.



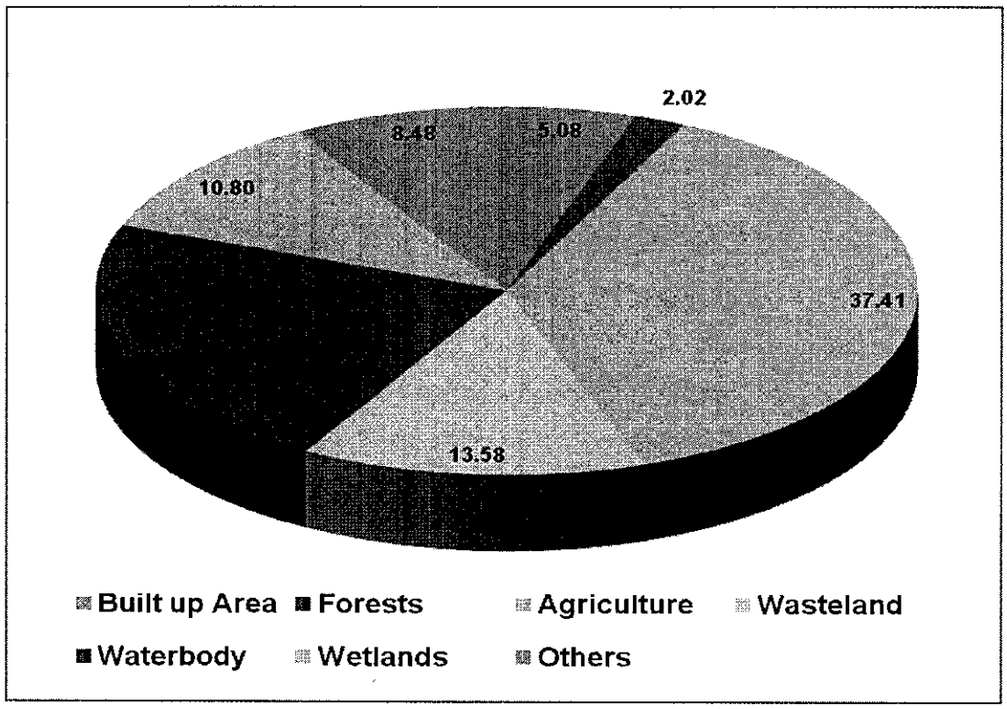


Figure-4.1: Percentage of various landuse classless in the study area.

4.4. Important Ecological Habitats

Based on our field visits and literature survey we identified two important and ecologically sensitive habitats that are located within 10km buffer zone. These habitats are listed below

i. *Forest Area*
ii. *Mangrove ecosystem*
iii. *Waterbodies*
iv. *Important birdwatching site*

4.4.1. Forest Area & Forest Type

As per information received from project proponent, the Land requirement for the project is 256.58 ha. (634 acres), in which 154.19 ha is APSEZ area and 102.39 ha. (253 acres) of land belongs to forest area for promoting industrial development. Therefore, core project area does include forest area. Forest Clearance for this land is under process and stage-I clearance is already received for the same. MoEF&CC (forest conservation division) has granted

Stage-I approval for diversion of 1576.81 ha. of reserved forest land in favour of Adani Ports & Special Economic Zone Limited (APSEZL) vide letter F.No.8-04/2016-FC dated 16th November 2018 (Annexure-IV). Part of the diverted forest land area (253 acres) will be utilized for the proposed copper refinery project after all approvals.

As per the forest classification of Champion and Seth (1968), forest of Kutch district classified under the "Northern Tropical Thorn Forest". The forest area in the proposed project area consists of mostly Prosopis juliflora with scattered trees of *Anogeissus pendula, Acacia leucophloea, Zizyphus mauritiana, Prosopis cineraria, Salvadora persica* and *Salvadora oliodes etc.*

Apart from forest areas involved in the core area, there are forests areas present in the buffer zone which are under the jurisdiction of Kutch West Forest Division of Gujarat Forest Department (Table-4.3). These forest areas are well marked with a boundary wall indicating its possession by the forest department. These forest areas are of two vegetation types 1) Open scrub forest and 2) Mangroves. Total 6419.25 ha. of Reserved Forests area is present in the study area (Table-4.3). Most part of the reserve forest areas (83.0%) is in the form of mangrove forest falling in the creek systems on the coast. Remaining 17.0% falls in the open thorny scrubland forests.

The inland open scrub forests are dominated with dense patches of *Prosopis juliflora* along with scattered plants of *Acacia nilotica, Prosopis cineraria, Zizyphus numularia, Salvadora persica, Salvadora oliodes, Capparis decidua, Calotropis procera, Balanites aegyptica, Butea monosperma, Acacia leucophloea, Casia auriculata etc.* The vegetation type of these forest areas are representative of desert eco-system. The details of the forest areas are given in Table-4.3.

The other kind of forest reserve are situated in costal area for example on high tidal mudflats which are harbouring inadequate patches of mangroves and coastal vegetation details of the region is given in the section on mangroves.

Table-4.3: Details of Forest area and forest types in study area.

No	Village	Survey No	Area	Type
1	Deepa	220/p	17.36	RF Section-20
2	Borana	20/p	26.62	RF Section-20
3	Dhrab	169/p	23.43	RF Section-20
4	Dhrab	169/p	81.59	RF Section-20
5	Jarpara	169/p	26.61	RF Section-20
6	Mundra Mangrove Range	2	5333.73	RF Section-20
7	Mundra Rakhal Dhuvo	2	334.34	Reserve Forest
8	Navinal	223/p	21.85	RF Section-4
9	Navinal	223/p	89.52	RF Section-20
10	Siracha	295/p	125.00	RF Section-20
11	Siracha	295/p	209.20	RF Section-20
12	Siracha	517/p	130.00	RF Section-4

4.4.2. Mangroves Ecosystem

Kutch mangroves distributed in the arid to semi-arid coastal belts are traditionally considered as the low dense mangroves which are mostly degraded. Structural attributes of Kutch mangrove are not comparable with other luxuriant mangrove formations on other coasts of India (Sawale and Thivakaran, 2013). The semi-arid coastal belt of Kutch is known for its harsh environmental conditions like hyper-salinity (36-47 ppt), wider ambient temperature fluctuations (11.2 to 48.7oC), high evopo-transpiration (R/ETP-0.03–0.20) and frequent natural disasters like cyclones and earthquakes (Sawale and Thivakaran, 2013). Added, the recent spurt in inland watershed development schemes deprive the meagre seasonal run-off to neretic waters, rendering it singly conspecific formations of *Avicennia, marina*; a hardy species capable of tolerating high physiological stresses (Sawale and Thivakaran, 2013). Though eight true mangrove species were reported earlier from the Gulf of Kutch, *A. marina* was the only species recorded on the coast of Mundra with sporadic occurrence of *Rhizophora mucronata* and *Ceriops tagal* (Sawale and Thivakaran, 2013). Majority of the mangrove areas are represented by only one species i.e. *Avicennia marina*. Few other species such as *Rhizophora mucronata* and *Ceriops tagal* are planted by forest department as part of their mangrove conservation schemes. National Centre for Sustainable Coastal Management, Chennai, carried out a status

survey ('Comprehensive and Integrated plan for preservation and conservation of mangroves and associated creeks in and around the Adani Ports and Special Economic Zone Ltd., Mundra, Gujarat') of the mangroves along the creeks and adjoining land/island as of 2016-17. The total mangrove cover of the area was estimated to be 2340 ha. There has been an increase of mangrove cover by 246 ha (~10%) compared to the mangrove area of 2011 (using aerial photo of 2011, NCSCM has estimated it to be 2094 ha). In 2016-17, out of 2340 ha, the dense mangroves were 629 ha contributing to 27% of total mangrove cover.

Most of the mangrove areas (83.0%) are located in the notified reserve Mangrove Forest areas of Navinal, Shiracha and Jarpara village coasts (Survey no-2 Mangrove Forests). The coastal area of Tunda, Navinal, Shiracha, Jarpara and Tragdi villages have patches of scattered, sparse and dense mangroves. Most of the mangroves are located on high-tidal mudflats and on the banks of creeks. Major creeks present in 10 km buffer zone study area are Kotdi-I, Kotdi-II, Baradimata-I and Baradimata-II. A sizable patch of dense mangrove is also located at 170 meters (on bank of kotdi- II creek) from Southern most boundary of the proposed project site (Map-4.1, & Map-4.2, Plate-4.1). Dense mangrove formations are common on banks of creeks from 0 to 75 meters where tidal water reaches everyday. Rest of the mangroves are in the form of sparse stunted which are grown on the tertiary branches of tidal creeks.

Kotdi and Baradimata are shallow creeks compared to Bocha, Navinal and Khari creeks. Kotdi I exhibited least depth, and significant areas of the creek are exposed during low tide. In case of Kotdi II creek, though part of mouth is exposed during low tide, considerable sections of the inner parts of the creek have water at MLWS levels. The mouth regions of both main branches of Baradimata creek were covered with water during high tide. Due to the presence of water covered areas during high tide, Kotdi I & Kotdi II and branches of Baradimata-I and Baradimata-II have conditions conducive for growth of mangroves.

4.4.3. Waterbodies

Our observation and literature review suggests that there are no major inland wetlands present within the study area i.e. 10.0 km buffer zone of the project site. Drainage pattern of the study area and project site are drained by several rivers and small tributaries, which are of dendritic pattern which remains dry in almost all the season. The Dhaneswari River (Danesri Nadi) a seasonal river (rain fed) flows in the western part of the project site. The water bodies flows through study area are Kotdi creek (0.5 km, S), Khari Nadi (1.9 km, W), Gulf of Kutch (3.9 km, S), Nagavanti Nadi (4.7 km, E) and Phot Nadi (8.7 km, ENE) from the project site. Natural drainage passing through the site will be suitably trained and maintained. These drainages have small check dams built on them which are known to accumulate overflowing runoff water for a short period. Apart from being important hydrological features in the semi-arid area, these check dams provide important habitat for many bird species and water source for wildlife in the region. One such drain is Khari River which flows from North-to South in western side of proposed project site. There is no check dam on this river in the vicinity of project site. However, all such drainages are seasonal in nature and flows only during rainy days. These drainages flows water from main land to Gulf of Kutch. Most of the stagnant water sources i.e. check-dams are located at substantial distances i.e. more than 2.5 km distance from the proposed project site. There will not be any diversion of rivers. Further, conveyer for copper concentrate and rock phosphate and acid pipeline will cross over the existing water intake channel available for power plant. Suitable culverts will be built as required.

4.4.4. Important Birdwatching Site

Majority of the waterbird species reported in the present study are found at Modhva mudflats located beyond 11.0 km south-west outside the study area. It is located adjacent to Sea water outfall of CGPL. Modhva area is a mix of sandy beach, saltpans, coastal mudflats with scattered mangroves and thorny bushes on the coast which provides a suitable mix of wetland habitat

to attract large populations of migratory and resident birds. Most importantly this area provides much needed staging and stop over sites for the migratory birds flying on Central Asian Migratory bird Flyway.

The Modhva coastal area is known amongst the birdwatcher as it is one of the important and prominent birdwatching and bird photography sites of Kutch. The national and international birdwatching tour agencies bring their keen birdwatching and bird photography clients to this birdwatching site of Kutch. The site is known for shore birds such as Crab plover, Oystercatcher and waterbirds such as flamingos etc. The site is therefore one of the important eco-tourism sites of Kutch. Therefore in view of its ecological and economical value, Modhva coastal area is considered as important site for conservation. Since it lies outside the study area i.e. 10.0km, there are negligible chances of impacts on this area by the proposed project.

4.5. Floral Diversity and Vegetation Type in Core & Buffer Area

We evaluated biodiversity and abundance parameters of vegetation/plant species in the core area and in the buffer area of the project site.

4.5.1. Vegetation Type & Community in Core Area & Buffer Area:

Core area: The proposed project site falls in the arid-semi arid climatic condition. Our field survey and literature review suggest that the vegetation types and community in the project area is that of semi arid-arid regions. It is represented by sparse thorny scrub vegetation in two industrial areas i.e. thermal power plants. The major part of the project area is devoid of large trees and mainly consists of dense and sparse shrubs i.e. *Prosopis juliflora, Prosopis cineraria, Acacia nilotica, Casia auriculata* and *Zizyphus numularia, caparis deciduas etc.* the major grasses include several species of *Cyperus* and herbs *Indigofera*. Details of vegetation survey results are discussed in forth coming sections.

Buffer area: The buffer area (10.0 km periphery) comprises mainly of agriculture fields, wastelands, forest plantation patches by forest department,

scattered bushes of *Prosopis juliflora, Prosopis cineraria, Acacia nilotica, Salvadora persica, Salvadora oliodes, Azadirachta indica. Prosopis juliflora* and *Zizyphus numularia* among the wild plants and cotton, coconut, dates, pomegranate, among the cultivated crops are the most dominant plants in the buffer area.

Except for highly scattered and small plants of *Commiphora wightii*, there were no rare, endangered or conservation concern species present in the close vicinity of the project area in the buffer zone. Major part of the buffer area is agriculture fields particularly on the Eastern side of the project area. Since ground water is saline up to 15 km from the coast and highly saline up to 4 km from the coast. Thus, dry land farming is practiced near the coast and irrigated farming is practiced in the farms that are 5-6 km away from the coast. Cotton, Jowar, Bajra are the main crops grown here. Some villages, especially in the central corridor are endowed with good surface water facilities, and irrigated agriculture is possible in these villages. Being semi-arid, arid zone, this region support low plant growth and therefore, not many large trees with sizable canopies are present in the buffer zone. However, at every village local people have managed to grow trees for shade, aesthetic and religious values.

Though, we could not report presence of some of the important species plant species (probably due to lack of rain species did not occur), according to literature survey, Navinal area at Mundra has representation of native vegetation of Kutch. Some of the important threatened plant species reported from the region include *Dipcadi erythraeum, Helichrysum cutchicum, Ephedra foliata, Heliotropium rariflorum, Tribulus rajasthanensis, Pavonia ceratocarpa, Convolvulus stocksii, Commiphora wightii.* Out of this *Helichrysum cutchicum, Ephedra foliata and Tribulus rajasthanensis* are endemic species. Gujarat State Biodiversity Board earlier proposed to declare the area as biodiversity heritage site. However the proposed development of the "Biodiversity Park at Navinal village, Mundra Taluka" has been shelved by Gujarat State Biodiversity Board, though initially proposed.

Hence, it is given to understand that the earlier proposed biodiversity park will not be further developed in the study area.

4.5.2. Floral Abundance, Frequency and Density

Based on our vegetation sampling data we derived various measures of abundance of plants species in the core and buffer area of the project site (Table-4.4). These parameters help understand the vegetation community structure in the project area/core area and buffer area/ surrounding area. We found total 12 species of Grass, 12 herbs, 4 shrubs and 2 tree species in the project core area. Where as we reported total 22 species of grasses, 26 species of herbs, 8 species of shrubs and 7 species of trees during our sampling efforts in the buffer areas. There could be more species of plants in the study area. However, our sampling and analysis of the vegetation data suggests that the abundance and density of plant species are lower in the core and buffer area (Table-4.4). This suggests that the area falls in Arid-semi arid condition. As per classification of biome, biogeographic zone, biogeographic province, this area falls in Indian Desert/Kutch Desert/Northern Thorny Scrub Forest. These classifications of the study area suggest lower abundance, density and diversity of plants in the region is reflected in our floral study of the project area.

4.5.3. Dominant Plant Species

Important Value Index is a parameter for calculating the dominance and diversity indices for vegetation as it is combination of frequency, density and dominance. Based on our survey results we found that *Prosopis juliflora* & *Zizyphus numularia, Salvadora,* in shrubs and *Cymbopogon martini, Aristida, Dichanthium annulatum,* in grasses and *Casia auriculata etc. in herbs* are the most dominant species in the region (Table4-4). This is derived through, the Important Value Index (IVI) that we calculated for various plant species through quadrate sampling (Table4-4). IVI for *Prosopis juliflora* was 58.7 in buffer and 103.0 in core area. Whereas, *Aeluropus lagopoides (9.5/47.2), Cymbopogon martinii (116.7/*35.6*)* were in the buffer and core areas respectively.

3243

Table-4.4: Floral Diversity and their relative frequency, abundance density, important value index for core and buffer area.

No	Type/ Class	Species	Abundance		Relative Frequency		Relative Dominance		Relative Density		IVI	
			Buffer	Core	Buffer	Core	Buffer	Core	Buffer	Core	Buffer	Core
1	Grass	*Aeluropus lagopoides*	1.86	1.6	7.45	16.7	7.40	8.3	10.24	22.2	25.09	47.2

4.5.4. Invasive or Exotic Species

Prosopis juliflora is an evergreen tree native to South America, Central America and the Caribbean. In the United States, it is well known as mesquite. It is fast growing, nitrogen-fixing and tolerant to arid conditions and saline soils. *Prosopis julifl*ora is an exotic and invasive widespread, multi-branched shrub/tree species in the India. It has been invading grasslands, native scrubland and forests of Gujarat and India.

Our study showed that the *Prosopis juliflora* is one of the most dominant and wide spread in the core and buffer areas of the project site. Our biodiversity, abundance, density measures suggests *Prosopis juliflora* is fast growing in the area.

4.5.5. Floral Biodiversity in the Study Area

In order to understand the status of vegetation communities in terms of stability, diversity indices such as species dominance, species diversity, similarity index and abundance are derived.

Table-4.5: Biodiversity indices (Averages) for core and buffer areas.

Indices	Buffer Area		Core Area	
	Grass	Other vegetation	Grass	Other vegetation
Species Richness	22	41	12	18
Dominance_D	0.05	0.12	0.12	0.26
Simpson_1-D	0.94	0.88	0.88	0.74
Shannon_H	2.96	2.97	2.26	2.08
Evenness_e^H/S	0.88	0.47	0.80	0.44

Shannon-Wiener Diversity Index: The biodiversity values for core and buffer areas were derived from the quadrate samples laid in the field. The value of the Shannon-Wiener Index (H') usually lies between 1.5 and 3.5 for ecological data and rarely exceeds 4.0. Lower value of Shannon-Wiener Index (H') suggests degraded or arid conditions with low biodiversity values. Our results suggest the H' value to be normal for the dry arid conditions

(Table-4.5). There was difference between the core and buffer area in terms of diversity indices. This was because core area mostly consists of Prosopis juliflora dominated bushes and saline land with open wasteland where as in buffer area there is variety of habitats and agriculture lands.

Species Richness (S): It is a count of the number of species found when the observers sample the community. It is represented by "S". Our data analysis for the core and buffer zone suggests that average species richness per sample is lower in core area compared to that of buffer area (Table-4.5). This is because of the difference in the land use types in core and buffer areas.

Simpson's Diversity Index (D): The Simpson index is one of the most meaningful and robust diversity measures available. In essence it captures the variance of the species abundance distribution. It is a diversity index proposed by Simpson (1949), to describe the probability that a second individual drawn from a population should be of the same species as the first. The value of D varies between 0 and 1. Our data analysis suggests that relatively core area is less diverse than the buffer area as the D value is higher in core area than in the buffer area (Table-4.5).

Evenness: It is a measure of species diversity, which quantifies how equal the community is numerically. The less variation in communities between the species show higher evenness. The value varies between 0 and 1. Our data analysis for core and buffer zone showed higher values of this index suggesting that the communities of vegetation does not vary much within the core and outside in the buffer areas (Table 4-5).

4.5.6. Endangered/Threatened/Protected Species

Our field survey in the project area suggest that there are no endangered, endemic, rare plant species present within the project boundary i.e. core area. However, we found an important species i.e. *Commiphora wightii*, in the buffer area with low abundance and frequency of occurrence (Table-4.4). This plant has high medicinal value and is facing the threats of extinction by

overexploitation for commercial purpose (GUIDE, 2009, Joshi et al. 2005) from Kutch.

4.6. Faunal Diversity and Species Inventory

The present study has made assessment of 3 major higher vertebrate classes such as Reptiles, Birds and Mammals. The assessment of fauna representing higher trophic levels in the ecosystem was carried out since their diversity acts as indicators of the health of the ecosystem in which they live. The details of the results/observations are given as following.

4.6.1. Reptiles Species Recorded During the Survey

Majority of the reptile species are fossorial in habit, therefore the assessment of reptiles and their diversity etc. holds special significance for any development project. In the present study we identified a total of 6 species of reptiles within the core area and 12 species in the buffer area (Table-4.6).

Table-4.6: Checklist of reptiles reported form the core and buffer area.

S. No.	Name of Species		Conservation Status as per IWPA-1972 (Schedule I to VI)	Conserv -ation Status as per IUCN	Observed/ Reported	
	Common Name	Scientific Name			Core Area	Buffer Area
1	Cheakered Keelback	*Natrix piscator*	Schedule-IV	LC		1
2	Common Skink	*Mubuya carinata*	Schedule-IV	LC	1	1
3	Fan Throated Lizard	*Sitana ponticeriana*	Schedule-IV	LC	1	1
4	Flap shell Turtle	*Lissemus punctatea*	Schedule-I	LC		1
5	Garden Lizard	*Calotes versicolor*	Schedule-IV	LC	1	1
6	Indian Fringe Toed Lizard	*Acanthodactylus cantoris*	Schedule-IV	LC	1	1
7	Indian monitor lizard	*Varanus bengalensis*	Schedule-I	LC		1
8	John Sand Boa	*Eryx johni*	Schedule-IV	LC	1	1
9	Rat Snake	*Ptyas mucosus*	Schedule-IV	NT		1
10	Saw scaled Viper	*Echis carinatus*	Schedule-IV	NT		1
11	Short tailed Agama	*Agama minor*	Schedule-IV	LC	1	1
12	Spiny-tailed Lizard	*Uromastix hardwickii*	Schedule-II	LC		1
VU=Vulnerable, EN=Endangered, NT=Near Threatened, LC=Least Concerned						

Of the reported reptiles species in the buffer area, 2 species (Flap shelled turtle and Indian Monitor Lizard) belong to Schedule-I of the Wildlife Protection Act 1972. No threatened species of reptiles as classified by the IUCN are reported from core or buffer area during our survey. The Indian Flap shell turtle was reported from waterbodies in buffer area which is common throughout country is also listed as least concerned by IUCN. However, one species belong to Schedule-II (Spiny tailed Lizard) where as reset of the species belong to Schedule-IV. Majority of the reptile species (except Rat snake and Saw scaled viper) reported from the buffer area fall in 'Least Concerned' category of IUCN. No endangered, rare, threatened or endemic species of reptiles was reported from the project core area.

4.6.2. Birds Species Recorded During the Survey

During the study we observed a total of 95 bird species in the study area. Majority of the species (74) are resident specie, where as only 21 species were found to be migratory (Table-4.7). Of these 95 recorded bird species, 89 belong to 'Least Concerned' category rated by IUCN where as total 6 species are i.e. Painted Stork, Oriental White Ibis, Eurasian Curlew, Lesser Flamingo, Oriental Darter and Black tailed Godwit belong to Near Threatened Species (Table-4.7).

Majority of the birds reported from the core and buffer area belong to the Schedule-IV of Wildlife Protection Act 1972 (Table-4.7). Whereas, total 5 species (Black shoulder kite, Eurasian Spoonbill, Indian Peafowl, Marsh Harrier, Shikra) belong to Schedule-I of IWPA 1972. Whereas House crow belong to Schedule-V.

The birds were recorded mainly from non-forested, degraded areas and in the surrounding agriculture landscape interspersed with scattered trees and drainages. The bird species groups observed in the study area were represented by species of open scrubland such as Passerines, Shrikes, Francolin, etc. and waterbodies birds such as Waders/shorebirds, Waterbirds, Egrets, Herons sandpipers, plovers etc. Majority of the birds

3250

Table-4.7: Inventory of birds reported from the study area with their conservation status.

S. No.	Name of Species		IWPA-1972 Status	IUCN Status	Observation		Migratory
	Common Name	Scientific Name			Core	Buffer

NT=Near Threatened, LC=Least Concerned; R=Resident, M=Migratory

observed in the study area represent birds of wetlands, coastal mudflats, wetland and semi arid non-forested landscapes etc. Moreover, many of the bird species reported in the present study are common even in human dominated landscapes such as urban cities, lakes and ponds etc. Majority of the waterbird species reported here are found from adjoining reserve forest areas, mangrove creeks, and mudflats located south-west side in the study area. Intertidal mudflats, saltpan and the coastal creeks provide suitable mix of wetland habitat which attracts large populations of migratory and resident birds. Most importantly this area provides much needed staging and stop over sites for the migratory birds flying on Central Asian Migratory bird Flyway. The Modhva coastal area is well known amongst the birdwatcher as it is one of the most important and prominent birdwatching and bird photography sites of Kutch. However, this site is located beyond 11.0 km therefore, lies outside the study area. Majority of the resident species reported in the study area are known to breed in this region as well as in entire Gujarat. No rare, endangered, endemic bird species were found to breed in the core project area.

4.6.3. Mammal Species Recorded During the Survey

We observed a total of 13 mammal species in the buffer area and 6 in the core area of the project site (Table- 4.8). The common mammalian species that were directly observed in the core area include Indian Jackal, Wild Pig, Common Mongoose, Indian Hare, Indian desert gerbil and Five Striped Squirrel etc.

No Threatened or Schedule-I species reported from the core area of the project site (Table-4.8). Indian Jackal, Jungle cat, Indian Fox, Common Mongoose belong to Schedule-II of IWPA 1972. Whereas Nilgai, Wildpig belong to Schedule-III. Rest of the species belong to Schedule-IV of WPA. Majority of the common mammalian species recorded during the survey in the core and buffer area are present throughout semiarid, non-forested and non-protected landscapes especially in Kutch region.

4.6.4. Dominant Faunal Species in the Core & Buffer Area

Based on our observations, interview survey of local people, forest officials and NGOs working in nature conservation activities in Kutch region, we found that Nilgai, Wild Pig are most common and dominant mammal species present in the landscape. Whereas there were several birds species belong to Passerine were most common and dominant group of birds present in the core and buffer area of the project site. Among reptiles, Spiny tailed Lizard, common garden lizard, Indian Monitor Lizard etc. were most common species present in the buffer areas of the project site.

Table-4.8: Inventory and conservation status of mammals reported from study area.

S. No.	Name of Species		Conservation Status as per IWPA-1972	Conservation Status as per IUCN	Observation	
	Common Name	Scientific Name			Core	Buffer
1	Indian Jackal	*Canis aureus*	Schedule-II	LC	1	1
2	Jungle cat	*Felis chaus*	Schedule-II	LC		1
3	Indian Fox	*Vulpes bengalensis*	Schedule-II	LC		1
4	Nilgai	*Boselaphus tragocamelus*	Schedule-III	LC		1
5	**Chinkara**	***Gazella bennettii***	**Schedule-I**	**LC**		**1**
6	Indian Hare	*Lepus nigricollis*	Schedule-IV	LC	1	1
7	Wild Pig	*Sus scrofa*	Schedule-III	LC	**1**	1
8	Common mongoose	*Herpestes edwardsi*	Schedule-II	LC	1	1
9	Indian porcupine	*Hystrix indica*	Schedule-IV	LC		1
10	Palm squirrel	*Funambulus pennanti*	Schedule-IV	LC	1	1
11	Fruit Bat	*Cyanopterus sphynx*	Schedule-V	LC		1
12	Long-eared hedgehog	*Hemiechinus auritus*	Schedule-IV	LC	1	1
13	Indian desert gerbil	*Meriones hurrianae*	Schedule-IV	LC		1

4.6.5. Wildlife Corridors

Our observations suggested that there is no rare, endangered, conservation concern species of fauna present within the proposed project core area. The proposed project area for Copper Refinery Plant is not a part of any special habitat (breeding) for any of the Threatened or Schedule-I important fauna and does not provide any contiguity of habitats between two important habitats or any other protected areas. Moreover, the proposed project area is located in close to already industrialized zone therefore; it does not make part of any wildlife habitats. Apart from this, there are no protected areas located within 30.0 km radius of the proposed project site therefore; the proposed area does not seem to make part of any wildlife corridors.

4.6.6. Identification of Species of High Conservation Significance

Based on our extensive field visits, literature survey, and consultation with experts & local people, we found following 8 species that are of high conservation significance (Table-4.9).

Table-4.9: Species of high conservation significance (Threatened or Schedule-I) present in the study area.

S. No.	Name of Species		IWPA-Status	IUCN Status
	Scientific Name	Common Name		
Reptiles	Flap shell Turtle	*Lissemus punctatea*	Schedule-I	LC
	Indian monitor lizard	*Varanus bengalensis*	Schedule-I	LC
Bird	Black shoulder kite	*Elanus caeruleus*	Schedule-I	LC
	Eurasian Spoonbill	*Platalea leucorodia*	Schedule-I	LC
	Indian Peafowl	*Pavo cristatus*	Schedule-I	LC
	Marsh Harrier	*Circus aeruginosus*	Schedule-I	LC
	Shikra	*Accipiter badius*	Schedule-I	LC
Mammal	Chinkara	*Gazella bennettii*	Schedule-I	LC

We found total 8 faunal species belong to Schedule-I of Wildlife Protection Act 1972. These species include 2 species of reptiles, 5 species of birds and one mammal. These species are present in the buffer zone of 10 km radius i.e. study area.

5. Potential Impacts & Mitigations

Impacts of proposed Copper Refinery Plant on flora and fauna of surrounding area were identified mainly by using baseline ecological information presented in previous Chapter-4. The baseline information was collected through direct field visits and substantiated through secondary information including EIA, consultation with local people etc. We also utilized assessment provided in the EIA particularly Air modelling information. Finally, the baseline ecological information was juxtaposed with the project activities and impacts arising due to its construction and operation phases. The specific impacts were visualized in terms of issues related with the ecology of important species issues related with their habitats.

Following the above mentioned approach, impacts on various components of biodiversity were assessed. The component wise identification of potential impacts is deliberated below.

5.1. Anticipated Ecological Impacts of Proposed Project Activity

M/s. Adani Enterprises Limited (AEL) intends to set up a Greenfield copper refinery project of 1.0 MTPA (10 LTPA) capacity in 256.58 ha. of area, which includes facilities like copper smelter, sulphuric acid plant, copper refinery, continuous cast copper wire rod plant, precious metal recovery plant, phosphoric acid plant, aluminium fluoride plant, effluent treatment plant, utilities storage of water and fuel, etc. with the state of the art environment friendly technology, which will be located at Adani Port Special Economic Zone (APSEZ) land in villages Siracha and Navinal, Taluka Mundra, district Kutch, Gujarat.

The above mentioned project in absence of mitigation measures could have numerous ecological impacts during the construction and operation phases. The impacts during construction phase could be short term, temporary in nature and will be confined to the close boundary of the project site. Following are the general ecological impacts anticipated from the construction and operation phases of the copper refinery plant.

- Irreversible change in landuse/habitat worth the project area. Vegetation would be removed from the project site. Total 154.19 ha of APSEZ land and 102.39 ha. forest land would be converted to industrial use.

- Copper is a metal that occurs naturally in the environment, and also in plants and animals. Low levels of copper are essential for maintaining good health. Elevated levels of copper are toxic in aquatic environments and may adversely affect fish, invertebrates, plants, and amphibians.

- Chronic fugitive emissions and the material flow through water and air could potentially degrade aquatic and terrestrial eco-systems. Copper refinery is likely to release toxic fumes, pollutants such as compounds of sulphur, fumes of metals like Cd, Zn etc., & impurities like Ni, Fe, As, Sb in surrounding environment and cause irreversible damage to ecology if strict environment control measures are not implemented.

- The major impact on terrestrial ecology could be due to emission of dust which will settle on surrounding area soil and vegetation and it would gradually decrease biomass productivity of the eco-systems.

- During the construction work, the excavation of the soil take place and construction wastes such as oil, grease and debris may pollute the soil and decrease its productivity.

- The impact on the terrestrial ecology could be due to the emission of pollutants such as SO_2 and Particulate Matters (PMs) due to dusting. When sulfur dioxide combines with water and air, it forms sulfuric acid, which is the main component of acid rain. Acid rain can cause deforestation and could potentially acidify waterways to the detriment of aquatic life.

- Project site runoff drains into Kotdi creek system of Gulf of Kutch through minor drainages. Chronic spillage and flow of pollutants and

dust sediments from the project site through runoff could have severe impacts on flora and fauna of Kotdi creek system which include mangroves, birds, fishes, crabs etc.

5.2. Impacts on Terrestrial Flora

Baseline status of terrestrial vegetation clearly suggests that the project sites falls in semi-arid and coastal biogeographic zone with low floral density and diversity.

Removal of vegetation: The proposed copper refinery plant construction activities may involve removal of vegetation from the project site. Out of total 256.58 ha. 33% i.e. 85.79 ha. area would be used for green belt/green cover. Whereas 170.79 ha. area would be cleared off vegetation. Therefore, standing vegetation from total 170.79 ha. area would be removed permanently. The vegetation in the proposed project site consists of mostly *Prosopis juliflora* which is an invasive species. Therefore, the unavoidable removal of vegetation during construction activity from the core area could not be considered significant. However, it is recommended that minimum vegetation shall be removed from the project site and the important plant and tree species on the periphery of the project site be left as part of green belt development. Apart from this, project proponent would be providing compensatory land to forest department which would compensate the loss of forest land.

Pollution affecting soil, water & plants growth: Suspended particulate matter produced during construction and operational phase of the copper refinery plant would be deposited in the surrounding forest areas and water bodies including river will change habitat quality of aquatic and terrestrial ecosystem. Their direct deposition on vegetation causes loss of chlorophyll content in leaves, arrest of photosynthesis process, leaf injuries resulting in restricted growth and regeneration of plants. There are patches of forest plantations and mangroves located in the buffer area of the proposed project site.

According to air modelling carried out by EIA agency, it is predicted that the pollutants would travel up to 2.2 km North-East direction. The project area is partly located in the forest area. Also there are reserve forest areas located adjacent to the proposed project site, hence chances of pollutants and dust causing degradation of the forests and vegetation in surrounding area is higher if strict pollution control measures are not implemented. Development of thick green belt would also restrict pollutants spreading outside the premises. It is also recommended that a tall compound wall shall be built on the periphery of the project area premises this would restrict spread of pollutants.

Degradation of vegetation due to acid rain: It is also well known through number of studies that SO_2 emission from copper refinery plant has been a major cause of acid precipitation, commonly known as "acid rain," which can damage vegetation. These pollutants originate from copper plants and nearby thermal power plants would interact with reactants present in the atmosphere and result into acid deposition. Due to the interaction of these acids with other constituents of the atmosphere, protons are released causing increase in the soil acidity, lowering of soil pH mobilizes and leaches away nutrient cations and increases availability of toxic heavy metals. Such changes in the soil chemical characteristics reduce the soil fertility, which ultimately causes the negative impact on growth and productivity of forest trees and crop plants. Strict pollution control using state of the art technology measures would restrict emission of gaseous emissions.

Impacts on important flora: Though, we did not report presence of some of the important plant species (probably due to lack of rain species did not occur), according to literature survey, Navinal area at Mundra has representation of native vegetation of Kutch. Some of the important threatened plant species reported from the region include *Dipcadi erythraeum, Helichrysum cutchicum, Ephedra foliata, Heliotropium rariflorum, Tribulus rajasthanensis, Pavonia ceratocarpa, Convolvulus stocksii, Commiphora wightii.* Out of this *Helichrysum cutchicum, Ephedra*

foliata and Tribulus rajasthanensis are endemic species. Our present survey also reported presence of a 'Critically Endangered' species listed by IUCN i.e. *Commiphora wightii* in the surrounding forests and wasteland areas. If no strict pollution control measures are taken, these species and their habitats could be affected. *Commiphora wightii* is medicinally and economically important plant which has very slow growth rate in semi-arid zones. However, their population is quite small and isolated in the buffer area. Also they are found in quite stunted stage. It is recommended that project proponent shall financially support forest department's activities to conserve these endemic and important species found in this region by way of carrying out plantation activities specifically to conserve these species.

Impacts on Mangroves: The baseline information suggests that the coastal area of Tunda, Navinal, Shiracha, Jarpara and Tragdi villages have patches of scattered, sparse and dense mangroves. Most of the mangrove areas are located in the notified reserve Mangrove Forest areas of Navinal, Shiracha and Jarpara village coasts. Closest mangrove distribution is located at 170 meters South form the project areas on the bank of Kotdi creek (Map-4.2). However, a sizable patch of dense mangrove is also located on the coast of Tragdi village.

The closest mangrove distribution is located at 170 meters (on bank of Kotdi –II creek) from South of the proposed project site (Map-4.1, & Map-4.2). Therefore, the chances of damage to mangroves by fugitive emission are high which are located immediate south of the project site. Though the predominant wind direction is from south-west in the region, there are still chances of mangrove being impacted due to its close distance from the project site. It is therefore, recommended that strict pollution control measures shall be implemented so that the mangrove south of the project area are least affected.

Apart from the above mentioned impact, a drainage known as Dhaneshri Nadi flows through the western part of the project site and it drains into Kotdi Creek system. Kotdi creek system has sparse and dense mangrove growth

on both sides. Therefore, if the Dhaneshri river/drainage is not trained suitably, it may carry spilled out pollutant load from the project area to the mangrove eco-system of Kotdi creek. This may increase heavy metal toxicity to mangrove and its habitats. Therefore, it is recommended that Dhaneshri River should be trained in such a way so that it does not carry runoff from the project area.

Since mangroves are important plants and constitutes important eco-system in the study area, it is recommended that project proponent shall chalk out a detailed mangrove conservation plan. Aim & Objective of mangrove conservation plan shall be to strictly avoid any damage by the project activities, preserve and add more mangrove areas. The mangrove conservation plan shall include following aspects.

- Identification potential mangrove plantation area in the study area for taking up mangrove plantations.
- Systematic monitoring of mangrove stock at every 5 years for 20 years. Monitoring shall include monitoring of species diversity, tree density, tree height, tree girth (GBH), regeneration classes, recruitment classes etc. in the study area.
- Creating awareness about mangrove and their conservation among local villagers in the study area.
- Review of the actions taken at every 5 years and extend the plan accordingly if necessary.

5.3. Impacts on Fauna

Though, the impacts of proposed plant and related construction activities may be on several faunal taxa, but for the present study we focused mainly on vertebrate classes i.e. reptiles, birds and mammals for identification of impacts and future monitoring purpose. Therefore, in the present study we identified impacts on the reptiles, birds and mammals particularly important, threatened, endemic and flagship species of the landscape.

5.3.1. Impacts on Reptiles

The baseline study has reported total 12 species of reptiles reported from the study area and 6 species from core area. No rare, endangered or Schedule-I species are reported from the core area i.e project site. However, Flap shell Turtle, and Indian Monitor Lizard are reported from the buffer area which belongs to Schedule-I of Wildlife Protection Act 1972. These species are listed as Least concerned as per IUCN Red list categories. However, a species i.e. *Uromastix hardwickii* belong to Schedule-II which is reported from buffer area. This is a resident and most vulnerable species as it is localized and sedentary unlike other reptiles such as snakes and lizards. This species is often hunted or poached for their oil and meat. Therefore, it is recommended that during construction phase no construction workers shall be involved in poaching of such species. Since no rare or high conservation significance species of reptiles is present in the core and immediate buffer area of the proposed project site, the impact on the reptiles could be low.

5.3.2. Impacts on Birds

We observed total 95 species of birds in the study area. We identified total 5 species of high conservation significance which are species protected as Schedule-I species under Wildlife Protection Act 1972. Most important bird habitat is identified near Modhva coast, is located beyond 11.0 km distance i.e. outside the study area. Intertidal mudflat, sandy beach, mangrove, coastal thorn forest etc. Provide favourable and suitable habitats to large number of resident and migratory birds. Since this area is located beyound 10.0 km south west from the project site, the impact of project activities is expected to be negligible due to opposite wind direction most time of the year. However, project proponent shall take utmost care in controlling dust, fugitive emissions and pollutants flowing to this area thorugh water or air. Therefore, it is recommended that the pollutoin control measures shall be strictly implemented by project proponent during construction and operation phase.

It is often noticed, that construction workers engage in poaching of wild animals particularly birds which are easy to trap using various methods. It is therefore, recommended that construction workers shall be strictly instructed so that they don't engage in such acts. It is also recommended that project proponent shall monitor the status of this ecologically and economically important birdwatching habitat as part of their periodic comprehensive biodiversity monitoring programme.

5.3.3. Impacts on Mammals

We observed a total of 13 mammal species in the buffer area and 6 in the core area of the project site. No Threatened or Schedule-I species reported from the core area of the project site. Majority of the common mammalian species recorded during the survey in the core and buffer area are present throughout semiarid, non-forested and non-protected landscapes especially in Kutch region.

There are only few most common mammals species present in the core area reported during the study. These species would be displaced during construction phase and operation phase. There is only one schedule-I species, present in the buffer area. Overall habitat degradation due to change in landuse pattern, pollution (dusting, air, and noise), increase human presence, increased illumination, increased traffic etc. in and around proposed project area would displace majority of the mammal species from the project core and surrounding buffer areas. Therefore, project proponent shall control emission and dust pollution which would not affect the forest areas and vegetation in the surrounding area which provides resting and feeding habitats to mammalian species in the study area.

6. Wildlife Conservation Plan

Based on our field observations and literature survey we found several species important plant and animal species as well as Schedule-I wildlife species in the study area (Table-6.1). We reported a plant species and 12 animal species. The faunal wildlife species include 2 species of Reptiles, 9 species of birds and one species of mammal.

Table-6.1: Species of higher conservation significance present in the study area.

Sr. No.	Name of Species		IWPA-1972 Status	IUCN Status
	Common Name	Scientific Name		
Plants	Gugal	*Commiphora wightii*		CR
	Mangroves	*Avicennia marina*	Important	LC
Reptiles	Flap shell Turtle	*Lissemus punctatea*	Schedule-I	LC
	Indian monitor lizard	*Varanus bengalensis*	Schedule-I	LC
Bird	Black shoulder kite	*Elanus caeruleus*	Schedule-I	LC
	Eurasian Spoonbill	*Platalea leucorodia*	Schedule-I	LC
	Indian Peafowl	*Pavo cristatus*	Schedule-I	LC
	Marsh Harrier	*Circus aeruginosus*	Schedule-I	LC
	Shikra	*Accipiter badius*	Schedule-I	LC
Mammal	Chinkara	*Gazella bennettii*	Schedule-I	LC

Species wise status, impacts and the mitigation measures are suggested in as follow.

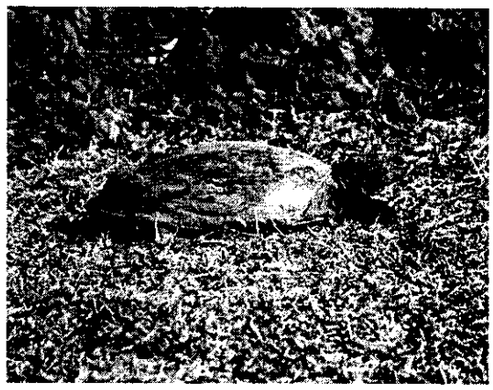
6.1. CRITICALLY ENDANGERED PLANT SPECIES:

Gugal: (*Commiphora wightii*)

Status: Our field survey in the proposed project area revealed that there is a critically endangered plant species present in the buffer areas. However, this plant was found with low density in the buffer area. This plant has high medicinal values and is facing the threats of extinction by over exploitation for commercial purpose (Silori et al., 2004; Joshi, 2002; GUIDE 2009) from Kutch. However, recently Gujarat Forest Department has accomplished a large scale project on plantation of *Commiphora wightii* in Gujarat. Through

this project thousands of plants were raised and planted in entire Kutch region. This project has improved the number and density of the species in the region.

Impacts: The construction of copper refinery plant and allied industrial development operations would involve large scale removal or vegetation, excavation, material handling, could result in habitat degradation due to air borne dusting from copper plant, effluent discharge, pollution load, movement of vehicle etc. can potentially affect the density and distribution of this species in the buffer area.



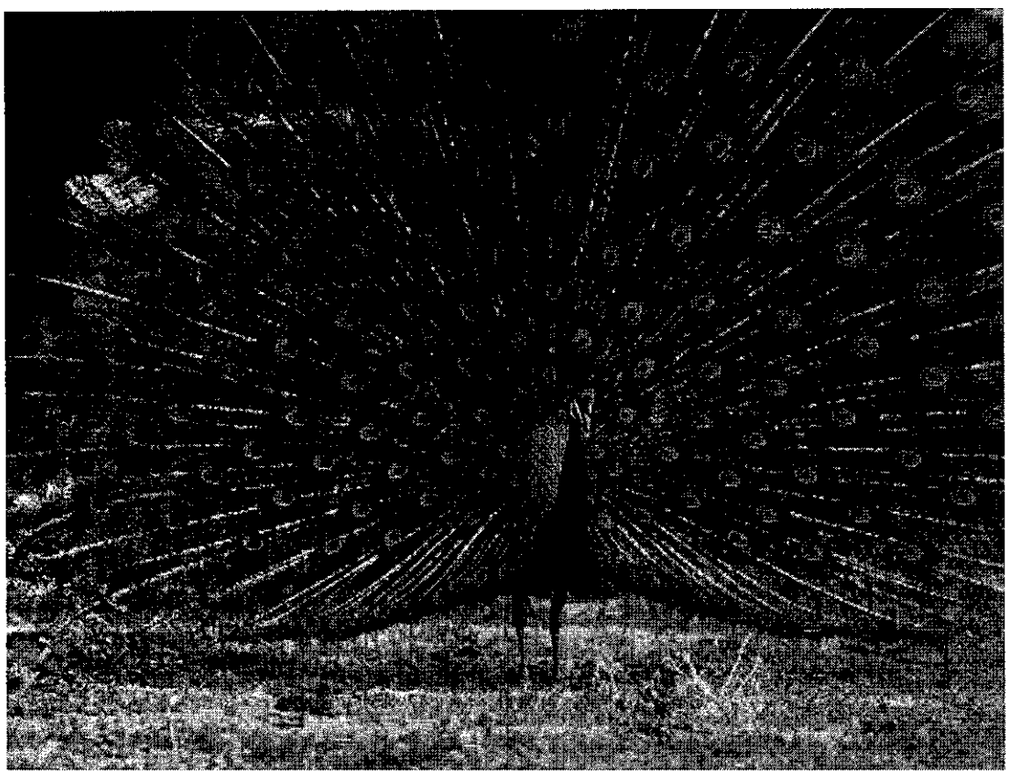
Recommendations: AEL shall put in place all kinds of pollution control measures so that the surrounding vegetation is not degraded and this species along other plants survive normally in the study area. AEL shall carryout comprehensive biodiversity monitoring at regular intervals in order to check impact of their project activities on surrounding area and special emphasis shall be given to this species. It is also recommended that company should take up plantation of *Commiphora wightii* by involving local forest department, which has vast experience of carrying out plantation of this specialized plant species. Since removal of vegetation would be done in the first year of commencement of the project, it is advised that the plantation shall be carried out in the first year itself. Since the plant is slow growing, it is recommended that a total of 10.0 ha. of *Commiphora wightii* plantation shall be done in the first year itself. Rest of the time Kutch East Forest Division would carry out maintenance of the plants. This plantation shall be carried out in the reserved forests, unclassed forests or roadside areas as found suitable by the Kutch East Forest Division.

6.2. SCHEDULE-I FAUNA

Among the fauna, we reported total 8 animal species. As mentioned above, the faunal wildlife species include 2 species of Reptiles, 5 species of birds and 1 species of mammal.

6.2.1. REPTILE/ INDIAN FLAP SHELL TURTLE/ MONITOR LIZARD

Status: During our study this species of reptile was recorded from the small village ponds in the study area. The species is resident and breeding in the buffer areas. The Indian Flap shell Turtle (*Lissemys punctata*) is a freshwater species of turtles are widespread and common in the South Asian provinces. They are listed as Schedule-I species under Wildlife Protection Act 1972 and as Least Concerned as per IUCN threat categories. Monitor Lizard is also one of the reptile's species which is found in the study area.



Impacts: Since this species is an aquatic and cold blooded, it may be subjected to impacts related to water pollution and hydrological impacts arising due to project activities. These may include degradation of water sources, soil characteristics, choking of drainages etc. This species is otherwise not hunted or eaten by the people. Therefore, changes of degradation of overall aquatic habitat qualities in the buffer area are likely to affect these species and their distribution.

Recommendations: AEL shall put all kind of pollution control measures in place so that surrounding area ecological conditions are not degraded. During construction it shall be seen that no drainage, ponds etc. are damaged or altered. AEL shall carryout comprehensive biodiversity monitoring at regular intervals in order to check impact of their project activities on surrounding area and special emphasis shall be given to

monitoring of surface (drainage, check dams, ponds) water and wetlands in the buffer area.

6.2.2. BIRDS/ INDIAN PEAFOWL

Status: The Indian Peafowl (*Pavo cristatus*) is a resident breeder in the Indian subcontinent. The bird was justifiably declared as the national bird of India in year 1963 due to its 'flagship' value founded on its glorious position in mythology and its widespread distribution in the country.

The species is found in dry semi-desert grasslands, scrub and deciduous forests. It forages and nests on the ground but roosts on top of trees. It eats seeds, insects, fruits, small mammals and reptiles. The Indian Peafowl is a ground nesting bird and it lays a clutch of 4-8 eggs which take 28 days to hatch. The eggs are light brown and are laid every other day usually in the afternoon. The male does not assist with the rearing, and is illegal. Poaching of peacocks for their feathers and poisoning by feeding on pesticide treated seeds are known threats to wild birds.The collection of tail feathers is only allowed if shed by the bird. The Indian peafowl is under various threats that

include the demand for feathers and wild meat, conflict with farmers during cropping season, increased use of chemical fertilizers and pesticides and habitat degradation.

Impacts: Our field study reported presence of Indian Peafowl in the buffer areas of project site. The species was observed in the buffer area of 10 km radius particularly near human habitations, villages and agriculture fields. Since our study reported presence of Indian Peafowl in the buffer area, its possibility of nesting in buffer area could not be ruled out. Since Indian Peafowl is a ground nester, several project activitie can have adverse impacts on their nesting grounds such as pollution, degredation of soil and vegetation from surrounding ara and in the forest areas. Direct disturbance by presence of people, vehicle, their noise, vibrations, lights etc. can potentially disturb most of the bird species.

Recommendations: following actions for the conservation and protection are suggested in wildlife conservation action plan to reduce impacts of project related activities on the species. Based on our field observation on the distribution, behavioral ecology, conservation need, and envisaged impacts of proposed copper refinery project, we identified several species specific actions that would help reduce the impacts of project on Indian Peafowl as under.

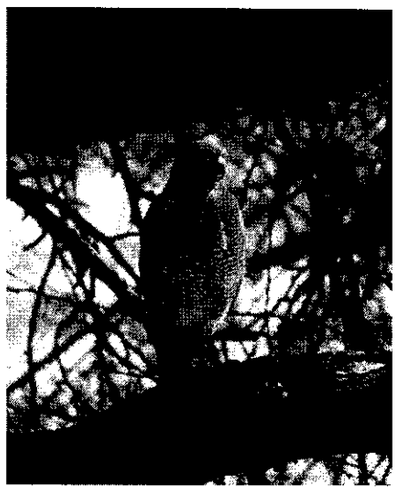
i. A rapid survey for the breeding population of Indian Peafowl during their nesting season shall be carried out in pre-monsoon season by wildlife experts so as to ensure that no nesting of the species is present in and around project or corea area.

ii. Since Indian Peafowl is a ground nesting bird, construction activities could disturb their nesting activities. Therefore if nesting of peafowl is found, in core area, construction activities should not be carried out in that particular block. Construction activities should resume only after egg hatching is completed and the fledglings leave the nest.

iii. Avoid vehicle movement in the area where nesting is found. The movement of vehicles or humans shoul be prohibited in vicinity of the nesting area.

iv. Electric lines within the project area and outside the project area shall be designed to minimize the potential for electrocution of indian peafowl and other such large birds.

v. Lightings within the project area could potentially deter the species presence. Therefore, AEL shall ensure that minimum illumination comes out from the project area. This can be done by adjusting the angles of the light sources and using low intensity focused bulbs inside the project area.



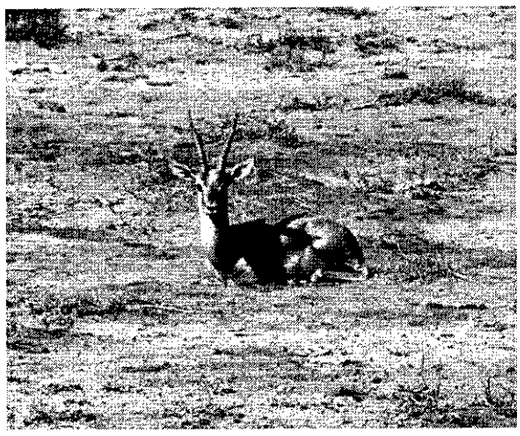
vi. Tree Plantation shall be carried out by AEL in the surrounding villages and schools etc. in the buffer area. This would help the species and provide them much needed roosting place.

vii. Staff involved in construction and operation activities shall be trained and made aware of Indian Peafowl's status as National Bird of India, and Schedule-I species protected under Indian Wildlife Protection Act 1972. This is important because if there any casualties of the species are found then they should report to the project authorities and the local forest department to carryout further necessary actions.

6.2.3. BIRDS/ SCHEDULE-I RAPTORS

Status: Total 3 bird species i.e. terrestrial Raptors belonging to Schedule-I of Wildlife Protection Act 1972 are reported from the study area. These species are Black shoulder kite, Marsh Harrier, Shikra. Of these 3 species of Raptors, none are reported from the core area and all 3 are reported from buffer area. The species of Harriers are migratory bird species whereas, rest of the species are resident species. Most of the raptor species are recently added to Schedule-I list through amendment made in year 2013.

Impacts: These 3 species of terrestrial raptors are predators and occupies tertiary consumers positions in the food chain and ecological pyramids. Therefore, any change in primary productivity would affect their distribution, density and population in the region. Therefore, project activities resulting in air, water and noise pollution, degradation of vegetation would potentially affect the habitat of these bird species and their population in the study area. Moreover, direct disturbance by presence of people, vehicle, their noise, vibrations, lights etc. can potentially displace most of the raptors species from the project area and its immediate surroundings.



Recommendations: It is recommended that AEL shall take utmost care in controlling dust, fugitive emissions using state of the art technologies and put in place all types of pollution control measures during construction and operation phases which would ensure minimum degradation of surrounding vegetation, forest area vegetation and waterbodies. Minimize vehicle movements around the project areas. Adjust lightings within core area and ensure minimum illuminations spreads outside the project area. Keep all the machineries maintained so that minimum noise and vibrations are generated in the surrounding area. Since most of the raw materials and products are to be carried through conveyer belts the impact related to vehicle movements would be low.

6.2.4. CHINKARA (*Gazella bennettii*)

Status: The important herbivore present in the buffer area is Chinkara which is protected as Schedule-I species in Wildlife Protection Act 1972. During our survey, we reported presence of Chinkara through direct sightings in the buffer area in the study area. Indian gazelle is a shy animal and avoids human habitation. It stands at 65 centimetres and weighs about 23 kilograms. It can go without water for long periods and can get sufficient

fluids from plants and dew. Although most individuals are seen alone, they can sometimes be spotted in groups of up to four animals. It lives in grasslands and desert areas in India. Its population is on the decline due to it being hunted for game. Narayan Sarovar Wildlife Sanctuary and its surrounding areas are known for Chinkara population. The sanctuary is also known as Narayan Sarovar Chinkara Sanctuary. The species is common in landscape of Kutch and North Gujarat. The species is listed as Schedule-I in Wildlife Protection Act 1972 and as Least Concerned by IUCN. The species needs safe, undisturbed arid semi arid plains with open arid sparse vegetation.

Impacts: This mammal species is likely to be using surrounding area for their feeding and breeding. They are also likely to be using waterbodies in the buffer area for their requirement of water. The impacts of copper refinery and allied development activities on herbivore are likely to be direct as they are primary consumers in the eco-system. Degradation of soil, vegetation and habitat due to chronic pollution loads the species would lose its feeding ground and breeding area. Moreover, the direct loss of habitat worth the core area is also an irreversible loss to the species. Therefore, changes in overall habitat qualities in the buffer area are likely to affect these species. The direct disturbance to these species by vehicle traffic, poaching by workers, and human intrusion in wildlife habitat is also issue of some concern.

Recommendations: It is recommended that AEL shall comply with all the pollution control and other conditions imposed in the environmental clearance by MoEF&CC. Compliance of all the conditions in environment clearance by MoEF&CC would take care of major issue of habitat degradation for the species. AEL shall instruct their own staff members and workers not to indulge in chasing or killing of Chinkara in the study area. AEL

shall also support forest department in conducting awareness of local people towards wildlife conservation and law reinforcement and anti poaching activities in the study area. AEL shall support forest department in installing sign boards on roads and strategic locations of villages informing prohibition of killing, poaching etc. under wildlife protection act 1972.

6.3. IMPACT – MITIGATION MATRIX & CONSERVATION PLAN

Based on our observation, literature review and consultation with local people, and NGO, we formulated following impact *vs* mitigation matrix (Table-6.2). The matrix is created using information and data collected during our field visits and the information available in public domain. We calculated distances of sensitive ecological receptors such as protected areas, their eco-sensitive zones, biodiversity heritage sites, important bird areas, mangrove, reserve forests, wetlands, rivers etc. from project core areas. Professional judgements and recommendations are made based on our experiences and the parameters used for predicting impacts.

6.4. WILDLIFE MITIGATION MEASURES & RECOMMENDATIONS

Based on our field study, information collected and consultation with project proponent, local community etc. we recommend following mitigation measures as self regulatory, monitoring and compensatory measures for protection, conservation and betterment of wildlife and ecology in the surrounding area of project site.

6.4.1. REGULATORY MITIGATION MEASURES & RECOMMENDATIONS

i. Since project deals with heavy metals, acids and hazardous materials, it is recommended that strict control on fugitive emission, dust pollution shall be carried out using state of the art methods and technologies. Maximum area under intensive use shall be made of hard floor. Professional dust suction system from the area under intensive use shall be placed.

3273

Table-6.2: General Impacts vs. mitigation matrix & Conservation plan.

Issue		Status	Impacts	Mitigation
Ecosystems	Protected Areas	All the protected areas of Kutch are located beyond 70 km from the proposed project area. Marine National Park and Sanctuary areas are located beyond 30 km south of the proposed project in Gulf of Kutch.	No impacts are envisaged, as these areas are located at greater distances.	• Nil
	Eco-sensitive zone	No eco-sensitive zones of any Wildlife Sanctuary or Naitonal park are located within 30 km from the proposed project area.	No impacts are envisaged, as these areas are located at greater distances.	• Nil
	Wetlands & waterbodies	No major inland wetlands are located within study area. Marine wetlands include Kotdi creek (0.5 km, S), Baradimata creek (4.0km SE), Gulf of Kutch (3.9 km, S), Seasonal drainage/rivers are Nagavanti Nadi (4.7 km, E) and Phot Nadi (8.7 km, ENE), Khari Nadi (1.9 km, W), A drainage known as Dhaneshri Nadi flows through the western part of the project site and it drains into Kotdi Creek system. Small check-dams and nallah are present in the study area at distance.	• Kotdi creek system has sparse and dense mangrove growth on both sides. • Dhaneshri river/drainage may carry spilled out pollutant load from the project area to the mangrove eco-system of Kotdi creek. This may increase heavy metal toxicity in mangrove habitats. • If dusting, fugitive emission are not controlled, it could cause major damage to mangroves.	• Therefore, it is recommended that Dhaneshri River should be trained in such a way so that it does not carry pollutants with runoff from the project area. • Install state of the art technologies so that pollution from the project area remains within applicable standards. • Check health of mangrove eco-system at regular intervals. • Prepare a comprehensive mangrove conservation plan for Kotdi and Baradimata creek system's mangroves located in the study area.

2973

	Important Bird Areas	Banni & Naliya grasslands are two major IBAs of Kutch	No impacts are envisaged, as these IBAs are located far away, 70 km from the project site.	Nil
	Forest Area	Reserve Forest, Unclassed forest areas are located adjacent to proposed project area. In fact part of the project area would be located on diverted Forest land of Siracha village. The south of the proposed project area there are mangroves which are also declared as reserve forest areas by state forest department. Navinal reserve forest area is also located at 500 mtrs distance only from the proposed project area in east direction.	Direct loss of forest land worth 102.39 ha. Pollution loads from project activities could potentially degrade remaining forest land located in Siracha village, Navinal forest area and mangrove reserve forests. As per EIA/air modelling, it is learnt that 2.2 km North-East direction there will be impacts of air pollution. This means it would affect reserve forest area of Navinal. As per literature survey, Navinal area has presence important native species of plants. This forest area would be affected due to chronic air pollution impacts.	• Compensate loss or damage to Forest area due to pollution by taking up plantation of native species. • Construct tall wall around project boundary so that dusting, possibility of fire etc. are minimized. • No roads or trespassing shall be done by staff or workers through Forest area. • No collection of fuel wood from forest land shall be allowed. • No worker camps, dumping of solid waste, over burden inside forest land shall be allowed. • Fire and safety precautions shall be in place during construction and operation phases. • Green belts as per conditions of Environment Clearance shall be created using native species of plants in the periphery of project area. • Install state of the art technologies so that pollution from the project area remains within applicable standards.
	Mangroves	Mangroves are located at 170 mtrs from the project boundary in Kotdi and Baradimata creek systems on the coast of Gulf of Kutch	• Kotdi creek system has sparse and dense mangrove growth on both sides. • Dhaneshri river/drainage may carry spilled out pollutant load from the project area to the mangrove eco-system of Kotdi creek. This may increase heavy metal toxicity in mangrove habitats.	• It is recommended that Dhaneshri River should be trained in such a way so that it does not carry pollutants with runoff from the project area. • Ensure that strict pollution control measures are implemented in the project. • Check health of mangrove eco-system at regular intervals. • Prepare a comprehensive mangrove

			• If dusting, fugitive emission are not controlled, it could cause major damage to mangroves.	conservation plan for Kotdi and Baradimata creek system's mangroves located in the study area. • Take up mangrove restoration and afforestation activities in consultation with Kutch East forest division.
	Ramsar Site	There are no Ramsar Sites in Kutch district.	Nil	Nil
Flora	General Vegetation	This area has native vegetation representative of semi arid zones. These include typical tropical thorn forest area comprising of *Acacia, Salvadora, Caparis, Ziziphus, Commphora species.*	There will be irreversible loss of native vegetation from the core area i.e. 256.58 ha. The native vegetation from the immediate surroundings of the proposed project site would also be affected due to pollution load.	• Remove minimum vegetation from core area. • Install state of the art technologies so that pollution from the project area remains within applicable standards. • Vehicle movements shall be minimum. • No vegetation shall be cut by workers from surrounding area. • No collection of fuel wood from surrounding land shall be allowed. • Fire and safety precautions shall be in place during construction and operation Thick green belts shall be created using native species of plants in the periphery of project site.
	Important plant Species	*Commiphora wightii is* an important plant which is listed as Critically Endangered by IUCN. This plant is present in core and buffer area.	This important plant species would be affected in the surrounding area due to air and water pollution loads from project activities. As per EIA/air modelling, it is learnt that 2.2 km North-East direction there will be impacts of air pollution. Chronic air pollution would affect plant growth in this area.	• Thick green belts shall be created using native species of plants in the periphery of project area. • In order to compensate for the potential damage/degradation of *Commiphora wightii* habitats AEL shall carry out plantation through Kutch-East Forest Division, Bhuj.

Fauna	Threatened or Endemic fauna Species	No threatened fauna species are reported from the study area during survey. i.e. core or buffer area during study.	Though, not reported during the present study, there may be presence of these species in future. Degradation of overall habitat could affect these species.	• Install state of the art technologies so that pollution from the project area remains within applicable standards. • Thick green belts shall be created using native species of plants in the periphery of project site. • Carryout biophysical monitoring of intertidal zone located south of project area at every 6 months.
	Schedule-I Reptiles	The Indian Flap shell Turtle (*Lissemys punctata*) is present in ponds and small wetlands of buffer area. Indian Monitor Lizard is present in agriculture, open scrubland and thorny bushes in the project area.	Degradation of overall terrestrial and aquatic habitat qualities in the buffer area are likely to affect these species and their distributions.	• Install state of the art technologies so that pollution from the project area remains within applicable standards. • Monitoring of biodiversity including these species and take corrective measures if needed. • Carry out habitat improvement activities through forest department in surrounding reserve forest areas, which would ensure their long term survival in the region.
	Schedule-I Birds	Indian peafowl and 5 Schedule-I bird species i.e. terrestrial Raptors are present in study area.	Pollution load, overall habitat degradation, direct loss of habitat worth 256.58 ha. and direct disturbance due to vehicle movements, illuminations and project activities could displace and disturb these species from the immediate surroundings of the project area.	• Install state of the art technologies so that pollution from the project area remains within applicable standards. • Maintain machinery so minimum vibrations and noise is controlled within the applicable standards at the boundary of the project. • Adjust lightings in the core area so minimum illumination spread outside core area. • Thick green belts shall be created using native species of plants in the periphery of project boundary. • Cary out tree plantations in surrounding villages to augment habitat for Indian Peafowl and other schedule-I birds species.

			• Monitor biodiversity including bird species and take corrective measures accordingly. • Carryout habitat improvement activities through forest department in surrounding reserve forest areas, which would ensure their long term survival in the region.
Schedule-I Mammals	Only one species of Schedule-I mammal is reported i.e. Chinkara from the study area. None from core area. It is mostly reported from the reserve forest areas within the study area.	Overall degradation of habitat due to pollution. Direct disturbance due to Noise, vibration due to vehicle movements could displace or deter this species. Lighting and illumination could displace the species from surrounding area. Hunting, chasing, killing by workers, road kills etc. are also envisaged.	• Install state of the art technologies so that pollution from the project area remains within applicable standards. • Maintain machinery so minimum vibrations and noise is generated. • Adjust lightings in the core area so minimum illumination spread outside core area. • Thick green belts shall be created using native species of plants in the periphery of project area. • Monitor biodiversity including mammal species and take corrective measures accordingly. • Provide funds for habitat improvement activities by the forest department in surrounding reserve forest areas, this could ensure their long term survival in the region.
Wildlife Corridors	No wildlife corridor is identified under any legal framework in the study area.	Nil	• Nil

29977

ii. Ambient noise pollution and vibrations during construction and operation phases of copper refinery plant shall be within limits of the standards mentioned.

iii. Plantation of thick green belt on periphery of the project site shall be created using native and hardy tree species.

iv. Ensure no movement of vehicles or people through Forest Areas located immediate north (Siracha) and east (Navinal) of proposed copper refinery plant area.

v. Ensure zero discharge of waste water from the project site into surrounding area.

vi. Ensure safe passage of runoff through drainages located within and nearby the project area. It is recommended that a seasonal drainage/river (Dhaneshri River) should be trained in such a way so that it does not carry pollutants from the project site into mangrove eco-system located immediate south of the project boundary.

vii. Ensure no dust, fly ash, sediments, or any raw materials spill out from project areas and flow into nearby drainage, forest areas during the operation phase of the project.

viii. AEL shall ensure that their construction workers and other staff during construction or operational phase shall not be involved in poaching and hunting activities of birds, reptiles or mammals around the project site.

ix. Implement state of the art technologies to control pollution caused form the proposed project.

x. No trespassing or vehicle or people shall be allowed through, surrounding forest area or the mangrove eco-system. This shall be instructed to the workers and staff in advance.

xi. No workers camps shall be established within the surrounding forest area. This shall be instructed to the workers and staff in advance.

xii. No resources (i.e. fuel wood, stones, sand, soil etc.) from the surrounding forest area shall be collected by staff or workers. This shall be instructed to the workers and staff in advance.

xiii. No workers or staff members shall be involved in poaching or killing of any wild animals throughout the project life cycle. This shall be instructed to

the workers and staff in advance and sign boards to this effect within project area.

6.4.2. MONITORING MEASURES & RECOMMENDATIONS

xiv. AEL shall regularly monitor health of the forest areas (Siracha and Navinal village), mangrove eco-system (Kotdi and Baradimata creeks) and biodiversity in the study area.

xv. AEL shall carryout annual monitoring of mangrove eco-system in Kotdi and Baradimata creeks. Details of monitoring are provided in mangrove conservation plan.

xvi. After commencement of the project AEL shall carryout comprehensive ecological & biodiversity monitoring at every 2 years for 10 years. The monitoring shall include status of flora, fauna and health of reserve forests and mangrove eco-system present in the immediate proximity of the proposed project site. In case any changes, damage is reported to them AEL shall take necessary corrective measures accordingly. AEL shall bear the cost of third party monitoring.

xvii. Overall official monitoring would be carried out by Kutch-East Forest Division, Bhuj. AEL shall pay the administrative and monitoring cost for the same.

6.4.3. COMPENSATORY MEASURES & RECOMMENDATIONS

xviii. In view of the probable impacts of construction and operation of copper refinery project on mangroves of Kotdi and Baradimata creek areas, AEL shall chalk out Mangrove Conservation plan.

xix. In order to compensate for the potential damage/degradation of *Commiphora wightii* habitats AEL shall carry out 10.0 ha. of plantation through Kutch-East Forest Division, Bhuj.

xx. In view of the distribution of species of higher conservation significance and the Schedule-I species, in the study area particularly within the reserve forests around the project area, it is recommended that AEL shall financially support wildlife habitat improvement activities being carried out by Kutch East Forest Division.

6.5. IMPLEMENTATION OF MITIGATION PLAN

- Since the project is located away from protected area and their eco-sensitive zones, most of the wildlife mitigation recommendations are self regulatory for user agency, therefore the implementation of these mitigation measures shall be carried out by the user agency (AEL) through their own staff and CER budget.
- A special emphasis on ecological conservation shall be given by extending special responsibility to senior environment authority within the management of the proposed project authority. A senior ecologist shall be employed / consulted on regular basis to oversee ecological/wildlife conservation activates under CER. The senior personal responsible for the conservation of ecology shall report directly to the head of the organization.
- Substantial budget shall be allocated to carryout ecological conservation activities by the user agency (AEL).
- Any additional conditions towards wildlife mitigation activities by any of the Environment Appraisal Committees at state or central levels or by the Forest department shall be complied with.
- Annual Compliance report for these activities shall be submitted to Kutch West East Forest Division, Bhuj, Gujarat.

6.6. MONITORING OF MITIGATION & COMPLIANCES

Though, most of the recommendations are self regulatory for user agency, monitoring of these recommendations and other conditions imposed by various agencies towards wildlife mitigation measures shall be monitored by a third party agency. Third party monitoring would involve comprehensive ecological/biodiversity study at interval of 2 years for 10 years. These studies would be carried out to evaluate long term impacts of the proposed project activities on the wildlife, biodiversity, ecology and forest areas present in the 10 km periphery of the project site. Therefore, as per guidelines issued by the Principle Chief Conservator of Forests, Wildlife dated 13th August 2018, user agency shall allocate up to 5% of the total cost of mitigation plan as third party

monitoring cost. Total Rs. 443.5 Lakh shall be allocated by the AEL for monitoring of mitigation plan for the period of 10 years.

Since the area falls under the jurisdiction of Kutch East Forest Division, the overall official monitoring of the implementation of mitigation plan would be carried out by the Kutch East Forest Division, Bhuj. Therefore, as per guidelines issued by the Principle Chief Conservator of Forests, Wildlife dated 13th August 2018, user agency shall allocate and pay the monitoring and administrative cost to the forest department. For carrying out overall monitoring activities, user agency shall pay monitoring and administrative cost to the authorities of Kutch East Forest Division.

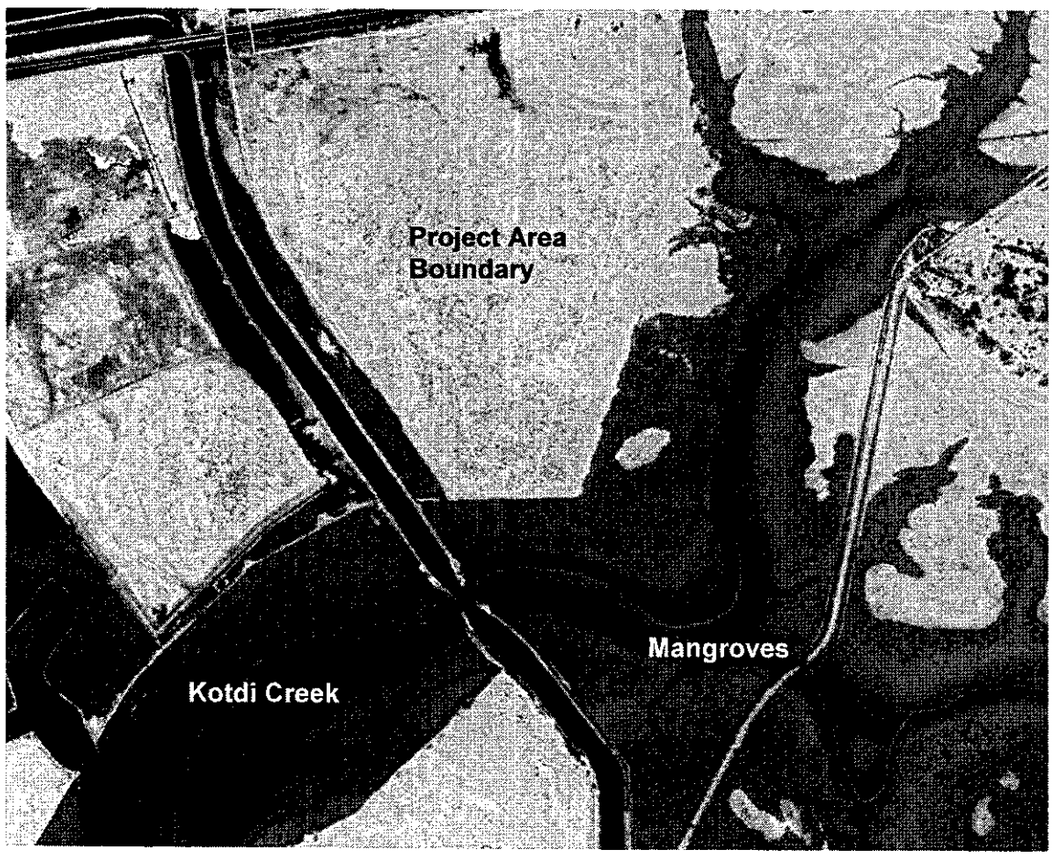
7. MANGROVE CONSERVATION PLAN

7.1. Background

M/s. Adani Enterprises Limited (AEL) intends to set up a Greenfield copper refinery project of 1.0 MTPA (10 LTPA) capacity which would include facilities like copper smelter, sulphuric acid plant, copper refinery, continuous cast copper wire rod plant, precious metal recovery plant, phosphoric acid plant, aluminium fluoride plant, effluent treatment plant, utilities storage of water and fuel, etc. with the state of the art environment friendly technology. These facilities would be located in 256.58 ha. of land which include 154.19 ha of APSEZ land and 102.39 ha. forest land. The Gulf of Kutch sea coast is located at 3.9 km south from the proposed project site.

As per Environmental Impact Assessment (EIA) Notification dated 14th September 2006, proposed project falls under category-'A' of project activity 3(a) and requires prior Environmental Clearance (EC) to be obtained from Ministry of Environment, Forest & Climate Change (MoEF&CC) before the commencement of ground activity. The application for prior EC for the proposed project has been submitted to MoEF&CC Terms of Reference (TORs) has been issued by MoEF&CC. The proposed industry is for handling heavy metals and hazardous chemicals which could lead to severe impacts on the surrounding environment and health of eco-systems if not done carefully. In view of the nature of proposed industry and processes involved, it is imperative to consider impacts of such industry on the surrounding eco-systems and take appropriate mitigation measures. Since mangrove eco-system is present south of project boundary, an action plan is proposed to protect and conserve the same.

7.2. Importance of Mangroves



In general, mangroves are known to provide multifold eco-system benefits to mankind. Mangrove ecosystems represent natural capital capable of producing a wide range of goods and services for coastal environments and communities and society as a whole. Some of these include protection of coast from cyclones and disasters, resistant against coastal erosion, carbon sequestration, provide fodder, timber, honey etc. Improved fish production in area where mangroves are present is also reported by many studies. Mangroves are

believed to be the bio-filters of pollutants. Most importantly it provides substratum to a wide range of associated micro& macro flora and fauna which in turn constitutes a dynamic and functional mangrove eco-system that provides multifold socio-economic and environmental benefits to mankind.

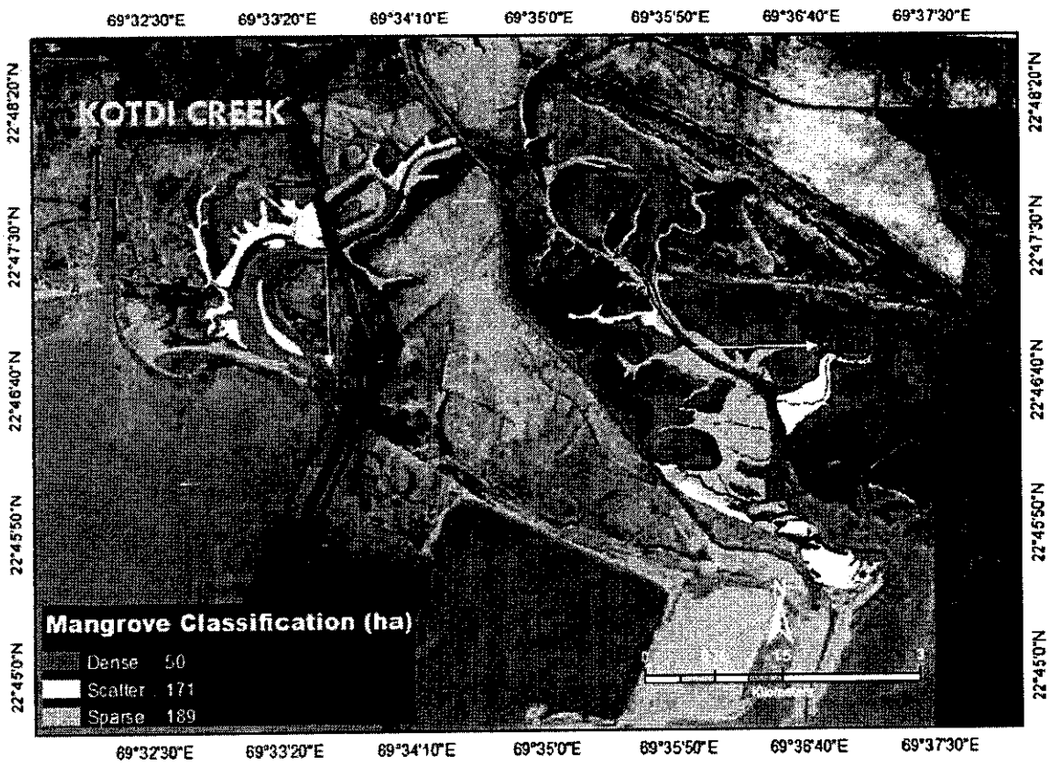
7.3. Status of Mangroves Around Project Site

The baseline information suggests that the coastal area of Tunda, Navinal, Shiracha, Jarpara and Tragdi villages have patches of scattered, sparse and dense mangroves. Most of the mangrove areas are located in the notified reserve Mangrove Forest areas of Navinal, Shiracha and Jarpara village coasts. Closest mangrove distribution is located at 170 meters South form the project area on the bank of Kotdi creek (Plate-4.1, Map-4.2). The mangrove on the banks of Kotdi-I, Kotdi-II, Baradimata and Tragdi creeks fall within 10 km radius of the proposed project area. The mangroves of Kotdi–I and Kotdi-II creeks are closest mangrove (Map-7.1, Map-7.2).

Map-7.1: Mangroves of Kotdi Creek south of Project boundary.

There are total 3 species of mangroves present in the total three species of mangroves present these include *Avicennia marina, Ceriops tagal and Rhizophora mucronata*. A study carried out by National Centre for Sustainable Coastal Management (NCSCM), Chennai in year 2018, the total mangrove cover in Kotdi-I and Kotdi-II creeks was about 410 ha. out of which dense mangroves occurred to the extent of only 50 ha (12%), followed by sparse mangroves, distributed in 189 ha. The scattered mangrove covered an area of 171 ha. (Map-7.1). The above mentioned study reported an increase of 30.0 ha between year 2011 and 2016. A study by Thivakaran and Sawale (2016) reported 47 species of macrofauna in the Mundra mangrove eco-system. Total 12 species of gastropods, 14 species of crustaceans, 9 species of bivalves, 8 species of polychaetes and 4 species belonged to the category "others". Increasing spread of mangrove area and high species richness of macrofauna suggests healthy and dynamic condition of mangrove ecosystem in this area.

Map-7.2: Status of mangroves of Kotdi – I & Kotdi – II creek systems in 2016-17. (Map source: study by NCSCM 2018).



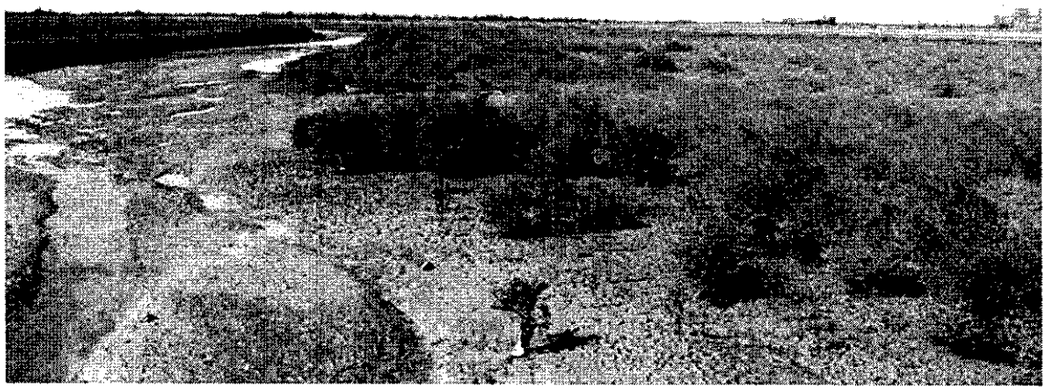


Plate-7.1: Mangroves of Kotdi-I creek.

7.4. Potential Impacts on Mangroves

Based on our survey and existing literature it is established that there are patches of scattered, sparse and dense mangroves located close to southern boundary of project area. The mangroves are located in Kotdi-I, Kotdi-II, Baradimata creeks. Since proposed project would involve large scale handling of heavy metals, hazardous chemicals and hazardous processes it could potentially affect mangroves located in the study area. Therefore, these mangroves which are located south of the project site are at higher risk of damage due to following impacts.

Air pollution: Though, the predominant wind direction is from south-west in the region, there are still chances of mangrove located on immediate southern boundary being impacted due to its close distance from the project site. Chances of damage to mangroves by fugitive emissions are high. The main sources of air pollution from the project will be from the processes and stacks. The pollutants from the plant include sulphur dioxide and particulate matter. Suspended particulate matter produced during construction and operational phases of the copper refinery plant would deposit in the surrounding mangrove ecosystem. Their direct deposition on mangrove could cause loss of chlorophyll content in leaves, arrest of photosynthesis process, leaf injuries resulting in restricted growth and regeneration of mangrove plants. Toxic metal fumes could also increase heavy metal toxicity of the mangrove eco-system.

Water pollution: There is a drainage known as 'Dhaneshri Nadi' flows through the western part of the project site and it drains into Kotdi Creek system. Kotdi creek system has sparse and dense mangrove growth on both sides. Therefore, if the Dhaneshri river/drainage is not trained suitably, it may carry spilled out pollutant load from the project area to the mangrove eco-system of Kotdi creek. This may increase heavy metal toxicity to mangrove eco-system and its components. Among the various types of pollutants released from such industry, heavy metals are one of the most serious pollutants owing to their toxicity, persistence and bioaccumulation problems (Macfarlane & Burchett, 2002). The metal contamination is a major environmental problem as the metals in contaminated sediments may accumulate in the various organisms of the estuarine ecosystem and ultimately enter the food chain, thereby affecting the human well-being (Shakeri & Moore, 2010). The concentrations of heavy metals in the sediments usually exceed that of the overlying water (Zabetoglouet et al., 2002) and the high concentrations of these metals in water and sediments affect both plants and animals (Doganlar & Atmaca, 2011). Chronic heavy metal toxicity could prove to be lethal for a range of fauna present in the mangrove habitat and affect the overall function of mangrove eco-system.

7.5. MITIGATION MEASURES

In view of the above mentioned status, importance and role of mangroves and potential impacts of proposed copper refinery plant on mangroves, it is recommended to take up following measures so that the mangroves are not harmed and their health and spread improves in the study area.

7.5.1. Mitigation of Air Pollution:

- It is recommended that a tall wall around the project boundary be constructed so that dusting is controlled during construction and operation phases.
- Thick green belt around the project boundary shall be created so that particulate matters are arrested.
- State of the art technology for arresting dust pollution shall be implemented for controlling different types of pollutions from various sources in the plant areas.

7.5.2. Mitigation of Water Pollution:

- State of the art water pollution control measures shall be in place including treating industrial effluents with heavy metals.
- Train Dhaneshri river/drainage in such a way so that it does not carry spilled out pollutants from the project area to the mangrove eco-system of Kotdi creek.
- Do not release untreated sewage or effluents in to the creek areas having mangroves.

7.5.3. Plantation of Mangroves to Mitigate Heavy Metal Toxicity

Mangroves are considered as best natural bio-filters of pollutants. Mangrove trees are reported to tolerate high levels of heavy metals (MacFarlane, 2007) with *Avicennia* species exhibiting greater tolerance and accumulative properties to numerous metals than other mangrove species (MacFarlane and Burchett, 2002). The inorganic industrial waste composed basically by heavy metals do not degrade and although they can be diluted in the long run they will always be responsible for the environmental damage even if the source has ceased to operate. Mangroves have natural ability to act as a sink of anthropogenic and industrial pollutants. Mangroves are also known to arrest and carryout bioremediation of certain pollutants in local environment. Mangroves not only act as a sink or transfer the pollutants but they also oxidize the metals present in the sediment by exuding oxygen into the anoxic soil through aerial roots. Mangrove wetlands are therefore considered as low cost waste disposal site.

It is in this context, not only preservation of Kotdi and Baradimata creek mangroves are important but there is a need to increase mangrove spread in this area so that it can mitigate the impacts of proposed industry on marine water and their biota. Therefore, it is recommended that AEL shall take up intensive mangrove plantation drive particularly on the bank of Kotdi-I, Kotdi-II and Baradimata creek systems. Total 50 ha. of plantation every year shall be taken up for 10 years period. It is recommended that mangrove plantation shall be carried out by Kutch East Forest Division as the area is under their jurisdiction and the staff has vast experience in mangrove plantation and management.

7.5.4. Monitor Health of Mangroves:

- It is important to regularly check the health of mangrove eco-system located in the Kotdi-I, Kotdi-II and Baradimata creek systems.
- It is recommended to carryout monitoring of heavy metal contents in the sediments and mangrove plants (root & stem) at every 6 months intervals in the Kotdi-I, Kotdi-II and Baradimata creek systems. A minimum of 20 samples of sediments shall be collected and analyzed each time. The samples shall be collected at every 200 to 500 meters distances starting from northern most part of creeks to southern area.
- It is recommended to monitor the spread of mangroves in the Kotdi-I, Kotdi-II and Baradimata creek systems. This shall be done at the interval of every 2 years using standard high resolution satellite imageries and Remote-sensing & GIS techniques.
- The monitoring of floristic structure of mangrove stock shall be carried out annually to check if there are changes in its composition in terms of heights, girth and regeneration classes of Kotdi-I, Kotdi-II and Baradimata creek systems. This would enable us to check if the mangroves are degrading or healthy.
- It is recommended to monitor diversity and density of mangrove associated flora as well as macrofauna annually. This would help us monitor the functioning of food chains and food webs operating in mangrove eco-system of Kotdi-I, Kotdi-II and Baradimata creek systems. An initial baseline data shall be generated on this prior to commencement of the construction of the proposed project. It is recommended to fix the location of sample plots and follow the same locations for subsequent monitoring efforts.
- It is recommended that the biological parameters of the mangrove eco-systems i.e. spread of mangroves, floristic structure, diversity, density, as well as diversity of mangrove associated flora and fauna shall be monitored by and independent NABET accredited experts.
- The samples collected from the mangrove plant and mangrove habitat sediments shall be analyzed only through NABL accredited laboratory.

7.5.5. Indicators for Monitoring of Mangroves.

Following are the indicators for monitoring of conservation plan. These indicators shall be monitored and the effectiveness of mangrove conservation plan shall be determined (Table-7.1.).

Table-7.1: Indicators for monitoring of Mangrove Conservation Plan.

No	Monitoring	Frequency	Negative Impacts	No Impacts
1	Spread of mangroves (area in ha.)	2 years	Decrease	Increase
2	Content of heavy metals in sediments	6 months	Increase	no increase
3	Content of heavy metals in mangrove plants	6 months	Increase	no increase
4	Mangrove stock structure (height, girth and regeneration classes)	Annual	Altered with decrease of area	Altered with increase area
5	Diversity of mangrove associate flora	Annual	Decrease	no increase or increase
6	Diversity of mangrove associated fauna	Annual	Decrease	no increase or increase

8. FINANCIAL LAYOUT

8.1. FINANCIAL ALLOCATION FOR WILDLIFE CONSERVATION ACTIVITIES

Following is the proposed budget estimated in consultation with forest department for 10 years towards wildlife conservation plan after approval from all statutory bodies permitting the project (Table-8.1).

Table-8.1: Proposed financial allocation for mitigation and conservation measures.

Sl	Activity	Implementing Agency	Duration Years	Rate/ Year (Lakh)	Total Amount (Lakh)
A	**Implementation Activities**				
1	Carry out Mangrove Plantation activities through Forest Dept. 50 ha. per year for 10 years. by AEL @ Rs. 30000/ha.	KEFD	10 years	15.0	150.0
2	Mangrove monitoring by third party	Project Proponent	10 years	10.0	100.0
3	Habitat improvement for Schedule-I species in Reserve Forest areas	KEFD	10 yeas	10.0	100.0
4	Carryout plantation of *Commiphora wightii* 10.0 ha. in the first years with maintenance (to be paid by AEL) @ Rs.95000/ha.	KEFD	First Year	9.5	28.5
5	Carry out tree plantation in surrounding villages for birds and Indian Peafowl	Project Proponent	10 years	1.0	10.0
				Subtotal	**388.5**
B	**Monitoring & Compliances Activities**				
7	Comprehensive ecological & Biodiversity monitoring by third party once every 2 years for 10 years after commencement of project	Project Proponent	@ 2 year for 10 years	5	25.0
8	Monitoring and administrative activity cost (5% to be paid by AEL to KEFD) to Kutch East Forest Division	KEFD	10	2.0	20.0
9	Documentation and preparation of Annual compliance report. 10 years	Project Proponent	Annual	1	10.0
				Subtotal	**55.0**
	Total (A+B) amount in Lakh				**443.5**

AEL= Adani Enterprise Limited

KEFD- Kutch East Forest Division

8.2. JUSTIFICATION FOR FINANCIAL ALLOCATION

The present wildlife conservation plan is prepared as part of Environment Clearance process for the proposed Greenfield Copper Refinery project by Adani Enterprise Limited. As per Environmental Impact Assessment (EIA) Notification dated 14th September 2006, proposed project falls under category-A" of project activity 3(a) and requires prior Environmental Clearance (EC) to be obtained from Ministry of Environment, Forest & Climate Change (MoEF&CC) before the commencement of ground activity. Terms of Reference for EIA preparation has been issued by MoEF&CC vide letter reference F.No.J-11011/113/2016-IA.II(I) dated 21st June 2016. Approved ToR No. 5(v) reads as "*Wildlife Conservation Plan duly authenticated by the Chief Wildlife Warden of the State Government for conservation of Schedule-I fauna, if any exists in the study area is to be prepared*".

The present document is a wildlife conservation plan prepared after primary and secondary survey of flora and fauna in the study area by a NABET accredited consultant. Since the present study identified several Schedule-I species of reptiles, birds and mammals, along with plant species of higher conservation significance (*Commiphorawightii* and Mangroves) in the study area of 10 km radius, several activities are proposed for their conservation and management.

The Stage-1 Forest Clearance has been obtained by the M/s APSEZ for 1576.81 Ha Forest Land in various patches. M/s APSEZ is under obligation to comply with all conditions of this Forest Clearance to secure Stage-2 clearance.

Copper project is proposed by separate company "M/s AEL" for which land shall be provided by M/s APSEZ as a clear land after all clearance. M/s AEL has obtained the TOR from MoEFCC for EIA of Copper Project and this Wildlife and Mangrove Conservation Plan is being prepared Condition No 5 (v) of the TOR received by M/s AEL. This conservation plan scope is to identify Schedule-I Fauna if any exist in the study area (10Km radius) and identify if may get impacted by the proposed copper project and prepare conservation plan for the same.

Proposed Copper project boundary does not fall inside any protected area or any ESZ of any protected area. There is guideline for wildlife conservation plan budget on the basis of percentage of total project cost only in case a project involves diversion of forest land in protected area which is not the case for Copper project of M/s AEL.

Hence, the conservation cost for wildlife and the mangroves for proposed Copper project has been arrived on the basis of scientific study and estimate for Schedule—I species in the study area (10 Km radius of copper project). Total Rs 443.5 Lakhs has been proposed as budget for conservation activities. Total project cost shall be Rs 10,000 Cr.

EAC OBSERVATION NO.-6

3295

EAC OBSERVATION

Storage arrangements made for the raw materials are found to be not adequate. Open storage of raw materials such as coal, limestone etc., shall be avoided.

REPLY:

Raw Material Storage Plan

Copper Ore Concentrate & Rock Phosphate:

Copper ore concentrate & rock phosphate will be unloaded from the vessel and transported to port storage godown by closed conveyor system. Godown at the port and plant will be a concrete walled with covered roof and paved with concrete. All the transfer points will be fitted with dust extraction/ suppression system to control dust emission.

A preliminary drawing is shown in **Annexure-6**.

Other Raw Materials in Copper Smelter:

Open storage of raw materials such as coal, limestone etc. will be avoided. Quartz sand, quartz chips, lime stone powder, crushed and powdered reverts will be received by covered trucks/ tippers and will be unloaded in the covered storage godown, which is paved with concrete and covered with roof. All the transfer points will be fitted with dust extraction/ suppression system to control dust emission.

A preliminary drawing is shown below in **Annexure-6**.

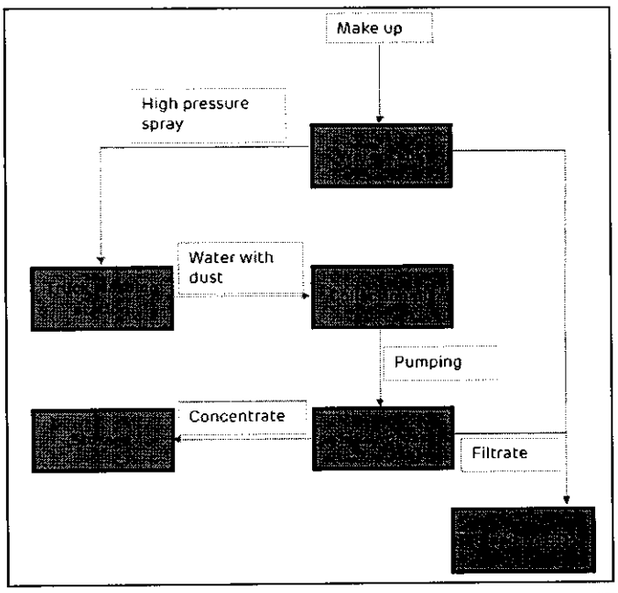
Concentrate Warehouse Dust Collection and Dust Suppression

There are dispersed fly dust points in the concentrate warehouse and are likely to emit dust during unloading through belt conveyor, truck unloading and loading through loader. Thereby, humidification for dust prevention as well as dust collection is the relatively applicable.

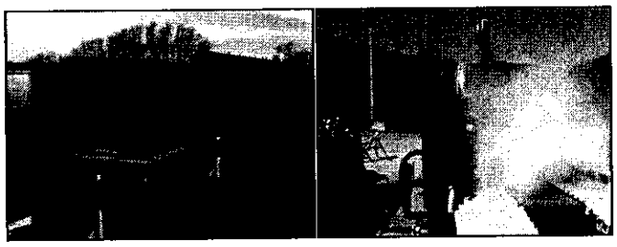
a) Concentrate Unloading in the storage yard:

Sets of fluid spray and dust suppression system will be set in the indoor storage yard for the concentrate warehouse. The principle of fluid spray and dust suppression system is as follows:

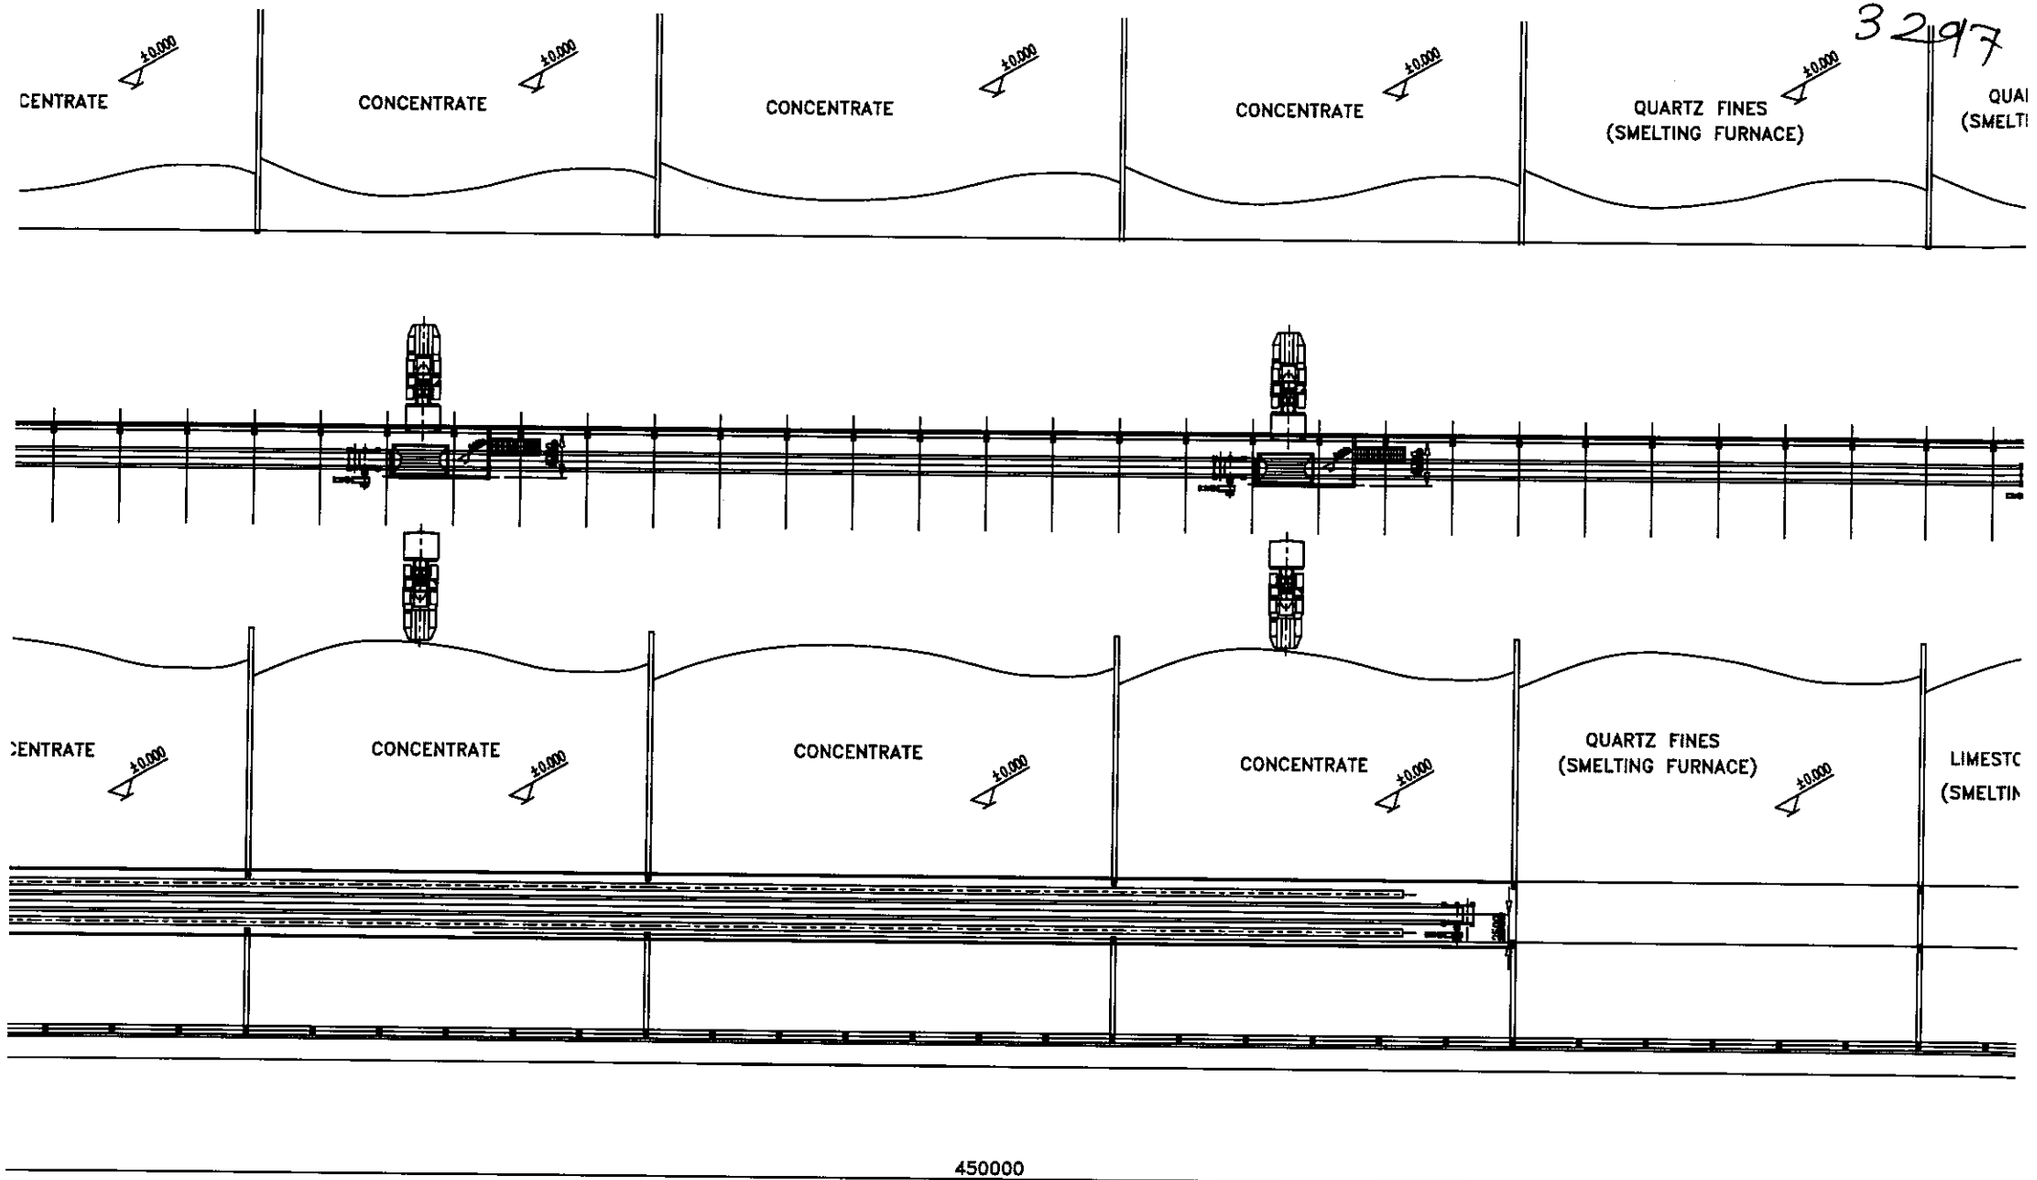
- Moisture, is transmitted to the spray head through the micro-mist device at proper pressure and flow, and then the water mist will be sprayed by the spray head in the form of molecule with the particle size lower than 10 μm, so as to achieve dust suppression.
- The particle size of water mist can be adjusted through regulating the mix ratio of compressed air to water, to achieve the optimal dust-suppression effect.



- Concentrate humidification is carried out, to keep its water content within the reasonable range and prevent fly dust from appearing in the follow-up production section.
- Preliminary capacity of the spray humidification capacity is 60~100 L/min, with the range ≤50 m; the horizontal rotating angle of spray unit is ±90° and the pitch angle is within -10° ~ +30°.



b) Concentrate Loading Hopper:



- Dust collection system connected to bag filter will be installed at every loading point around the loading hopper and in the guide chute of belt conveyor.
- Dust from bag filter will collected in a bin and same will be recycled to concentrate storage yard for consumption.

c) TRUCK WASHING FACILITY

- Trucks which will be transporting the Copper Concentrate from Port warehouse to plant warehouse, will be washed post unloading the copper concentrate to recover the material stuck to the truck body as well as tyres.
- The washed water will be collected in the collection pit and fed to filter press for recovering solids of copper concentrate.
- Recovered copper concentrate will be sent back to concentrate storage area.
- Based on filter water quality bleed will be sent for further treatment to ETP.
- This will help to support environmental protection from land contamination perspective.

EAC OBSERVATION NO.-7

EAC OBSERVATION:

Sulphur balance of the copper smelter unit has not been submitted.

REPLY:

Sulphur is one of the major ingredient in the copper concentrate. Sulphur from the copper concentrate will be largely converted as Sulphur DI- Oxide during smelting process which will be input raw material for Sulphuric Acid plant for production of Sulphuric Acid with 98% concentration. Sulphuric Acid plant is designed to convert 99.92% of SO_2 into concentrated Sulphuric Acid.

A detail sulphur balance has been reworked out considering various input and output material characteristics. Sulphur from various sources such as Copper concentrate, Furnace Oil, Met Coke will largely (~ 97%) converted into concentrated Sulphuric Acid and rest will be available in by product (Copper slag) and waste material such as chemical gypsum and ETP sludge. Residual Off- gas from Sulphuric Acid plant and Flue Gas Desulphurization system will have SO_2 ~ 300 mg/Nm^3.

The following pollution control measures are proposed to reduce SO_2 around ~300 mg/Nm^3 from Sulphuric Acid Plant (SAP) and Flue Gas Desulphurization (FGD):

SAP	FGD
SO_2 emission of ~300 mg/Nm^3 from the residual off-gases coming out of sulphuric acid plant stack will be achieved by: a) Catalytic converter bed configuration of 3+2 with Double Conversion Double Absorption (DCDA) process, for the sulphuric acid plant; with SO_2 conversion efficiency of 99.92%. b) Use of super cesium sulphuric acid catalyst in the final bed of the catalytic converter, which has better conversion efficiency at a temperature lower than 400 ^{0}C. c) Tail gas scrubber to scrub the residual gases coming out of the final absorption tower.	SO_2 emission of ~300 mg/Nm^3 from the residual off-gases coming from Flue Gas Desulphurization system connected to treat smelter secondary off gases, following system will be achieved by: a) Scrubber with amine technology will be installed for treating secondary off gases from smelting furnace, PS converter and slag cleaning furnace. b) Lime scrubber will be installed for treating secondary off gases from electric furnace, anode Furnace and scrap melting furnace.

EAC OBSERVATION NO.-8

3301

EAC OBSERVATION:

Copper slag disposal site co-ordinates, concrete mode of utilization, maximum time frame envisaged for the storage at the disposal yard i.e., one month (or) 15 days has not been submitted.

REPLY:

Copper slag disposal site co-ordinates are marked in Plot Plan in **Annexure-8(a).**

Copper slag from smelting furnace and PS converter will be treated in electric furnace and slag cleaning furnace for recovery of the copper. Copper slag is known as ferro sand in Japan and Korea. In Europe it is also called as Iron Silicate.

Typical analysis is as below:

Sr. No.	Parameter	UOM	Value
1	Cu	%	< 1
2	Fe	%	40 - 50
3	SiO_2	%	26 - 35
4	CaO	%	< 4
5	Al_2O_3	%	1 - 4
6	MgO	%	0.5 - 2
7	S	%	< 0.5

In India Copper slag is used in the following application:

- Abrasive Blasting Grit
- Aggregates for Concrete Mix
- Cement Manufacturing
- Pavement: As an additive to improve sintering and abrasion resistance.
- Road Construction: As an additive in bed structure stabilisation and substitute for stone flour in asphalt.

Utilization of Copper slag is planned in line with Directive from National Highway Authority of India (NHAI) is attached for ready reference in **Annexure-8(b) and 8(c).**

Copper Slag/ Ferro Sand/ Iron Silicate is used in the following applications in European Countries, South East Asia and China:

- Abrasive Blasting Grit
- Aggregates for Concrete Mix
- Cement Manufacturing
- Pavement: As an additive to improve sintering and abrasion resistance.
- Reinforcement : Coastal, Riverside and land slide
- Road Construction: As an additive in bed structure stabilisation and substitute for stone flour in asphalt.
- Bricks: Partial substitute for natural clay – reduces shrinkage and enhances colour.
- Iron Making: Iron bearing material for sinter and pellet production.
- Backfilling: Additive for underground mine and road construction.

Total Area allocated for storage of Copper Slag is around 15 ha. Base of the storage will be prepared to take the load of copper slag to the height of minimum 15 m. This area is sufficient for 6 years, considering NO sales. Greenbelt of 15 m width will be developed all around the storage area and 100 m width along the river side.

For concrete mode of utilization of copper slag MoU's (attached as **Annexure-8(d)**) with following cements and road construction companies were signed:

1) Adani Infra (India) Limited
2) Sanghi Cement Limited
3) EKK Infrastructure Limited
4) Chevrox Construction Private Limited
5) Radheshyam Agrawal

Copper Slag Quality Requirement as per NHAI for Road Making:

Copper slag as Aggregates:

Copper slag is produced as a by-product from copper smelter, while producing copper from copper concentrate (copper pyrite) through pyrometallurgical process. In the process of smelting, the iron present in the copper concentrate combines chemically at 1200°C with silica present in flux materials such as river sand/silica sand/ quartz fines to form iron silicate, which is termed as copper slag. The copper slag thus generated is quenched with water to produce granulated copper slag. Copper slag is a blackish granular material, similar to medium to coarse sand having size ranging from 150 µm to 4.75 mm.

Bureau of Indian Standards as per IS 383:2016 is enclosed as **Annexure-8(e)**, Indian Standard for Coarse and Fine Aggregate is as follow:

SPECIFICATIONS FOR COPPER SLAG AGGREGATE

Sr. No.	Characteristic	Unit of Measurement	Content (max)
1	Calcium oxide as CaO	%	12
2	Total sulphur as S	%	2
3	Total iron as FeO	%	70
4	Chorine as NaCl	%	0.03
5	Cadmium	mg/l	150
6	Lead	mg/l	150
7	Hexavalent chromium	mg/l	250
8	Mercury	mg/l	15
9	Selenium	mg/l	150
10	Fluorine	mg/l	4000
11	Boron	mg/l	4000
12	Sieve analysis	mm	0.15 - 4.75

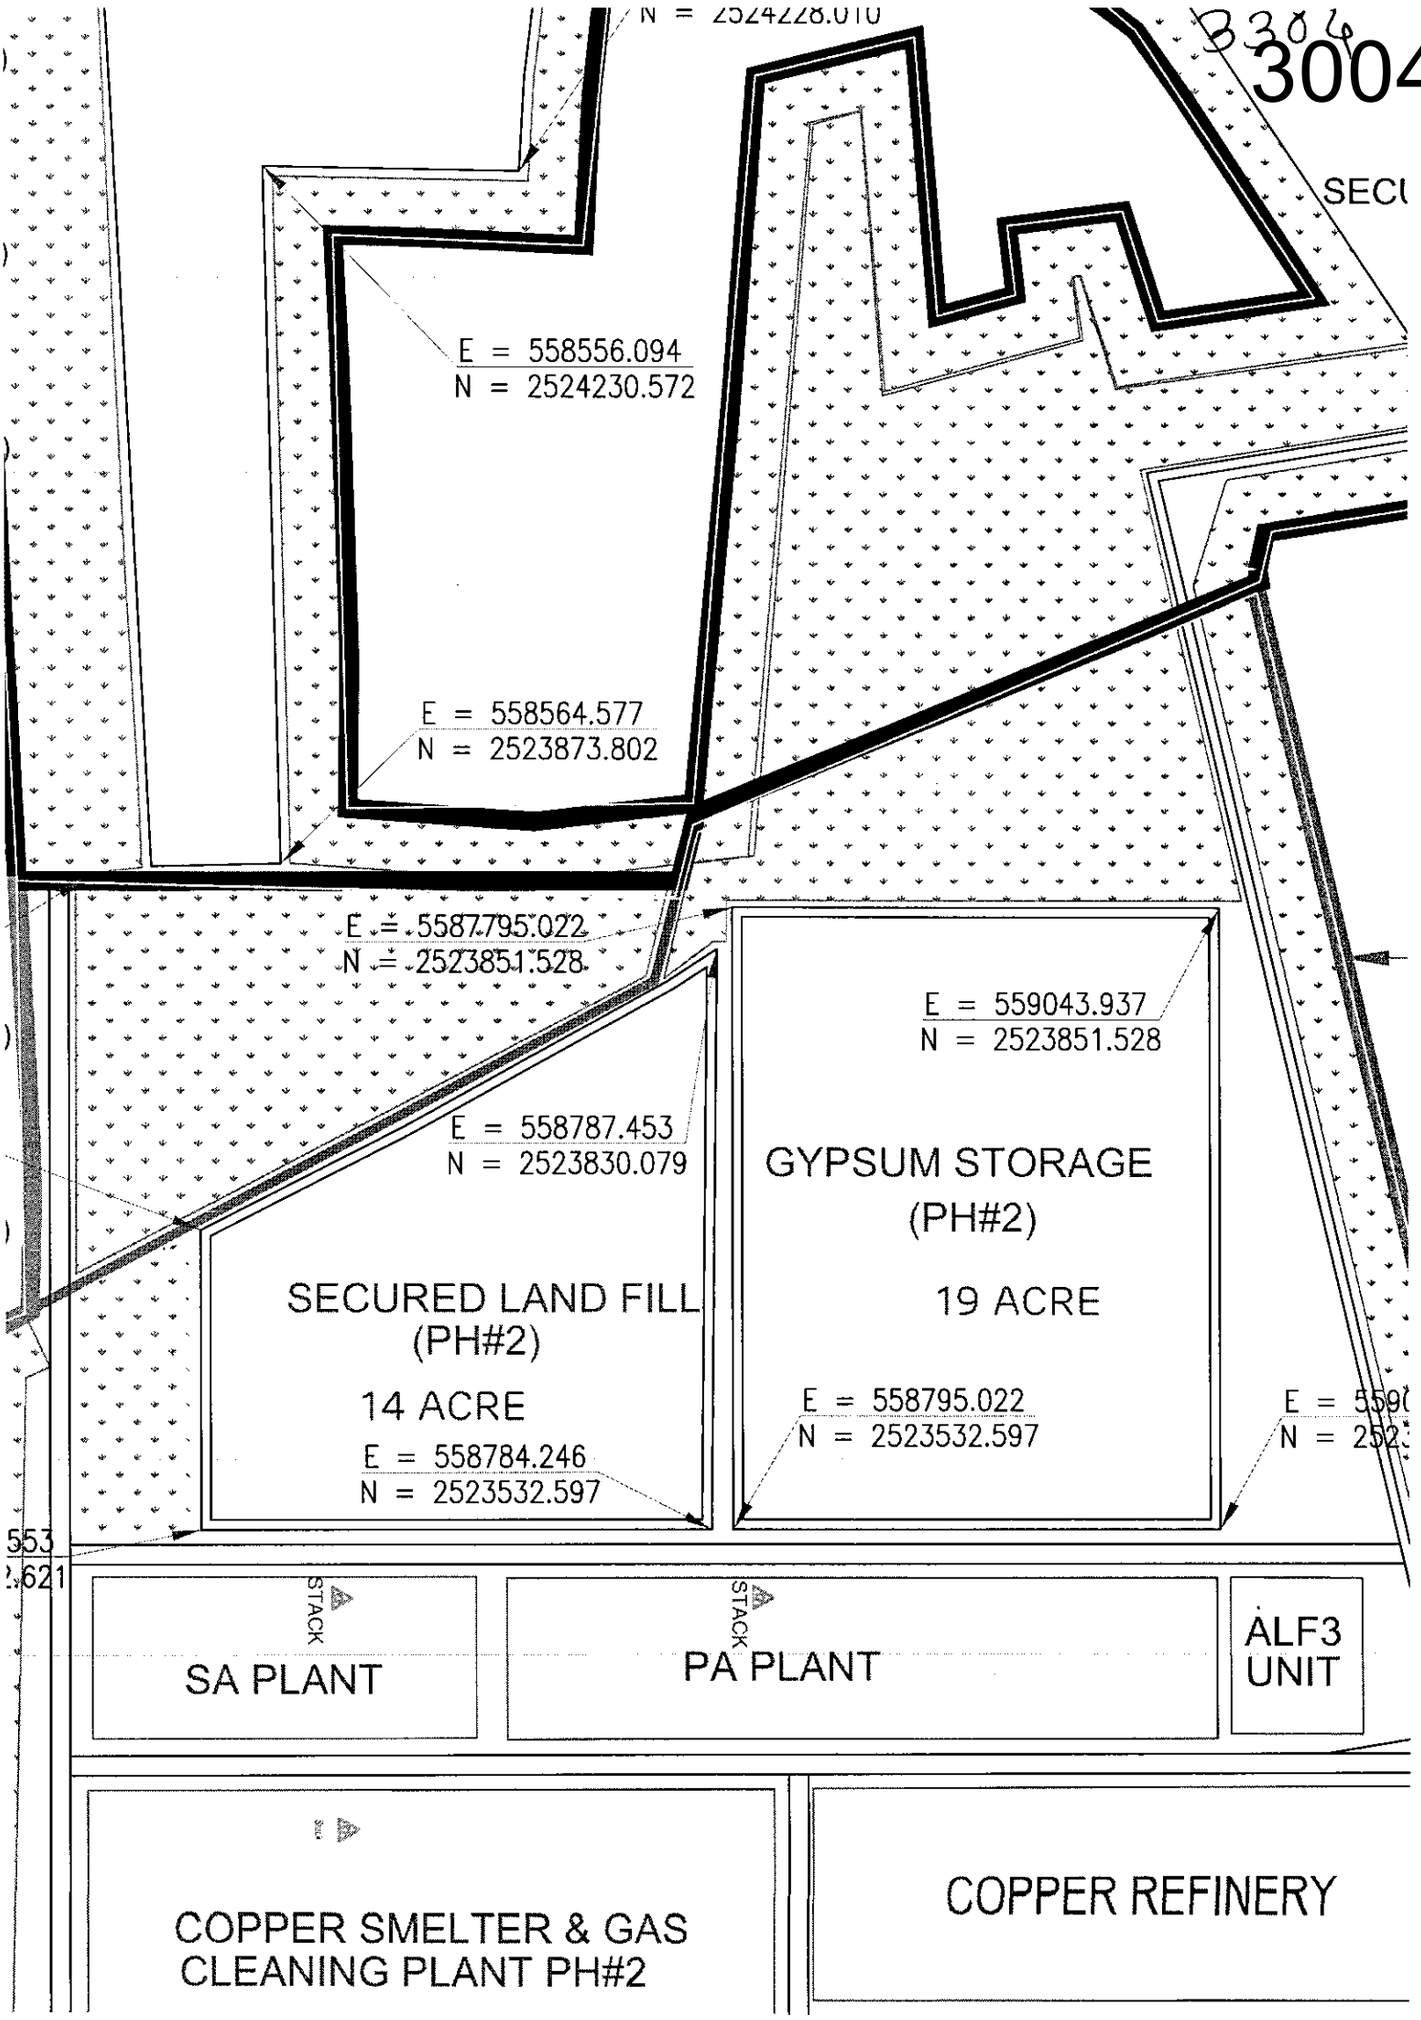
Environmental Safety & Quality Standards using Iron, Steel & Copper Slag Aggregates:

The technique commonly in use are Inductively Coupled Plasma (ICP) spectroscopy and Atomic Absorption Spectrophotometer (AAS) for checking hazardous substances.

3303

EAC OBSERVATION NO.-8

COPPER SLAG MAXIMUM UTILIZATION AS PER NHAI FOR ROAD MAKING



Sr. No.	Type of Aggregate	Maximum Utilization		
		Plain Concrete (%)	Reinforced Concrete (%)	Lean Concrete (<M15, %)
1	**Coarse aggregate**			
a	Iron slag aggregate	50	25	100
b	Steel slag aggregate	25	Nil	100
c	Recycled concrete aggregate (RCA)	25	20 (Only upto M25 grade)	100
d	Recycled aggregate	Nil	Nil	100
e	Bottom ash Thermal Power Plants	Nil	Nil	25
2	**Fine aggregate**			
a	Iron slag aggregate	50	25	100
b	Steel slag aggregate	25	Nil	100
c	Copper slag aggregate	40	35	50
d	Recycled concrete aggregate (RCA)	25	20 (Only upto M25 grade)	100

The increase in density of concrete due to use of copper slag and steel slag aggregates need to be taken into consideration in the design of structures. Copper slag having higher specific gravity (up to 3.8) shall be permitted for part replacement of aggregates and the average specific gravity of the fine aggregate is not more than 3.2.

Abstract from NHAI letter dated 19th July 2016 directing list of new material/ technologies with use and benefits on National Highways.

Name of the New Material / Technology	General use and Benefits	Suitability
Copper slag	**Copper slag is non-hazardous and best suited for:** 1) Land reclamation 2) Cement & concrete application **Benefits:** 1) Huge saving on natural resources 2) Non-toxic and non-leachable in nature	It can be used as sub-base layer after mixing with pond ash. It can also be used in different bituminous mixes.

No. NHAI/TIC/R&D/2016-85846

19th July'16

To,
ALL Regional Officers
National Highways Authority of India.

Sub : Use of alternative material such as Steel Slag in road construction.

Sir,

The Hon'ble Minister of RT&H has shown his keen interest in use of alternative waste material in road construction such a Steel Slag etc.

2. In this regard, it is to inform that MoRT&H vide OM No. RW/NH-35075/1/2010-S&R (R) dated 6th August'14 **(copy enclosed)** has accredited the use of Processed steel slag Aggregate on trial basis as a replacement for natural aggregates in Bitumen roads. This will provide better bonding with bitumen, high abrasion resistance, improved skid resistance, cost effective alternative to natural aggregates and safe non-hazardous recycled material.

3. Further, Bureau of Indian Standards as per IS 383 :2016, Indian Standard for Coarse and Fine Aggregate for Concrete—Specification (Third Revision) vide para 4.2.2 (Table 4.2.1) has provision of following :

Sr. No.	Type of Aggregate	Maximum Utilization		
		Plain concrete	Reinforced concrete percent	Lean concrete (less than M15 Grade percent
(1)	(2)	(3)	(4)	(5)
i) Coarse aggregate	a) Iron slag aggregate	50	25	100
	b) Steel Slag aggregate	25	Nil	100
	c) Recycled concrete aggregate (RCA) (see note 1)	25	20 (only upto M25 grade)	100
	d) Recycled aggregate (RA)	Nil	Nil	100
	e) Bottom ash from Thermal Power Plants	Nil	nil	25
ii) Fine Aggregate	a) Iron Slag Aggregate	50	25	100
	b) Steel slag aggregate	25	Nil	100
	c) Copper slag aggregate	40	35	50
	d) Recycled concrete aggregate (RCA) (see note 1)	25	20 (only upto M25 Grade)	100

8609
19/7/16

MoRT(SN) Dt 4 2017 To all PD's for n.a.

Amitav PJ M.A. A.p.u.

3306

See A-3 for brief information on recycled aggregates (RA) and recycled concrete aggregates (RCA)

Notes :

1. It is desirable to sources the recycled concrete aggregates from site being redeveloped for use in the same site.
2. In any given structure, only one type of manufactures coarse aggregate and one type of manufactured fine aggregate shall be used.
3. The increase in density of concrete due to use of copper slag and steel slag aggregates need to be taken into consideration in the design of structures.
4. While using manufactured aggregate as part replacement for natural aggregate, it should be ensured that the final grading meets the requirements specified in table 7 table 8 and table 9.

4. The same has also been accredited by Indian Road Congress (IRC) as per IRC letter no. IRC-24 (12)/2014 (ACC-129) dated 26th June 2014.

5. In view of the above, you are suggested to use steel slag in upcoming / on-going projects as per requirement and intimate the performance on the use of steel slag to the undersigned. Further, a quarterly statement to the extent of use of steel slag be provided to this office for record & perusal.

6. This may please be noted that NHAI should not bear any contractual implications on this account. The regulation of use of above material shall be kept in line with the existing provision of contract/ concessionaire Agreements. Deviation, if any should be got approved from competent Authority accordingly.

7. This issues with the approval of Competent Authority.

Yours faithfully,

Sabharwal 19/7/16

(Ajay Kumar Sabharwal)
General Manager (TIC)

GOVERNMENT OF INDIA
MINISTRY OF ROAD TRANSPORT & HIGHWAYS

Parivahan Bhavan,
1, Sansad Marg
New Delhi-110001

No. RW/NH-35075/1/2010- S&R (R) Dated: 6th August, 2014

OFFICE MEMORANDUM

Subject: Use of emerging new materials and techniques in construction of National Highways.

In continuation of SR&T (Roads) Zone's OM of even number dated 08.10.2013, the minutes of the meeting of Coordination Committee dated 22nd May, 2014 in respect of newly accredited materials/ techniques such as Instant road repair cold mix compound – INSSTAPATTCH, Anti stripping additive (Zycosoil) & water proofing compounds – Terrasil, Terraprime and IPPL SS –IX - Soil Stabilizer, containing merits and demerits were circulated to all project zones vide SR&T (Roads) Zone letter of even number dated 30th May, 2014 with the request to incorporate and utilize considering their suitability in different States on trial basis. The list of new accredited materials/ techniques, as on date, is as below:

(i) Geocells,
(ii) Warm Mix Asphalt Technology,
(iii) Water Proofing Membranes,
(iv) Non-woven, Woven Geotextiles & Techglass,
(v) Jarofix,
(vi) Thiopave – Asphalt Modifier,
(vii) Infrared Recycling Pothole Repair System,
(viii) Water proofing for Bridge decks and pavements,
(ix) Copper Slag,
(x) Processed Steel Slag Aggregates,
(xi) RoadstaB Technology,
(xii) Evercrete Deep Penetrating Sealer,
(xiii) RBI Grade-81,
(xiv) Tenax 3D Grids and
(xv) Roadcem
(xvi) Instant road repair cold mix compound - INSSTAPATTCH
(xvii) Anti stripping additive (Zycosoil) and water proofing compounds – Terrasil, Terraprime
(xviii) IPPL SS –IX - Soil Stabilizer

2. It is requested that the status of utilization of the new materials/ techniques along with performance feedback, if any, may be provided to SR&T (Roads) Zone for necessary action. The specific use and suitability of the new materials/ techniques is enclosed at Annex-I.

Gulshan 6/8/14
[Gulshan]
Assistant Executive Engineer (R) (S, R&T)

3309

Annex-I

List of new materials/ technologies with their use and benefits on National Highways

S. No.	Name of the New material / Technology	General use and Benefits	Suitability
1.	Geocells	StrataWeb® is a 3D cellular confinement system which confines the infill material and improves the load bearing capacity of the base.	Over weak soils – expansive soils, clays and soils with low CBR values
2.	Warm Mix Asphalt Technology	Allows mix production at about 30°C lower temperatures that conventional hot mix, thus imparting performance benefits, constructability advantages and environmental benefits as well.	For bituminous woks.
3.	Water Proofing Membrane	Super Thermolay APP PMT Membranes are ideal for a wide range of water proofing applications including roofs, reservoirs, basements, basement roof, sunken slabs, tunnels, terrace garden and car parking. Advantages: (i) Total impermeability (ii) Excellent resistance to ageing and weathering. (iii) Outstanding bond-ability and seam integrity. (iv) Stability at high temperatures	To prevent the intrusion of corrosive substance into the concrete, which will result in deterioration of the structures, leading to spalling of concrete
4 (i).	Woven geo-textiles	Filtration / Separation and Soil Stabilization	It can be used between granular sub-base / base course and the sub-grade.
4 (ii).	Non-Woven geo-textiles	Filtration / Separation, Paving fabrics / Slope protection	It can be used in side drainage for its functions.
4 (iii).	Techglass	Rehabilitation & Preservation of Pavements	Used to reduce the development of reflection cracks.
5.	Jarofix	It is at par with conventional material and also the material is on OMC.	In embankment and sub-grade construction.
6.	Shell Thiopave	In cold and seasonal climates where thermal cracking is an issue, Shell Thiopave allows the use of softer bitumen with improved low temperature properties without sacrificing high temperature properties. In hot climates, where conventional bitumen often do not deliver the high level of stiffness required, Shell Thiopave improves anti-rutting performance while still allowing the effective use of locally available bitumen.	For bituminous woks
7.	Nu-phalt Infrared Recycling Pothole Repair System	(i) It rejuvenates the existing asphalt, thereby, saving on material and making the process eco-friendly. (iii) This system allows the surface to be heated to about 150 to 160 °C without damaging, destroying or burning the existing asphalt.	Suitable for potholes, failed joints, cracked and undulated road surface.

8.	Polyguard NW-75 for Bridge Decks or pavement waterproofing	It can be applied to highways, bridge decks, parking garages etc. prior to overlay, Polyguard under seal provides an impermeable layer protecting seal rebar from moisture and corrosion.	For highways, bridge decks, parking garages
9.	Copper slag	Copper slag is non hazardous and best suited for (i) Land reclamation. (ii) Cement & concrete application. Benefits: (i) Huge saving on natural resources. (ii) Non-toxic and non leachable in nature.	It can be used as sub-base layer after mixing with pond ash. It can also be used in different bituminous mixes.
10.	Processed Steel Slag Aggregate	1. Intended use: As a replacement for natural aggregates in Bitumen roads. 2. Benefits: (i) Better bonding with Bitumen (ii) High abrasion resistance (iii) Improved skid resistance (iv) Cost effective alternative to natural aggregate (v) Safe / Non-hazardous recycled material.	In bituminous roads
11	RoadstaB Technology	RoadstaB Technology can be used in bases and sub-bases of the road crust.	For soil stabilization.
12.	Evercrete Deep penetrating Sealer	Evercrete Deep Penetrating Sealer (DPS), is water based, ready to use, concrete sealer that strengthens, preserves and enhances life of concrete structures.	It prevents concrete from chlorides ion ingress, corrosion and hence enhances the life of concrete structures.
13.	RBI Grade 81 – Soil Stabilizer	It reduces requirement construction materials like aggregates; borrow pit soil etc. thus reducing the transportation cost it also reduces Life Cycle Cost.	It can be used in various pavement layers i.e. for sub-grade, sub-base and base layers.
14.	Tenax 3D Grids	To increase the interlocking and bearing capacity of the unbound layers within Indian Highway Road Construction Layers (Sub-grade, GSB, WMM and DBM). Benefits: (1) Reduce the thickness of WMM and DBM thereby reducing the overall cost of the road pavement (2) Improve bearing capacity of soil.	It can be used in Sub-grade, GSB, WMM and DBM layers.
15.	RoadCem	It is used in combination with cement and sometimes fly-ash to form a base for a road with the soil available on site. Benefits: (1) No damage from water (2) High quality road with a low maintenance cycle (3) Faster construction (4) Stabilization of Black Cotton Soil (5) Environmental feasibility	
16.	Instant road repair cold mix compound - INSSTAPATTCH	INSSTAPATTCH can be used for Instant repairs of Potholes and Patches on city roads and Highways. Potholes repaired by INSSTAPATTCH are time saving, cost saving, does not cause any traffic hindrance and is environmental friendly.	For road repairs

3311

17.	Zycosoil Nano Technology Terrasil Terraprime	Reactive anti-strip additive in hot mix binder and Soil & aggregate waterproofing Sub-grade multilayer waterproofing to eliminate capillary rise Penetrative waterproofed prime coat	Reactive anti-strip additive for asphalt layers Waterproofing of in-situ soil Waterproofing of soil/ stone base of WMM/ WBM
18	IPPL SS – IX (SoilTech MK-III) Soil Stabilizer	The product is used for stabilizing the base and sub-base layers of roads, Mine Haul Roads, Parking lots, hard stands and Container Depots. Benefit: The product intends to substantially reduce the quantity of aggregates from quarries / borrow pits. Due to the flexible nature of the Polymers, the pavement surface allows a certain amount of flexibility on the road and does not become brittle which dramatically reduces the maintenance of the stabilized roads.	The IPPL SS – IX Polymer stabilizer is water based which can be used extensively for stabilizing the base and sub-base layers of road. The product gains excellent strength from mechanical compaction and is an excellent solution for heavily trafficked roads and hard stands.

POLICY MATTERS – TECHNICAL (41/2010)
(Decision taken on TIC Division's File No. NHAI/Tech/TIC/Genl/2009)

Sub: Encouraging the use of Slag Aggregate in Granular Sub-Base (GSB).

The Steel Plants in the country generate large amount of slag which remains unutilized. Reference have been received from various steel plants such as Bokaro Steel Plant to use slag aggregates in road projects as an environmental friendly measure. Specification for Road and Bridge works issued by Ministry of Road Transport and Highways also allow the use of crushed slag for Granular Sub-Base (GSB).

2. It has been therefore, decided to use steel furnace/blast furnace/copper slag aggregates in Granular Sub-Base provided that the same satisfies the physical requirements/gradings etc. as stipulated in the specifications. The Contractors/Concessionaires shall use slag aggregates in GSB especially in the projects lying in the regions of these types of slag production.

3. This issues with the approval of Chairman, NHAI.

MEMORANDUM OF UNDERSTANDING (MOU) FOR UTILISATION OF COPPER SLAG

THIS MOU is entered on this 09 day of April Month 2019 Year between **Adani Enterprises Limited**, a company registered under the Companies Act, 1956, and having its registered office at Adani House, Near Mithakhali Six Roads, Navrangpura, Ahmedabad 380009, Gujarat, India (hereinafter referred to as **"AEL"**, which expression shall, unless excluded by or repugnant to the context or meaning thereof, be deemed to include its successors and assigns) being the party of the **FIRST PART**.

AND

Adani Infra (India) Limited, a Company registered under the Company's Act 1956 and having its registered office at Adani House, Near Mithakhali Six Roads, Navrangpura, Ahmedabad 380009, Gujarat, India (hereinafter referred to as **"AIIL"** which expression shall, unless excluded by or repugnant to the context or meaning thereof, be deemed to include its successors and assigns) being the party of the **SECOND PART**.

Both AEL and AIIL may hereinafter also be referred to jointly as the **'Parties'** and severally as a **'Party'**

WHEREAS

AEL is setting up 1 Million Copper Smelter Complex at Mundra, Gujarat (hereinafter referred to as **"CP"**) and shall be generating in process, 2 Million Ton per annum quantity of copper Slag (hereinafter referred to as **"Slag"**) which can be utilized in road construction activity and ready mix concrete (RMC), paver blocks manufacturing etc.

The Parties hereto have decided to enter into an MOU on the following terms and conditions:

NOW, THEREFORE, IN CONSIDERATION OF THE ABOVE PREMISES AND OF THE UNDERTAKINGS HEREIN FURNISHED, IT IS HEREBY AGREED BY AND BETWEEN THE PARTIES AS FOLLOWS:

1.0 AEL will make available Slag that will be generated from its copper smelter as per the requirement of AIIL from the commercial date of operation. The quantities, delivery schedule and the other commercial terms & conditions will be mutually decided by both the parties at a date closer to the commercial date of operation

2.0 AEL & AIIL shall discuss the further steps to be taken in order to carry out the purpose of this MoU. Both the parties will endeavour to finalize and enter into such requisite Agreements, as may be necessary in line with the related rules, regulation and notifications of State/Central Government Department/Agencies.

EFFECTIVE DATE, COMMENCEMENT DATE & VALIDITY OF THE MOU

1.0 The effective date shall be the date of this MOU.

BothAEL and RSA may hereinafter also be referred to jointly as the **'Parties'** and severally as a **'Party'**

WHEREAS

AEL is setting up 1 Million Copper Smelter Complex at Mundra, Gujarat (hereinafter referred to as "CP") and shall be generating in process, 2 Million Ton per annum quantity of copper Slag (hereinafter referred to as **"Slag"**) which can be utilizedinroad construction activity and ready mix concrete (RMC), paver blocks manufacturing etc.

The Partieshereto have decided to enter into an MOU on the following terms and conditions:

NOW, THEREFORE, IN CONSIDERATION OF THE ABOVE PREMISES AND OF THE UNDERTAKINGS HEREIN FURNISHED, IT IS HEREBY AGREED BY AND BETWEEN THE PARTIES AS FOLLOWS:

1.0 AEL will make available Slag that will be generated from its copper smelter as per the requirement of RSAfrom the commercial date of operation. The quantities, delivery schedule and the other commercial terms & conditions will be mutually decided by both the parties at a date closer to the commercial date of operation

2.0 AEL &RSA shall discuss the further steps to be taken in order to carry out the purpose of this MoU. Both the parties will endeavour to finalize and enter into such requisite Agreements, as may be necessary in line with the related rules, regulation and notifications of State/Central Government Department/Agencies.

EFFECTIVE DATE, COMMENCEMENT DATE & VALIDITY OF THE MOU

1.0 The effective date shall be the date of this MOU.

2.0 This MOU shall remain valid till the time a definitive detailed agreement incorporating all the commercials, scope, penalty and legal related matters is executed between the parties.

Cement and Concrete Sectional Committee, CED 02

FOREWORD

This Indian Standard (Third Revision) was adopted by the Bureau of Indian Standards, after the draft finalized by the Cement and Concrete Sectional Committee had been approved by the Civil Engineering Division Council.

Aggregates are important components for making concrete and properties of concrete are substantially affected by various characteristics of the aggregates used. Aggregates from natural sources form the major variety used for making concrete, mortar and other applications. This Indian Standard has been formulated to cover requirements for aggregates derived from natural sources and other than natural sources, for use in production of concrete.

Whilst the requirements specified in this standard generally meet the normal requirements for most of the concrete works, there might be special cases where certain requirements other than those specified in the standard might have to be specified; in such case, such special requirements, the tests required and the limits for such tests may be specified by the purchaser.

This standard was first published in 1952 and subsequently revised in 1963 and 1970. This revision has been taken up to incorporate the modifications found necessary in the light of experience gained in its use and also to bring it in line with the latest development on the subject. Significant modifications in this revision include,

a) scope of the standard has been widened to cover aggregates from other than natural sources;
b) definitions of various terms have been rationalized;
c) limits for mica as deleterious material for muscovite and muscovite plus biotite varieties have been included;
d) the requirements for crushing value, impact value and abrasion value have been classified under a common head of mechanical properties;
e) requirement for flakiness and elongation has been specified for which a combined index has been introduced along with the procedure for determination of the same;
f) provisions on alkali aggregate reactivity have been included to bring coherence of the same with IS 456 : 2000 'Code of practice for plain and reinforced concrete (*fourth revision*)' and requirements for compliance for the same have been included; and
g) mixed sand has been included along with crushed sand.

Of late, scarcity in availability of aggregates from natural sources is being faced in some parts of the country. This may require supplementing the use of aggregates from natural sources with the use of aggregates from other sources. This revision therefore also covers provisions regarding quality requirements and those relating to the extent of utilization of iron slag, steel slag, copper slag, bottom ash from thermal power plants recycled concrete aggregates (RCA) and recycled aggregate (RA), along with necessary provisions relating to their utilization. RCA and RA may in turn be sourced from construction and demolition wastes. A brief note on manufacture of various types of such manufactured aggregates is given at Annex A. A crusher dust (or quarry dust) produced from the fine screening of quarry crushing cannot be called crushed sand as per **3.1.2**. It may not be generally in conformity to the requirement of crushed sand as per the standard and is not expected to perform as efficiently as properly crushed sand, unless it is processed to meet the requirement of this standard.

This standard contains clauses such as **8.1, 8.2, 8.3, 8.4, 9.1** and **9.2** which call for agreement between the purchaser and the supplier and require the supplier to furnish technical information as given in Annex B.

The composition of the Committee responsible for the formulation of this standard is given in Annex F.

For the purpose of deciding whether a particular requirement of this standard is compiled with, the final value, observed or calculated, expressing the result of a test or analysis shall be rounded off in accordance with IS 2 : 1960 'Rules for rounding off numerical values (*revised*)'. The number of significant places retained in the rounded off value should be the same as that specified value in this standard.

Indian Standard

COARSE AND FINE AGGREGATE FOR CONCRETE — SPECIFICATION

(Third Revision)

1 SCOPE

This standard covers the requirements for aggregates, crushed or uncrushed, derived from natural sources, such as river terraces and riverbeds, glacial deposits, rocks, boulders and gravels, and manufactured aggregates produced from other than natural sources, for use in the production of concrete for normal structural purposes including mass concrete works.

2 REFERENCES

The standards listed below contain provisions which, through reference in this text, constitute provisions of this standard. At the time of publication, the editions indicated were valid. All standards are subject to revision, and parties to agreements based on this standard are encouraged to investigate the possibility of applying the most recent editions of the standards indicated below:

IS No.	*Title*

3 TERMINOLOGY

For the purpose of this standard, the definitions given in IS 6461 (Part 1) and the following shall apply.

3.1 Fine Aggregate — Aggregate most of which passes 4.75 mm IS Sieve and contains only so much coarser material as permitted in **6.3**.

3.1.1 *Natural Sand* — Fine aggregate resulting from the natural disintegration of rock and which has been deposited by streams or glacial agencies. This may also be called as uncrushed sand.

3.1.2 *Crushed Sand*

3.1.2.1 *Crushed stone sand* — Fine aggregate produced by crushing hard stone.

3.1.2.2 *Crushed gravel sand* — Fine aggregate produced by crushing natural gravel.

3.1.3 *Mixed Sand* — Fine aggregate produced by blending natural sand and crushed stone sand or crushed gravel sand in suitable proportions.

3.1.4 *Manufactured Fine Aggregate (Manufactured Sand)* — Fine aggregate manufactured from other than natural sources, by processing materials, using thermal or other processes such as separation, washing, crushing and scrubbing.

NOTE — Manufactured fine aggregate may be Recycled Concrete Aggregate (RCA) (*see* Annex A).

3.2 Coarse Aggregate — Aggregate most of which is retained on 4.75 mm IS Sieve and containing only so much finer material as is permitted for the various types described in this standard.

NOTE — Coarse aggregate may be,

a) uncrushed gravel or stone which results from natural disintegration of rock;

b) crushed gravel or stone when it results from crushing of gravel or hard stone; and

c) partially crushed gravel or stone when it is a product of the blending of (a) and (b);

d) manufactured from other than natural sources, by processing materials, using thermal or other processes such as separation, washing, crushing and scrubbing. Manufactured coarse aggregate may be Recycled Concrete Aggregate (RCA) or Recycled Aggregate (RA) (*see* Annex A).

3.3 All-in-Aggregate — Material composed of fine aggregate and coarse aggregate.

4 CLASSIFICATION

The aggregate shall be classified as given in **4.1** and **4.2**. In case of mixed sand (*see* **3.1.3**), the manufacturer/ supplier should supply the individual sands to be mixed at site, at the time of batching.

4.1 Aggregates from Natural Sources

These shall be coarse and fine aggregates as defined in **3.1.1, 3.1.2, 3.1.3** and **3.2** [*see also* Note under **3.2**(a), (b) and (c)]

4.2 Manufactured Aggregates and Extent of Utilization

4.2.1 These shall be coarse and fine aggregates as defined in **3.1.4** and **3.2** [*see also* Note under **3.2**(d)].

The manufactured aggregates shall be permitted with their extent of utilization as percent of total mass of fine or coarse aggregate as the case may be, as indicated in Table 1 against each, for use in plain and reinforced concrete and lean concrete.

4.2.2 Manufactured aggregates shall not be permitted for use in prestressed concrete.

5 QUALITY OF AGGREGATE

5.1 General

Aggregate shall be naturally occurring (crushed or uncrushed) stones, gravel and sand or combination thereof or produced from other than natural sources. They shall be hard, strong, dense, durable, clear and free from veins; and free from injurious amounts of disintegrated pieces, alkali, free lime, vegetable matter and other deleterious substances as well as adherent coating. As far as possible, scoriaceous, flaky and elongated pieces should be avoided.

5.2 Deleterious Materials

Aggregate shall not contain any harmful material, such as pyrites, coal, lignite, mica, shale or similar laminated material, clay, alkali, free lime, soft fragments, sea shells and organic impurities in such quantity as to affect the strength or durability of concrete. Aggregate to be used for reinforced concrete shall not contain any material liable to attack the steel reinforcement.

5.2.1 *Limits of Deleterious Materials*

The maximum quantity of deleterious materials shall not exceed the limits specified in Table 2. However, the engineer-in-charge at his discretion, may relax some of the limits as a result of some further tests and evidence of satisfactory performance of the aggregates.

Table 1 Extent of Utilization
(*Clause* 4.2.1)

Sl No.	Type of Aggregate	Maximum Utilization		
		Plain Concrete Percent	Reinforced Concrete Percent	Lean Concrete (Less than M15 Grade) Percent
(1)	(2)	(3)	(4)	(5)
i) Coarse aggregate:				
a)	Iron slag aggregate	50	25	100
b)	Steel slag aggregate	25	Nil	100
c)	Recycled concrete aggregate[1)] (RCA) (*See* Note 1)	25	20 (Only upto M25 Grade)	100
d)	Recycled aggregate[1)] (RA)	Nil	Nil	100
e)	Bottom ash from Thermal Power Plants	Nil	Nil	25
ii) Fine aggregate:				
a)	Iron slag aggregate	50	25	100
b)	Steel slag aggregate	25	Nil	100
c)	Copper slag aggregate	40	35	50
d)	Recycled concrete aggregate[1)] (RCA) (*See* Note 1)	25	20 (Only upto M25 Grade)	100

[1)] *See* **A-3** for brief information on recycled aggregates (RA) and recycled concrete aggregates (RCA).

NOTES

1 It is desirable to source the recycled concrete aggregates from sites being redeveloped for use in the same site.

2 In any given structure, only one type of manufactured coarse aggregate and one type of manufactured fine aggregate shall be used.

3 The increase in density of concrete due to use of copper slag and steel slag aggregates need to be taken into consideration in the design of structures.

4 While using manufactured aggregate as part replacement for natural aggregate, it should be ensured that the final grading meets the requirements specified in Table 7, Table 8 and Table 9.

Table 2 Limits of Deleterious Materials

(*Clause* 5.2.1)

Sl No.	Deleterious Substance	Method of Test, Ref to	Fine Aggregate Percentage by Mass, *Max*			Coarse Aggregate Percentage by Mass, *Max*		
			Uncrushed	Crushed/ Mixed	Manufactured	Uncrushed	Crushed	Manufactured
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)
i)	Coal and lignite	IS 2386 (Part 2)	1.00	1.00	1.00	1.00	1.00	1.00
ii)	Clay lumps	IS 2386 (Part 2)	1.00	1.00	1.00	1.00	1.00	1.00
iii)	Materials finer than 75 µm IS Sieve	IS 2386 (Part 1)	3.00	15.00 (for crushed sand) 12.00 (for mixed sand) *see* Note 1)	10.00	1.00	1.00	1.00
iv)	Soft fragments	IS 2386 (Part 2)	—	—	—	3.00	—	3.00
v)	Shale	(*see* Note 2)	1.00	—	1.00	—	—	—
vi)	Total of percentages of all deleterious materials (except mica) including Sl No. (i) to (v) for col 4, 7 and 8 and Sl No. (i) and (ii) for col 5, 6 and 9	—	5.00	2.00	2.00	5.00	2.00	2.00

NOTES

1 The sands used for blending in mixed sand shall individually also satisfy the requirements of Table 2. The uncrushed sand used for blending shall not have material finer than 75 µm more than 3.00 percent.

2 When the clay stones are harder, platy and fissile, they are known as shales. The presence and extent of shales shall be determined by petrograpy at the time of selection and change of source.

3 The presence of mica in the fine aggregate has been found to affect adversely the workability, strength, abrasion resistance and durability of concrete. Where no tests for strength and durability are conducted, the mica in the fine aggregate may be limited to 1.00 percent by mass. Where tests are conducted to ensure adequate workability, satisfactory strength, permeability and abrasion (for wearing surfaces), the mica up to 3.00 percent by mass for muscovite type shall be permitted. In case of presence of both muscovite and biotite mica, the permissible limit shall be 5.00 percent, maximum by mass. This is subject to total deleterious materials (including mica) being limited to 8.00 percent by mass for col 4 and 5.00 percent for col 5.

Till a method is included in IS 2386 (Part 2), for determination of mica content, suitable methodology may be used for the same. Normally, petrographic density separation and wind blowing methods can be used.

4 The aggregate shall not contain harmful organic impurities [tested in accordance with IS 2386 (Part 2)] in sufficient quantities to affect adversely the strength or durability of concrete. A fine aggregate which fails in the testing of organic impurities may be used, provided that, when tested for the effect of organic impurities on the strength of mortar, the relative strength at 7 and 28 days, reported in accordance with IS 2386 (Part 6) is not less than 95 percent.

5.3 Combined Flakiness and Elongation Index

Flakiness and elongation shall be determined in accordance with IS 2386 (Part 1) on the same sample. After carrying out the flakiness index test, the flaky material shall be removed from the sample and the remaining portion shall be used for carrying out elongation index. Indices so worked out shall be added numerically to give combined flakiness and elongation index. The combined flakiness and elongation index so obtained shall not exceed 40 percent for uncrushed or crushed aggregate. However, the engineer-in-charge at his discretion may relax the limit keeping in view the requirement, and availability of aggregates and performance based on tests on concrete.

5.4 Mechanical Properties

5.4.1 *Aggregate Crushing Value/Ten Percent Fines Value*

The aggregate crushing value/ten percent fines value, when determined in accordance with IS 2386 (Part 4) shall be as follows:

a) For aggregates to be used in concrete for wearing surfaces, (such as runways, roads, pavements, tunnel lining carrying water, spillways and stilling basins) : 30 percent, *Max*

b) For aggregates to be used in concrete other than for wearing surfaces	:	In case the aggregate crushing value exceeds 30 percent, then the test for 'ten percent fines' should be conducted and the minimum load for the ten percent fines should be 50 kN

5.4.2 *Aggregates Impact Value*

As an alternative to **5.4.1**, the aggregate impact value may be determined in accordance with the method specified in IS 2386 (Part 4). The aggregate impact value shall not exceed the following values:

a) For aggregates to be used in concrete for wearing surfaces, (such as runways, roads, pavements, tunnel lining carrying water, spillways and stilling basins)	:	30 percent
b) For aggregates to be used in concrete other than for wearing surfaces	:	45 percent

NOTE — For concrete of grades M 65 and above, stronger aggregates are required and hence the maximum aggregate crushing value and aggregate impact value shall not exceed 22 percent.

5.4.3 *Aggregate Abrasion Value*

The aggregate abrasion value, when determined in accordance with IS 2386 (Part 4) using Los Angeles machine, shall not exceed the following values:

a) For aggregates to be used in concrete for wearing surfaces, (such as runways, roads, pavements, spillways, tunnel lining carrying water and stilling basins)	:	30 percent
b) For aggregates to be used in concrete other than for wearing surfaces	:	50 percent

5.5 Soundness of Aggregate

5.5.1 For concrete liable to be exposed to the action of frost, the coarse and fine aggregates shall pass a sodium or magnesium sulphate accelerated soundness test specified in IS 2386 (Part 5), the limits being set by agreement between the purchaser and the supplier.

NOTE — As a general guide, it may be taken that the average loss of mass after 5 cycles shall not exceed the following:

a) For fine aggregate	:	10 percent when tested with sodium sulphate (Na_2SO_4), and 15 percent when testing with magnesium sulphate ($MgSO_4$)
b) For coarse aggregate	:	12 percent when tested with sodium sulphate (Na_2SO_4), and 18 percent when tested with magnesium sulphate ($MgSO_4$)

5.5.2 For slag aggregates, following additional tests shall be carried out:

a) *Iron unsoundness* — When chemical analysis of aggregates shows that the ferrous oxide content is equal to or more than 3.0 percent, and sulphur content is equal to or more than 1.0 percent, the aggregate shall be tested for iron unsoundness. The iron unsoundness of the slag aggregate when tested as per the procedure given in Annex D, shall not exceed 1 percent.

b) *Volumetric expansion ratio* — It shall not be more than 2.0 percent. The procedure shall be as given in Annex E.

c) *Unsoundness due to free lime* — Prior to use of iron slag (for production of aggregates) from a new source or when significant changes in furnace chemistry occur in an existing source which may result in the presence of free lime, the potential for pop-out formation shall be assessed by determining the free-lime content of the slag by petrographic examination or quantitative x-ray diffractometry on a representative sample.

If the number of particles containing free lime exceeds 1 in 20, then weathering of the slag stockpile (in moist condition or at/near saturated surface dry condition) represented by the test sample shall be continued until further testing shows that the level has fallen below 1 in 20.

5.6 Alkali Aggregate Reaction

Some aggregates containing particular varieties of silica may be susceptible to attack by alkalies (Na_2O and K_2O) originating from cement and other sources, producing an expansive reaction which can cause cracking and disruption of concrete. Damage to concrete from this reaction will normally only occur when all the following are present together:

a) A high moisture level within the concrete.

b) A cement with high alkali content, or another source of alkali.

c) Aggregate containing an alkali reactive constituent.

NOTE — The aggregates containing more than 20 percent strained quartz and undulatory extinction angle greater than 15°, causing deleterious reaction and also possibly showing presence of microcrystalline quartz is known as slowly reactive aggregates.

The aggregate shall comply with the requirements as follows, when tested in accordance with IS 2386 (Part 7):

1) *Chemical method*— The aggregate when tested in accordance with the chemical method, shall conform to the requirement as specified in IS 2386 (Part 7). If test results indicate deleterious or potentially deleterious character, the aggregate should be tested using mortar bar method as specified in IS 2386 (Part 7) to verify the potential for expansion in concrete. This chemical method (for determination of potential reactivity) however, is not found to be suitable for slowly reactive aggregates or for aggregate containing carbonates (limestone aggregates) or magnesium silicates, such as antigorite (serpentine). Therefore, petrographic analysis of aggregates shall be carried out to find out the strained quartz percentage, undulatory extinction angle and its mineral composition before conducting the test.

2) *Mortar bar method*

   i) *Using 38°C temperature regime* — The permissible limits for mortar bar expansion at 38°C shall be 0.05 percent at 90 days and 0.10 percent at 180 days. For slowly reactive aggregates (as explained in NOTE above) mortar bar method using temperature regime of 38°C shall not be used for determination of potential reactivity. Such slowly reactive aggregates shall be tested using 60°C temperature regime. Therefore, petrographic analysis of aggregates shall be carried out to find out the strained quartz percentage, undulatory extinction angle and its mineral composition before conducting the test.

   ii) *Using 60°C temperature regime* — The permissible limit mortar bar expansion at 60°C shall be 0.05 percent at 90 days and 0.06 percent at 180 days for slowly reactive aggregates.

3) *Accelerated mortar bar method* — The accelerated mortar bar test shall be carried out at 80°C using 1N NaOH. The test is found to be specially suitable for slowly reactive aggregate. The criteria for this test is as under:

   i) Expansions of less than 0.10 percent at 16 days after casting are indicative of innocuous behavior in most cases (*see* Note).

      NOTE — Some granitic gneisses and metabasalts have been found to be deleteriously expansive in field performance even though their expansion in this test was less than 0.10 percent at 16 days after casting. With such aggregate, it is recommended that prior field performance be investigated. In the absence of field performance data, mitigative measures should be taken.

   ii) Expansions of more than 0.20 percent at 16 days after casting are indicative of potentially deleterious expansion [*see* **4.2.2** of IS 2386 (Part 7)].

   iii) Expansions between 0.10 and 0.20 percent at 16 days after casting include both aggregate that are known to be innocuous and deleterious in field performance. For these aggregate, it is particularly important to develop supplemental information as described in **4.2.2** of IS 2386 (Part 7). In such a situation, it may also be useful to take comparator reading until 28 days. It may be useful to support this test with test by mortar bar method at 38°C and 60°C, as applicable.

In few locations in the country, dolomitic and limestone aggregates are encountered. In such cases, concrete prism test shall be preferred over mortar bar test. The test should cover the determination by measurement of length change of concrete prisms, the susceptibility of cement-aggregate combinations to expansive alkali-carbonate reaction involving hydroxide ions associated with alkalis (sodium and potassium) and certain calcitic dolomites and dolomitic limestones. Till this test is included in IS 2386 (Part 7), specialist literature may be referred for the test and applicable requirement.

5.7 Manufactured aggregates shall meet the additional requirements as given in Table 3, Table 4, Table 5 and Table 6.

Table 3 Additional Requirements for all Manufactured Aggregates
(*Clause* 5.7)

Sl No. (1)	Characteristic (2)	Requirement (3)
i)	Total alkali content as Na_2O equivalent, percent, *Max*	0.3
ii)	Total sulphate content as SO_3, percent, *Max*	0.5
iii)	Acid soluble chloride content, percent, *Max*	0.04
iv)	Water absorption, percent, *Max*	5 (*see* Note 1)
v)	Specific gravity	2.1 to 3.2 (*see* Notes 2 and 3)

NOTES

1 For recycled concrete aggregate and recycled aggregate, higher water absorption up to 10 percent may be permitted subject to pre-wetting (saturation) of aggregates before batching and mixing.

2 The limits are intended for use of aggregate in normal weight concrete.

3 Copper slag having higher specific gravity (up to 3.8) shall be permitted for part replacement of aggregates in accordance with **4.2.1**, such that the average specific gravity of the fine aggregate is not more than 3.2.

Table 4 Additional Requirements for Iron and Steel Slag Aggregates
(*Clause* 5.7)

Sl No. (1)	Characteristic (2)	Requirement (3)
i)	Calcium oxide as CaO, percent, *Max*	45.0
ii)	Total sulphur as S, percent, *Max*	2.0
iii)	Total iron as FeO, percent, *Max*	3.0

NOTE — Stockpiling of slag aggregate: Crushed slag aggregate should be stockpiled in moist condition at or near the saturated surface dry (SSD) condition before use, with the moisture condition being maintained by sprinkling with water.

iv)	Chlorine as NaCl, percent, *Max*	0.03

6 SIZE AND GRADING OF AGGREGATES

6.1 Single-Sized Coarse Aggregates

Coarse aggregates shall be supplied in the nominal sizes given in Table 7. For any one of the nominal sizes, the proportion of other sizes, as determined by the method described in IS 2386 (Part 1) shall also be in accordance with Table 7.

6.1.1 *Coarse Aggregate for Mass Concrete*

Coarse aggregate for mass concrete works shall be in the sizes specified in Table 8.

6.2 Graded Coarse Aggregates

Graded coarse aggregates may be supplied in the nominal sizes given in Table 7.

6.3 Fine Aggregate

The grading of fine aggregate, when determined as described in IS 2386 (Part 1) shall be within the limits given in Table 9 and shall be described as fine aggregate, Grading Zones I, II, III and IV. Where the grading falls outside the limits of any particular grading zone of sieves other than 600 µm IS Sieve by an amount not exceeding 5 percent for a particular sieve size, (subject to a cumulative amount of 10 percent), it shall be regarded as falling within that grading zone. This tolerance shall not be applied to percentage passing the 600 µm IS Sieve or to percentage passing any other sieve size on the coarse limit of Grading Zone I or the finer limit of Grading Zone IV.

6.4 All-in-Aggregate

If combined aggregates are available they need not be separated into fine and coarse. The grading of the all-in-aggregate, when analyzed, as described in IS 2386 (Part 1) shall be in accordance with Table 10. Necessary adjustments may be made in the grading by the addition of single-sized aggregates

7 SAMPLING AND TESTING

7.1 Sampling

The method of sampling shall be in accordance with

Table 7 Coarse Aggregates

vi)	300 µm	5-20	8-30	12-40	15-50
vii)	150 µm	0-10	0-10	0-10	0-15

NOTES

1 For crushed stone sands, the permissible limit on 150 µm IS Sieve is increased to 20 percent. This does not affect the 5 percent allowance permitted in **6.3** applying to other sieve sizes.

2 Fine aggregate complying with the requirements of any grading zone in this table is suitable for concrete but the quality of concrete produced will depend upon a number of factors including proportions.

3 As the fine aggregate grading becomes progressively finer, that is, from Grading Zones I to IV, the ratio of fine aggregate to coarse aggregate should be progressively reduced. The most suitable fine to coarse ratio to be used for any particular mix will, however, depend upon the actual grading, particle shape and surface texture of both fine and coarse aggregates.

4 It is recommended that fine aggregate conforming to Grading Zone IV should not be used in reinforced concrete unless tests have been made to ascertain the suitability of proposed mix proportions.

IS 2430. The amount of material required for each test shall be as specified in the relevant method of test given in IS 2386 (Part 1) to IS 2386 (Part 8).

7.2 Chemical tests like alkalies (Na_2O equivalent), sulphate (SO_3), calcium oxide, sulphur (S), iron (FeO), magnesium oxide (MgO), silica (SiO_2) and chlorine (NaCl), can be carried out as per IS 4032 and water soluble chloride test can be carried out as per IS 14959 (Part 2). All other tests shall be carried out as described in IS 2386 (Part 1) to IS 2386 (Part 8) and in this standard.

7.2.1 In the case of all-in-aggregate, for the purpose of tests to verify its compliance with the requirements given in Table 2, and when necessary for such other tests as required by the purchaser, the aggregate shall be first separated into two fractions, one finer than 4.75 mm IS Sieve and the other coarser than 4.75 mm IS Sieve, and the appropriate tests shall be made on samples from each component, the former being tested as fine aggregate and the latter as coarse aggregate.

Table 10 All-in-Aggregate Grading

iv)	4.75 mm	25 to 45	30 to 50
v)	600 µm	8 to 30	10 to 35
vi)	150 µm	0 to 6	0 to 6

8 SUPPLIER'S CERTIFICATE AND COST OF TESTS

8.1 The supplier shall satisfy himself that the material complies with the requirements of this standard and, if requested, shall supply a certificate to this effect to the purchaser.

8.2 If the purchaser requires independent tests to be made, the sample for such tests shall be taken before or immediately after delivery according to the option of the purchaser, and the tests carried out in accordance with this standard and on the written instructions of the purchaser.

8.3 The supplier shall supply free of charge, the material required for tests.

8.4 The cost of the tests carried out under **8.2** shall be borne by,

a) the supplier, if the results show that the material does not comply with this standard; and

b) the purchaser, if the results show that the material complies with this standard.

9 DELIVERY

9.1 Supplies of aggregate may be made in bulk in suitable quantities mutually agreed upon between the purchaser and the supplier. Where so required by the purchaser, the aggregate may be supplied in bags (jute, jute-laminated, polyethylene lined or as may be mutually agreed between the purchaser and the supplier) bearing the net quantity (may be 25 kg, 50 kg, 300 kg,

600 kg or as agreed to between the purchaser and the supplier). The tolerance on the quantity of aggregate in each bag or consignment shall be as per **9.2** unless mutually agreed upon between the purchaser and the supplier.

9.2 Tolerance Requirements for the Quantity of Aggregate Packed in Bags

9.2.1 The average of net quantity of aggregate packed in bags at the plant in a sample shall be equal to or more than 25 kg, 50 kg, 300 kg, 600 kg, etc, as applicable. The number of bags in a sample shall be as given below:

Batch Size	*Sample Size*
100 to 150	20
151 to 280	32
281 to 500	50
501 to 1 200	80
1 201 to 3 200	125
3 201 and over	200

The bags in a sample shall be selected at random (*see* IS 4905).

9.2.2 The number of bags in a sample showing a minus error greater than 2 percent of the specified net quantity shall be not more than 5 percent of the bags in the sample. Also the minus error in none of such bags in the sample shall exceed 4 percent of the specified net quantity of aggregate in the bag.

9.2.3 In case of a wagon or truck load of 5 to 25 t, the overall tolerance on net quantity of aggregate shall be 0 to + 0.5 percent.

10 MARKING

10.1 Each consignment/bag of aggregate shall be legibly and indelibly marked with the following information:

a) Manufacturer's name and his registered trade-mark, if any;
b) Net quantity, in kg;
c) Words 'Use no Hooks' on the bags;
d) Batch/control unit number;
e) Address of the manufacturer;
f) Month and year of consignment/packing;
g) Type of aggregate, such as 'Coarse Aggregate' or 'Fine Aggregate';
h) In case the aggregates are from natural sources, the words 'Natural Aggregate';
j) In case of aggregates from other than natural sources, the type of coarse/fine aggregate (*see* Table 1);
k) In case of coarse aggregate, the nominal size along with the words, 'Single Sized' or 'Graded', as the case may be; and
m) In case of fine aggregate, the grading zone.

10.2 Similar information shall be provided in the delivery advices accompanying the shipment of aggregate in bulk (*see* **10.3**).

10.3 BIS Certification Marking

The aggregate may also be marked with the Standard Mark.

10.3.1 The use of the Standard Mark is governed by the provisions of the *Bureau of Indian Standards Act*, 1986 and the Rules and Regulations made thereunder. The details of conditions under which a license for the use of the Standard Mark may be granted to manufacturers or producers may be obtained from the Bureau of Indian Standards.

ANNEX A

(*Foreword*)

BRIEF INFORMATION ON AGGREGATES FROM OTHER THAN NATURAL SOURCES

A-1 IRON AND STEEL SLAG AGGREGATES

A-1.1 Iron Slag Aggregate

A-1.1.1 Iron slag is obtained as a byproduct, while producing iron in blast furnaces or basic oxygen furnaces in integrated iron and steel plants. The lime in the flux chemically combines with the aluminates and silicates of the iron ore and coke ash to form a non-metallic product called iron/blast furnace slag. The molten slag at a temperature of approximately 1 500°C is taken out of the furnace and cooled to form different types of slag products.

A-1.1.2 *Air Cooled Iron Slag Aggregate*

Molten slag is allowed to flow from the furnace into open pits located beside the furnaces where the material is quenched with water to facilitate cooling and crystallization. The slag after cooling can be further crushed and screened to produce different sizes of aggregates. During its usage, care should be taken to ensure that the slag passes the test for 'iron unsoundness' and is pre-wetted prior to its use. Figure 1 shows typical air-cooled iron slag aggregate.

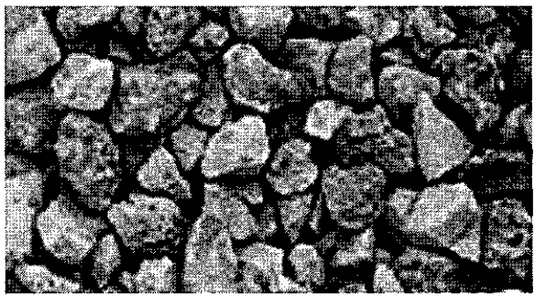

FIG. 1 AIR COOLED IRON SLAG AGGREGATE

A-1.1.3 *Granulated Iron Slag Aggregate*

In this case, molten slag is allowed to flow through the launders into a granulation plant, where molten slag is quenched rapidly with large volume of water. This results in vitrified (glassy) material with a sand-like appearance, with particles typically 1 mm to 5 mm size. It is a light weight aggregate, which needs further processing to improve the bulk density to more than 1.35 kg/l for its use as normal weight aggregate. Figure 2 shows typical granulated iron slag aggregate.

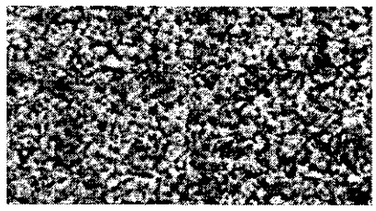

FIG. 2 GRANULATED IRON SLAG AGGREGATE

A-1.2 Steel Slag Aggregate

Steel slag is a byproduct produced in steel making operations in integrated iron and steel plants. The calcined lime used as flux combines with the silicates, aluminum oxides, magnesium oxides, manganese oxides and ferrites to form steel furnace slag, commonly called steel slag. Slag is poured in a cooling yard from the furnace at a temperature of 1 400 °C - 1 700 °C and cooled by air and sprinkling of water. Steelmaking slag contains about 10 to 20 metallic iron percent by mass, and is recovered by magnetic separation. The metal free slag is crushed and screened to different sizes for use as aggregates. For use as aggregates, the steel slag is subjected to weathering process (natural or accelerated) to reduce the free lime content in the slag. Figure 3 shows typical steel slag aggregate.

NOTE — Air Cooled Blast furnace Slag (ACBFS) has unique chemical and physical properties that influence its behaviour as an aggregate in concrete. Several of the key chemical properties are provided but the physical property of greatest concern is the high level of porosity compared to that present in naturally derived aggregates, which contributes to high absorption capacities. This is important during construction, as the moisture condition of the aggregate will impact workability and early-age, shrinkage-related cracking, if the aggregate is not kept sufficiently moist prior to batching. It may also have long-term ramifications on in service durability, depending on the level of saturation those aggregates are subjected to either at the bottom of the slabs or in the vicinity of joints and cracks.

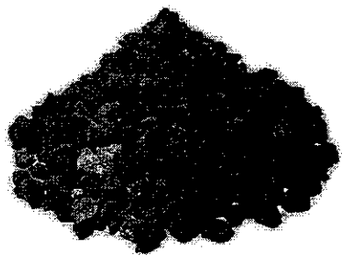

FIG. 3 STEEL SLAG AGGREGATE

A-2 COPPER SLAG AS AGGREGATES

Copper slag is produced as a byproduct from copper smelter, while producing copper from copper concentrate (copper pyrite) through pyrometallurgical process. In the process of smelting, the iron present in the copper concentrate combines chemically at 1 200°C with silica present in flux materials such as river sand/silica sand/ quartz fines to form iron silicate, which is termed as copper slag. The copper slag thus generated is quenched with water to produce granulated copper slag.

Copper slag is a blackish granular material, similar to medium to coarse sand having size ranging from 150 µm to 4.75 mm. This aggregate has potential for use as fine aggregate in accordance with provisions of this standard (*see* Fig. 4).

FIG. 4 TYPICAL COPPER SLAG AGGREGATE

A-3 CONSTRUCTION AND DEMOLITION (C&D) WASTE

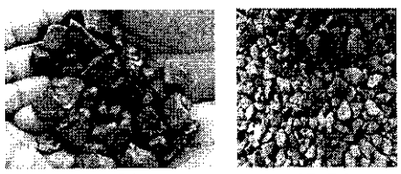
Use of construction and demolition (C&D) waste for manufacture of aggregates is a step towards effective management and utilization of this waste. This however, requires necessary care while producing aggregates to ensure their efficacy in their use as part of concrete. These aggregates may be of two types namely Recycled Aggregate (RA) and Recycled Concrete Aggregate (RCA). RA is made from C&D waste which may comprise concrete, brick, tiles, stone, etc, and RCA is derived from concrete after requisite processing.

Recycled concrete aggregate (RCA) contain not only the original aggregate, but also hydrated cement paste adhering to its surface. This paste reduces the specific gravity and increases the porosity compared to similar virgin aggregates. Higher porosity of RCA leads to a higher absorption. Recycled aggregate (RA) will typically have higher absorption and lower specific gravity than natural aggregate. The concrete rubble has to be properly processed, including scrubbing to remove the adhered hydrated cement as much as possible.

The broad steps involved in the manufacture of aggregates from C&D waste may be:

a) Receipt and inspection of C&D waste at the plant.
b) Weighing of waste.
c) Mechanical and manual segregation and resizing - this may involve segregation of various types of wastes such as bricks, stones, concrete, steel, tiles, etc.
d) Dry and wet processing.

Figure 5, Figure 6A and Figure 6B show typical C&D waste, recycled concrete aggregate and recycled aggregate obtained there from.



RA can be used as coarse aggregate and RCA can be used as coarse and fine aggregates in accordance with this standard.

A-4 ENVIRONMENTAL SAFETY AND QUALITY STANDARDS USING IRON AND STEEL AND COPPER SLAG AGGREGATES

The engineer-in-charge may get the iron and steel and copper slag aggregates checked for hazardous substances, at appropriate frequency. Specialist literature may be referred for the test method, the technique commonly in use are Inductively Coupled Plasma (ICP) spectroscopy and Atomic Absorption Spectrophotometer (AAS). As a guide the values given in Table 11 may be followed as the permissible values.

FIG. 5. DEMOLITION WASTE BEFORE PROCESSING

ANNEX B

(*Foreword*)

INFORMATION TO BE FURNISHED BY THE SUPPLIER

B-1 DETAILS OF INFORMATION

When requested by the purchaser or his representative, the supplier shall provide the following particulars:

a) Source of supply, that is, precise location of source from where the materials were obtained;

b) Trade group of principal rock type present, in case of aggregates from natural sources (*see* Annex C);

c) Physical characteristics, in case of aggregates from natural sources (*see* Annex C);

d) In case of manufactured aggregates, the brief manufacturing process, source of parent material and special characteristics having bearing on concrete properties, such as presence of adhered coating in case of recycled concrete aggregate, to the extent possible.

e) Presence of reactive minerals;

f) Service history, if any and in particular, in case of manufactured aggregates, the name of projects where used and the performance including in recently completed projects; and

g) In case of manufactured aggregates, special precautions, if any, to be observed during concrete production.

ANNEX C

(*Clause* B-1.1)

DESCRIPTION AND PHYSICAL CHARACTERISTICS OF AGGREGATES FROM NATURAL SOURCES, FOR CONCRETE

C-1 GENERAL HEADINGS

To enable detailed reports on aggregate, the petrographic examination as per IS 2386 (Part 8) may be carried out and information in the following general headings may be given, are suggested as a guide:

a) *Trade group* — For example, granite, limestone and sandstone (*see* **C-2.2**);

b) *Petrological name and description* — The correct petrological name should be used and should be accompanied by a brief description of such properties as hardness, colour, grain, imperfections, etc;

c) *Description of the bulk* — The degree of cleanliness, that is, freedom from dust, should be stated and reference made to the presence of any pieces not representative of the bulk;

d) *Particle shapes* — *See* **C-3**; and

e) *Surface texture* — *See* **C-3**.

C-2 NOMENCLATURE OF ROCK

C-2.1 The technical nomenclature of rocks is an extensive one and for practical purposes it is sufficient to group together with those rocks having certain petrological characteristics in common. Accordingly, the list of trade groups given in **C-2.2** is adopted for the convenience of producers and users of aggregates.

C-2.2 Trade Groups of Rocks Used as Concrete Aggregate

The list of rocks placed under appropriate trade groups is given below:

a) IGNEOUS ROCKS

1) *Granite Group*

Granite	Granodiorite
Gmnophyre	Diorite
	Syenite

2) *Gabbro Group*

Gabbro	Peridotite
Norite	Pyroxenite
Anorthosite	Epidiorite

3) *Aplite Group*

Aplite	Quartz reef
Porphyry	

4) *Dolerite Group*

Dolerite	Lamprophyre

5) *Rhyolite Group*

Rhyolite	Felsite
Trachyte	Pumicite

6) *Basalt Group*

Andesite	Basalt

b) SEDIMENTARY ROCKS

1) *Sandstone Group*

Sandstone	Arkose
Quartzite	Graywacke
	Grit

2) *Limestone Group*

Limestone	Dolomite

c) METAMORPHIC ROCKS

1) *Granulite and Gneiss Groups*

Granite gneiss	Amphibolite
Composite gneiss	Granulite

2) *Schist Group*

Slate	Phyllite
	Schist

3) *Marble Group*

Marble	Crystalline limestone

The correct identification of a rock and its placing under the appropriate trade group shall be left to the decision of the Geological Survey of India or any competent geologist.

C-3 PARTICLE SHAPE AND SURFACE TEXTURE

C-3.1 The external characteristics of any mixture of mineral aggregate include a wide variety of physical shape, colour and surface condition. In order to avoid lengthy descriptions, it may be convenient to apply to distinctive group types of aggregates some general term which could be adopted.

C-3.2 The simple system shown in Table 12 and Table 13 has, therefore, been devised for facilitate defining the essential features of both particle shape and surface characteristics.

Table 12 Particle Shape
(*Clause* C-3.2)

Sl No.	Classification	Description	Illustrations of Characteristic Specimens	Example
(1)	(2)	(3)	(4)	(5)
i)	Rounded	Fully water worn or completely shaped by attrition	Fig. 7	River or seashore gravels; desert, seashore and windblown sands
ii)	Irregular or partly rounded	Naturally irregular, or partly shaped by attrition, and having rounded edges	Fig. 8	Pit sands and gravels; land or dug flints; cuboid rock
iii)	Angular	Possessing well-defined edges formed at the inter-section of roughly planar faces	Fig. 9	Crushed rocks of all types; talus; screes
iv)	Flaky	Material, usually angular, of which the thickness is small relative to the width and/or length	Fig. 10	Laminated rocks

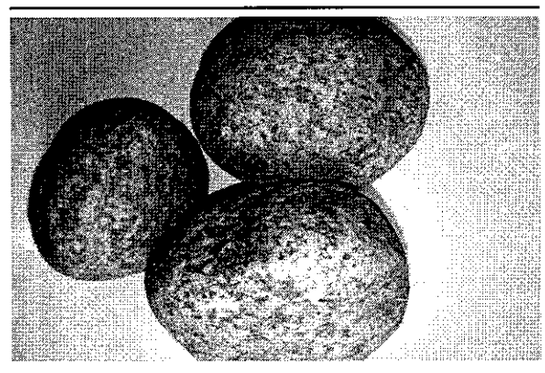

FIG. 7 PARTICLE SHAPE - ROUNDED

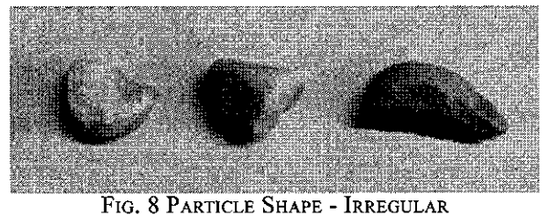

FIG. 8 PARTICLE SHAPE - IRREGULAR

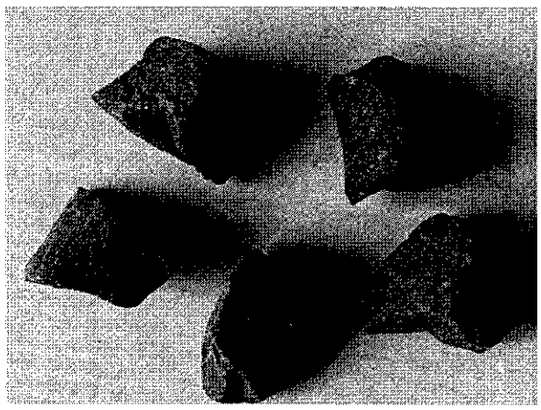

FIG. 9 PARTICLE SHAPE - ANGULAR

FIG. 10 PARTICLE SHAPE - FLAKY

C-3.3 Surface characteristics have been classified under five groups in Table 13. The grouping is broad; it does not purport to be a precise petrographical classification but is based upon a visual examination of hand specimens. With certain materials, however, it may be necessary to use a combined description with more than one group number for an adequate description of the surface texture, for example, crushed gravel 1 and 2; oolites 3 and 5.

Table 13 Surface Characteristics of Aggregates
(*Clause* C-3.2)

Sl No.	Group	Surface Texture	Example
(1)	(2)	(3)	(4)
i)	1	Glassy	Black flint
ii)	2	Smooth	Chert, slate, marble, some rhyolite
iii)	3	Granular	Sandstone, oolites
iv)	4	Crystalline	a) *Fine* — Basalt, trachyte, keratophyre b) *Medium* — Dolerite, granophyre, granulite, microgranite, some limestones, many dolomites c) *Coarse* — Gabbro, gneiss, granite, granodiorite, syenite
v)	5	Honey - combed and porous	Scoriae, pumice, trass

ANNEX D

[*Clause* 5.5.2 (a)]

DETERMINATION OF IRON UNSOUNDNESS FOR SLAG AGGREGATES

D-1 Some slags containing more than 3 percent ferrous oxide (FeO) will disintegrate on immersion in water when the sulphur (S) content of the slag is 1 percent or more. Aggregates derived from such slags show iron unsoundness.

D-2 PROCEDURE

Take randomly two test samples of not less than 50 pieces each of aggregate passing 40 mm and retained on 20 mm IS sieve. Immerse the pieces of first sample in distilled or deionized water at room temperature for a period of 14 days. Remove the pieces from the water at the end of the 14 day period and examine them.

D-3 CRITERIA FOR CONFORMITY

If no piece develops the following unsoundness during the storage period, the slag aggregate shall be deemed to be free from iron unsoundness:

a) Cracking (development of a visible crack),

b) Disintegration (physical breakdown of aggregate particle),

c) Shaling (development of fretting or cleavage of the aggregate particle), or

d) Craze cracking at the surface of the aggregate.

The second test sample shall be tested, if any of the pieces (in the above sample) shows cracking, disintegration, shaling or craze cracking at the surface of the aggregate. If not more than one in one hundred pieces (1 percent) of the two test samples tested shows cracking, disintegration, shaling or craze cracking at the surface of the aggregate, the slag shall be regarded as free from iron unsoundness.

ANNEX E

[*Clause* 5.5.2 (b)]

DETERMINATION OF VOLUMETRIC EXPANSION RATIO OF SLAG AGGREGATES

E-1 This test specifies the procedure to calculate the volumetric expansion ratio for the evaluation of the potential expansion of aggregates like steel slag due to hydration reactions. This method can also be used to evaluate the effectiveness of weathering processes for reducing the expansive potential of such aggregate materials.

E-2 APPARATUS AND TOOLS

a) *Moulds with base plate, stay rod and wing nut, perforated plate* — These shall conform to **4.1**, **4.3** and **4.4** of IS 9669.

b) *Metal Rammer* — As specified in **5.1** of IS 9198.

c) *Curing apparatus* — The curing apparatus shall be a thermostat water tank, capable of holding not less than two 15 cm moulds, and able to keep the water temperature at 80 ± 3°C for 6 h.

d) *Sieves* — These shall be 31.5 mm, 26.5 mm, 13.2 mm, 4.75 mm, 2.36 mm, 500 µm and 75 µm IS sieves.

e) *Expansion measuring apparatus* — The expansion measuring apparatus shall be as shown in Fig. 11.

E-3 SAMPLE

E-3.1 Preparation of Sample

The samples of slag shall be collected so as to represent the whole lot. The samples shall be prepared to meet the grading requirement given in Table 14.

Table 14 Grading Distribution
(*Clause* E-3.1)

Sl No. (1)	Sieve Size (2)	Percentage Passing (3)
i)	31.5 mm	100
ii)	26.5 mm	97.5
iii)	13.2 mm	70
iv)	4.75 mm	47.3
v)	2.36 mm	35
vi)	500 µm	20
vii)	75 µm	6

E-3.2 Adjustment of Sample

The adjustment of sample shall be as follows:

a) Add water to approximately 30 kg of sample so that the difference between the moisture content and the optimum moisture content is within 1 percent. Mix it well to make moisture content uniform, and keep it for not less than 24 h.

b) Reduce the above sample and obtain the sample necessary for making three specimens.

E-4 TEST PROCEDURE

E-4.1 Specimen Preparation

The specimens shall be prepared as follows:

a) Attach collar and perforated base plate to the mould, put spacer disc in it, and spread a filter paper on it.

b) The measurement of moisture content shall be conducted on two samples, each sample weighing not less than 500 g. When the measured value of moisture content differs from the value of optimum moisture ratio by not less than 1 percent, new specimens shall be prepared for curing.

c) Pour the samples prepared as in **E-3.2**, in the mould with a scoop keeping a falling height of approximately 50 mm and ram the sample into three layers one upon another so that the depth of each layer after ramming is nearly equal to one another.

d) Ram the layer uniformly by free dropping of the rammer 92 times from a height of 450 mm above each rammed surface. The ramming shall be performed on a rigid and flat foundation such as a concrete floor.

e) Rammed surfaces shall be scratched slightly with a sharp ended steel bar for securing adhesion between layers.

f) After finishing the ramming, remove the collar, shave out the excess sample stuck on upper part of the mould with a straight knife carefully. At this time, holes on the surface due to the removing of coarse grade materials shall be filled with fine grade materials, and the top surface shall be reformed

g) Turn the mould upside down gently pushing the reformed top surface with a lid so that the specimen in the mould does not decay or drop down, then remove the perforated base plate and take out the spacer-disc.

h) Spread a filter paper on the perforated base

plate, turn the mould upside down gently again, connect to the perforated base plate again for securing adhesion to the filter paper.

j) Wipe off the materials of the specimen stuck on the outside of the mould and the perforated base plate, and measure the total mass.

k) From the sum of masses of the rammed specimen, the mould and the perforated base plate, subtract the masses of the mould and the perforated base plate, and divide it by the volume of the mould, which gives the wet density of the rammed specimen.

E-4.2 Curing and Measuring Operation of the Specimen

The curing and measuring operation of the specimen shall be as follows:

a) Place the perforated plate with shaft on the filter paper which is spread on the top surface of the specimen in the mould.

b) Install the dial-gauge and the attaching device (gauge holder) correctly. As shown in Fig. 11, dip it in the curing apparatus, and record the first reading of the dial-gauge after the mould reaches equilibrium with respect to the water bath.

c) For curing, keep it at 80 ± 3°C for 6 h, then leave it to cool in the curing apparatus.

d) Repeat the operation **E-4.2** (c), one time per day for 10 days.

e) On finishing of the curing period, record the last reading of the dial-gauge, remove the gauge holder and the dial-gauge, take out the mould from water, tilt it gently with the perforated plate with shaft on it, and remove the accumulated water. Then, after leaving quietly for 15 min, remove the filter paper and measure the mass.

E-5 CALCULATION

The calculation of volumetric expansion ratio shall be made as follows:

a) The volumetric expansion ratio shall be calculated by the following formula, and be rounded off to the first decimal place:

$$E = 100 \times (D_f - D_i) / H$$

where

E = volumetric expansion ratio, percent,

D_f = last reading of the dial-gauge in mm,

D_i = first reading of the dial-gauge in mm, and

H = initial height of the specimen (125 mm).

b) The test shall be carried out on three specimens prepared from the sample taken at the same time in accordance with **E-3.2**, and the average of the three test results shall be taken. The averaged value shall be rounded off to the first decimal place.

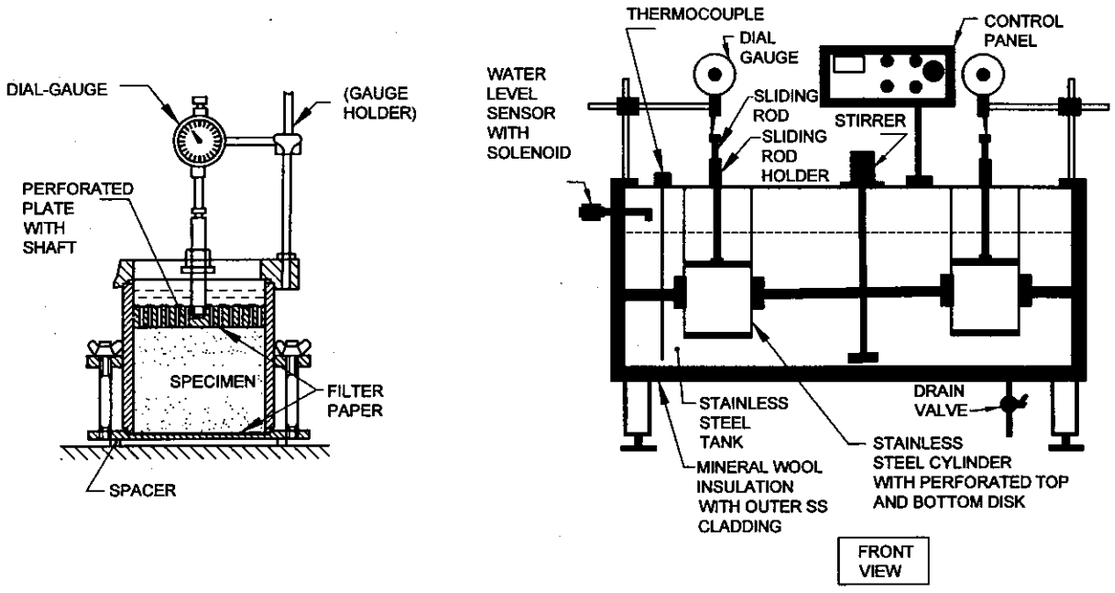

FIG 11: TEST SETUP FOR VOLUMETRIC EXPANSION TEST

Bureau of Indian Standards

BIS is a statutory institution established under the *Bureau of Indian Standards Act*, 1986 to promote harmonious development of the activities of standardization, marking and quality certification of goods and attending to connected matters in the country.

Copyright

BIS has the copyright of all its publications. No part of these publications may be reproduced in any form without the prior permission in writing of BIS. This does not preclude the free use, in the course of implementing the standard, of necessary details, such as symbols and sizes, type or grade designations. Enquiries relating to copyright be addressed to the Director (Publications), BIS.

Review of Indian Standards

Amendments are issued to standards as the need arises on the basis of comments. Standards are also reviewed periodically; a standard along with amendments is reaffirmed when such review indicates that no changes are needed; if the review indicates that changes are needed, it is taken up for revision. Users of Indian Standards should ascertain that they are in possession of the latest amendments or edition by referring to the latest issue of 'BIS Catalogue' and 'Standards : Monthly Additions'.

This Indian Standard has been developed from Doc No.: CED 02 (7992).

EAC OBSERVATION NO.-9

3345

EAC OBSERVATION:

Phospho-gypsum disposal site co-ordinates, concrete mode of utilization, maximum time frame envisaged for the storage at the disposal yard i.e., one month (or) 15 days has not been submitted.

REPLY:

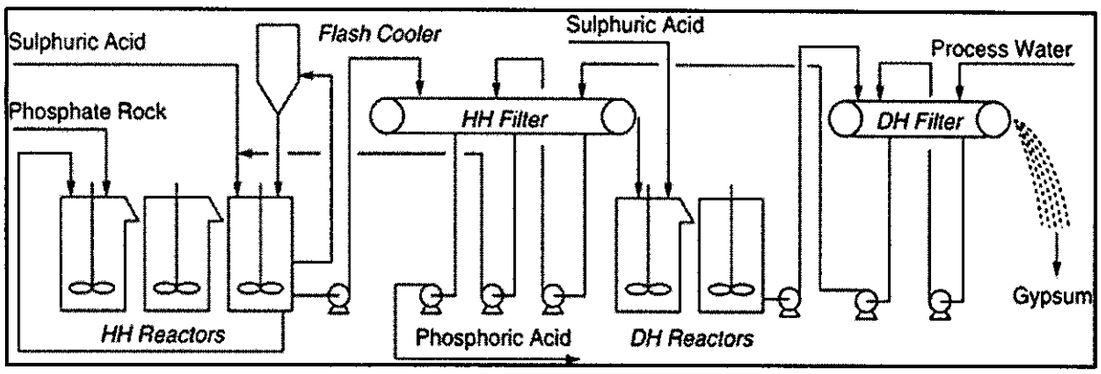
Phospho-gypsum disposal site co-ordinates are marked in plot plan and is attached in **Annexure-9(a)**

CRITERIA FOR PHOSPHO-GYPSUM STORAGE (AS PER CPCB GUIDELINE 2014-15)

Sr. No.	Description	Locational Criteria	Compliance
1	Lake or Pond	Distance more than 500 m	Storage-I: 850 m from nearest pond Storage-II: 830 m from nearest pond
2	Flood Plan	No construction 100 Year flood Plan	Since no flow data is available for Dhaneshwari Nadi, a tentative estimate of run-off from Dhaneshwari Nadi catchment and discharge at railway line near project site is done based on the catchment characteristics.
3	Habitation	Distance More than 1 km	Storage-I: 1350 m from Navinal Storage-II: 1950 m from Navinal

Phospho-gypsum is widely used in cement manufacturing. MoU's (attached as **Annexure-9(b)**) have been signed with following companies:

1) Adani Cementation Limited
2) Sanghi Cement Limited



Phospho-gypsum is also used for agriculture purpose and therefore efforts will be made to sell for the agriculture requirement.

Total Area allocated for storage of Phospho-gypsum is around 21 Acres. Gypsum will be stored to 15 meter height above the base of the storage. Greenbelt of 15 m width will be developed all around the storage area.

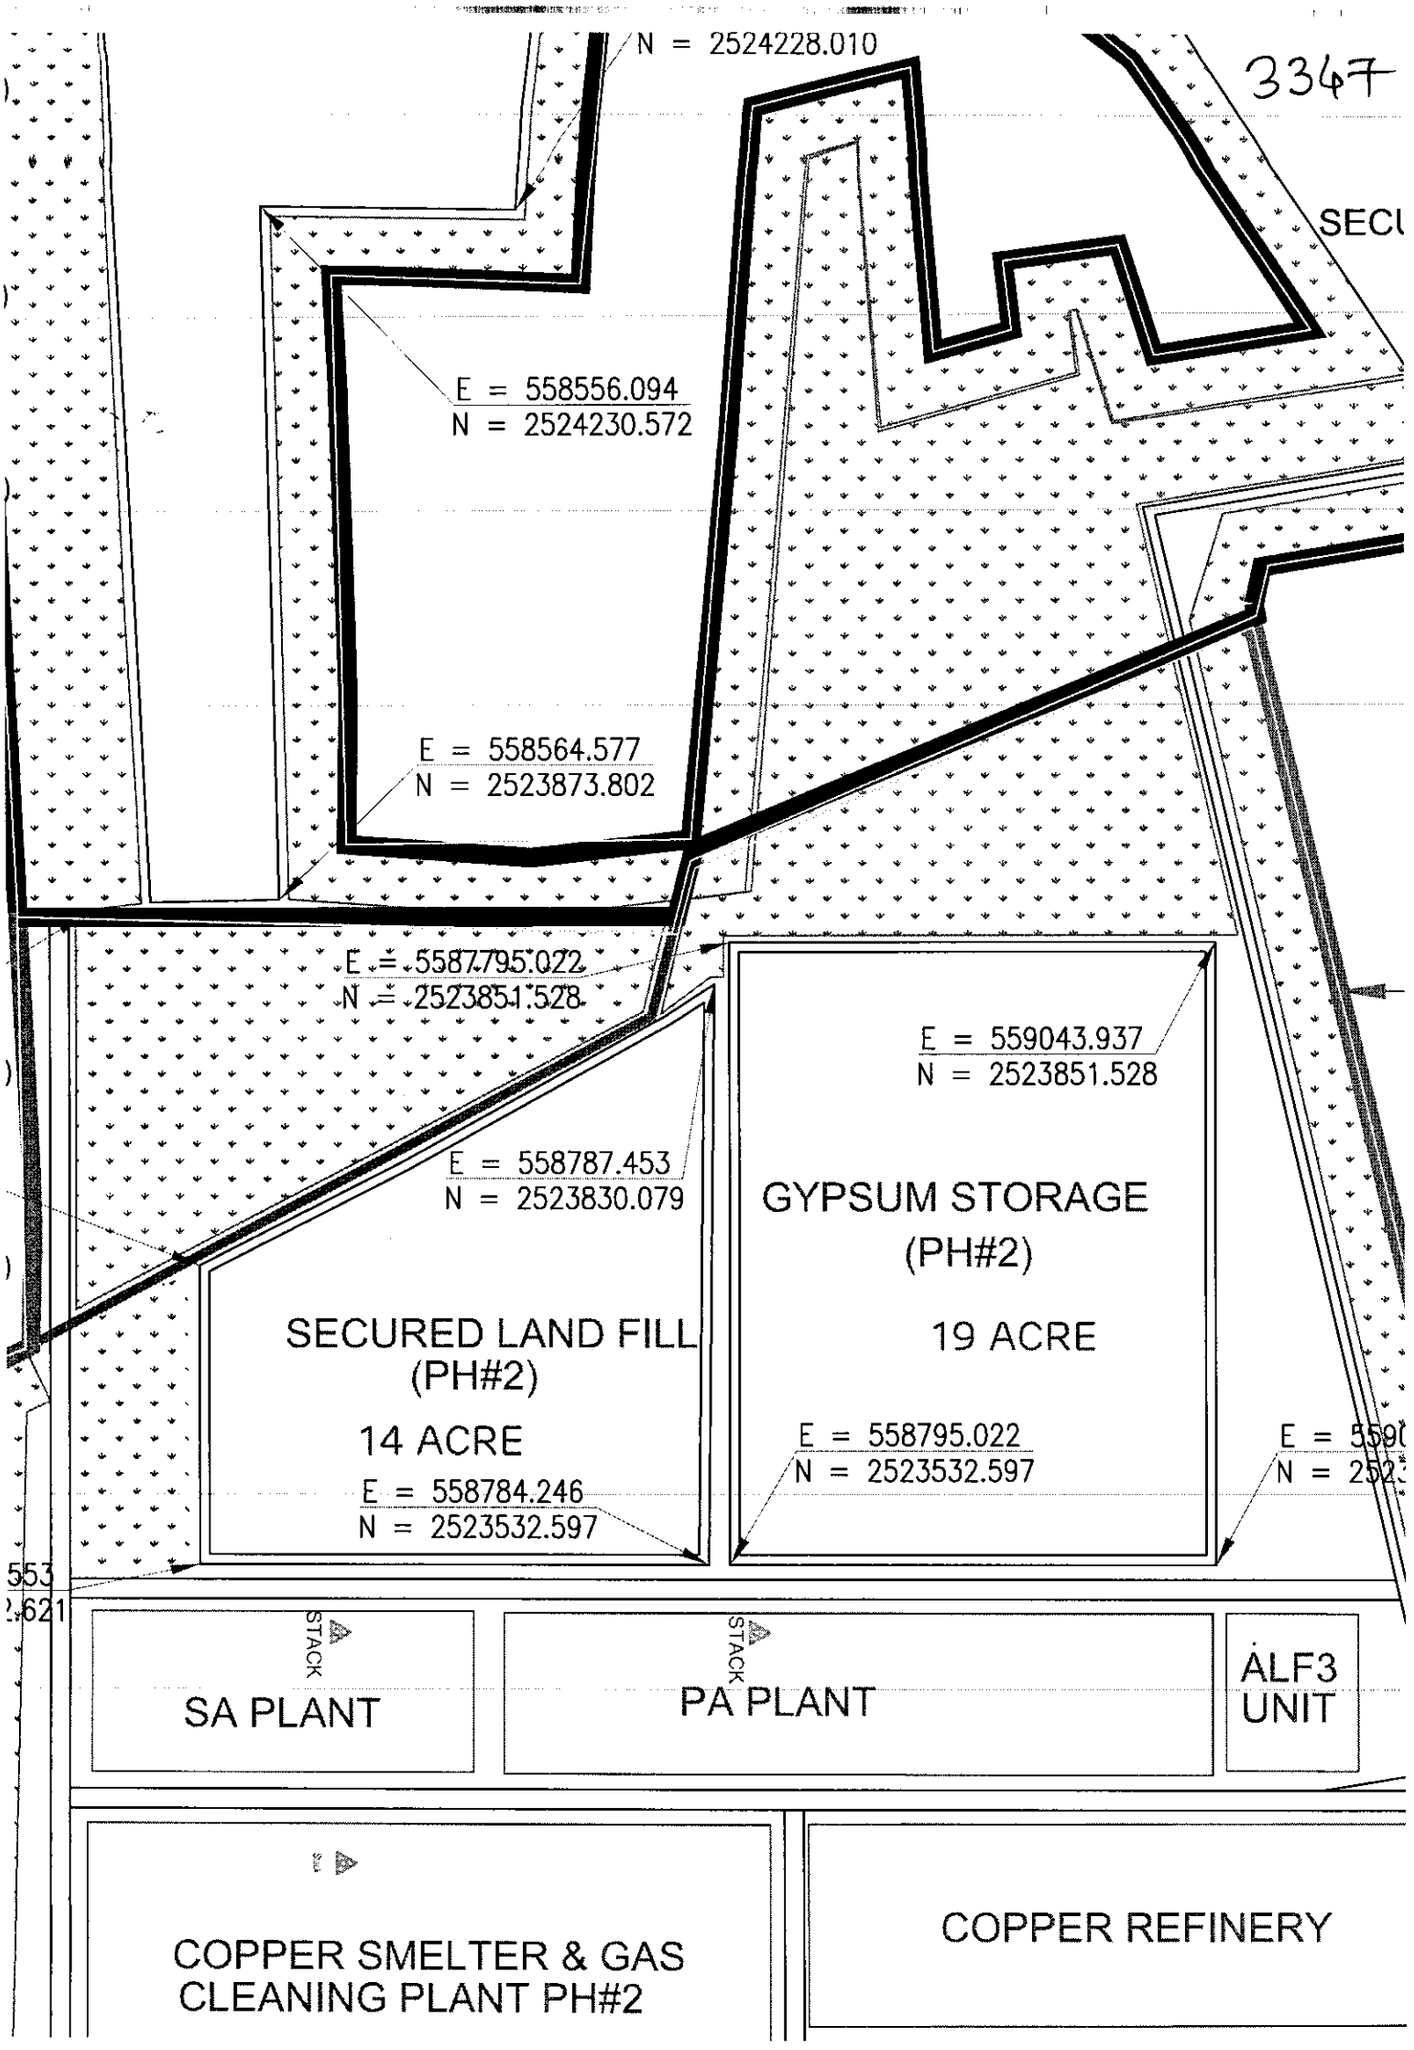
This area is sufficient for 3 years, considering NO sales.

Phosphoric Acid & Phospho-gypsum Manufacturing Process:

- Hemi-Di-Hydrate (HDH) process for manufacturing of the phosphoric acid.
- This process has unique advantage over the conventional process due to two stage of reaction and filtration (Please refer the diagram below), which produces very high quality phospho-gypsum, which is highly suitable for cement manufacturing, thereby reducing requirement of mined gypsum.

Stage 1 - Reaction & Filtration

Stage 2 - Reaction & Filtration



Stage 1: Production of 42% Phosphoric Acid as a product and generation of Phospho-gypsum with P_2O_5 ~ 1.5 %.

Stage 2: Further Recovery of P_2O_5 from 1st stage phospho-gypsum. Production of Superior Quality of Phospho Gypsum by further polishing by additional fresh water wash and reducing P_2O_5 < 0.5% in final phospho-gypsum product..

- The first reaction takes place under hemi-hydrate conditions, followed by filtration to obtain purer product acid of 40-42 percent P_2O_5. As usual, dilute acid from washing the cake returns to the primary reactor.
- The hemi-hydrate filter cake is then re-pulped at a lower temperature in dilute sulphuric acid and held for sufficient time for the hemi-hydrate to re-crystallize to the di-hydrate form. Any occluded rock phosphate particles exposed in the process dissolve in the additional sulphuric acid.
- This process produces a purer form of phosphor-gypsum and filtrate solutions, which are used to wash and re-pulp the hemi-hydrate filter cake.
- Acid with 42% P_2O_5 requires less energy for further evaporation to ~52% P_2O_5 before use for manufacturing of Di-Ammonium Phosphate (DAP), at a much higher P_2O_5 recovery efficiency,
- Typically, P_2O_5 Recoveries are ~98 percent compared to single stage process (~95%).

Typical phospho-gypsum quality produced from the HDH is as follows:

- Purity of Gypsum: >90%
- Total P_2O_5: <0.5%
- Total Fluorine: <0.6%
- Dispatch Phospho-gypsum Moisture: <10%

MEMORANDUM OF UNDERSTANDING (MOU) FOR SUPPLY OF PHOSPHO GYPSUM

THIS MOU is entered on this 31st day of December 2018 between **Adani Enterprises Limited,** a company registered under the Companies Act, 2013, and having its registered office at Adani House, Near Mithakhali Six Roads, Navrangpura, Ahmedabad 380009, Gujarat, India (hereinafter referred to as **"AEL"**, which expression shall, unless excluded by or repugnant to the context or meaning thereof, be deemed to include its successors and assigns) being the party of the **FIRST PART.**

AND

Adani Cementation Ltd, a Company registered under the Company's Act 2013 and having its registered office at Adani House, Near Mithakhali Six Roads, Navrangpura, Ahmedabad 380009, Gujarat, India (hereinafter referred to as **"ACL"** which expression shall, unless excluded by or repugnant to the context or meaning thereof, be deemed to include its successors and assigns) being the party of the **SECOND PART.**

Both AEL and ACL may hereinafter also be referred to jointly as the **'Parties'** and severally as a **'Party'**

WHEREAS

AEL is setting up 1 Million Copper Refinery Complex at Mundra, Gujarat (hereinafter referred to as "**CP**") and shall be generating in process, 2.5 Million Ton per annum quantity of Phospho-gypsum (hereinafter referred to as "**Gypsum**") which can be utilized in manufacturing cement, gypsum board fertiliser applications, etc.

AEL & ACL after discussion hereto have decided to enter into an MOU for utilizing this Gypsum in the ACL's cement plant.

NOW, THEREFORE, IN CONSIDERATION OF THE ABOVE PREMISES AND OF THE UNDERTAKINGS HEREIN FURNISHED, IT IS HEREBY AGREED BY AND BETWEEN THE PARTIES AS FOLLOWS:

1.0 AEL will make available to ACL 0.30 Million Ton per annum of cement grade Gypsum that will be generated from its CP from the commercial date of operation. The delivery schedule and the other commercial terms & conditions will be mutually decided by both the parties at a date closer to the commercial date of operation.

2.0 AEL & ACL shall discuss the further steps to be taken in order to carry out the purpose of this MoU. Both the parties will endeavour to finalize and enter into such requisite Agreements, as may be necessary in line with the related rules, regulation and notifications of State/Central Government Department/Agencies.

EFFECTIVE DATE, COMMENCEMENT DATE & VALIDITY OF THE MOU

1.0 The effective date shall be the date of this MOU.

2.0 This MOU shall remain valid till the time a definitive detailed agreement incorporating all the commercials, scope, penalty and legal related matters is executed between the parties.

ADANI ENTERPRISES LTD AHMEDABAD

ADANI CEMENTATION LIMITED AHMEDABAD

3349

TERMINATION

1.0 Any party may terminate this MoU by giving thirty (30) days' notice to the other party during the tenure of this MoU.

SETTLEMENT OF DISPUTES

1.0 In case of any disputes, differences, claims between the parties hereto arising out of this MoU, the same shall be referred to the senior management of each Party for an amicable settlement.

OTHER CONDITIONS:

1.0 Any amendment to this MoU in order to be valid shall be in writing.

2.0 This MoU shall be executed in duplicate and both the counterparts shall be treated as original.

IN WITNESS WHEREOF THE .PARTIES HERETO HAVE HEREUNTO SET THEIR RESPECTIVE HANDS AND SEALS THE DAY, MONTH AND YEAR FIRST ABOVE WRITTEN.

MEMORANDUM OF UNDERSTANDING (MOU) FOR SUPPLY OF PHOSPHO GYPSUM

This MOU is entered on this 24th Day of January 2019 between **Adani Enterprises Limited,** a company registered under the Companies Act, 2013, and having its registered office at Adani House, Near Mithakhali Six Roads, Navrangpura, Ahmedabad 380009, Gujarat, India (hereinafter referred to as **"AEL"**, which expression shall, unless excluded by or repugnant to the context or meaning thereof, be deemed to include its successors and assigns) being the party of the **FIRST PART.**

AND

Sanghi Cement Ltd, a Company registered under the Company's Act 2013 and having its office at 10th Floor, Kataria Arcade, Off S.G. Highway, Makarba, Ahmedabad-380051, India (hereinafter referred to as **"SANGHI"** which expression shall, unless excluded by or repugnant to the context or meaning thereof, be deemed to include its successors and assigns) being the party of the **SECOND PART.**

Both AEL and SANGHI may hereinafter also be referred to jointly as the **'Parties'** and severally as a **'Party'**

WHEREAS

AEL is setting up 1 Million Copper Refinery Complex at Mundra, Gujarat (hereinafter referred to as "**Project**) and shall be generating in process, 2.5 Million Ton per annum quantity of Phospho-gypsum (hereinafter referred to as "**Gypsum**") which can be utilized in manufacturing cement, gypsum board fertiliser applications, etc.

AEL & SANGHI after discussion hereto have decided to enter into an MOU for utilizing this Gypsum in the SANGHI's cement plant.

NOW, THEREFORE, IN CONSIDERATION OF THE ABOVE PREMISES AND OF THE UNDERTAKINGS HEREIN FURNISHED, IT IS HEREBY AGREED BY AND BETWEEN THE PARTIES AS FOLLOWS:

1.0 AEL will make available to SANGHI the cement grade Gypsum that will be generated from its Project from the commercial date of operation. Currently, SANGHI consumes around 0.20 MTPA of Gypsum in their manufacturing process which is likely to be increased to about 0.40 MTPA after their capacity expansion. The quantity, delivery schedule and the other commercial terms & conditions will be mutually decided by both the parties at a date closer to the commercial date of operation.

2.0 AEL & SANGHI shall discuss the further steps to be taken in order to carry out the purpose of this MoU. Both the parties will endeavour to finalize and enter into such requisite Agreements, as may be necessary in line with the related rules, regulation and notifications of State/Central Government Department/Agencies.

EFFECTIVE DATE, COMMENCEMENT DATE & VALIDITY OF THE MOU

1.0 The effective date shall be the date of this MOU.

2.0 This MOU shall remain valid till the time a definitive detailed agreement incorporating all the commercials, scope, penalty and legal related matters is executed between the parties.

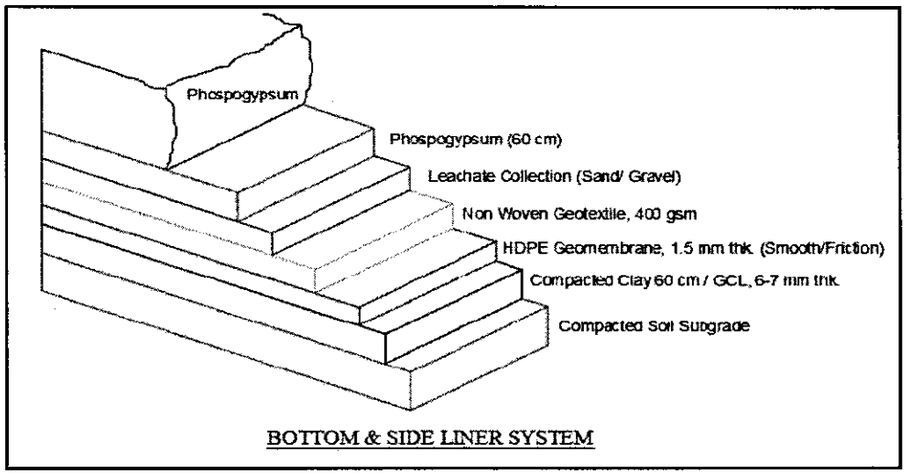
EAC OBSERVATION:

Lining details for Phospo-gypsum disposal yard, leachate collection system envisaged and details of piezo-well installations has not been made available.

REPLY:

Phosphogypsum storage yard will be developed strictly as per CPCB Guidelines for Management and handling of phosphor-gypsum.

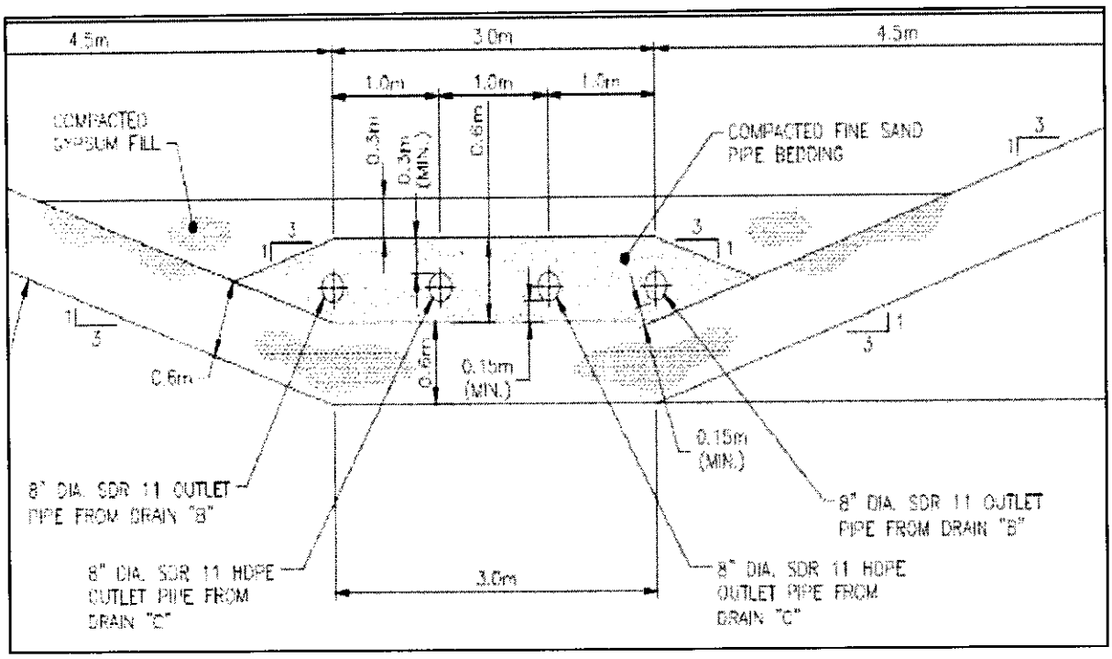


M/s. Garware Technical Fibres Limited (Geosynthetics Division), Pune; has been engaged for preliminary design for construction of gypsum storage yard. Technical report is attached as **Annexure-10(a).**

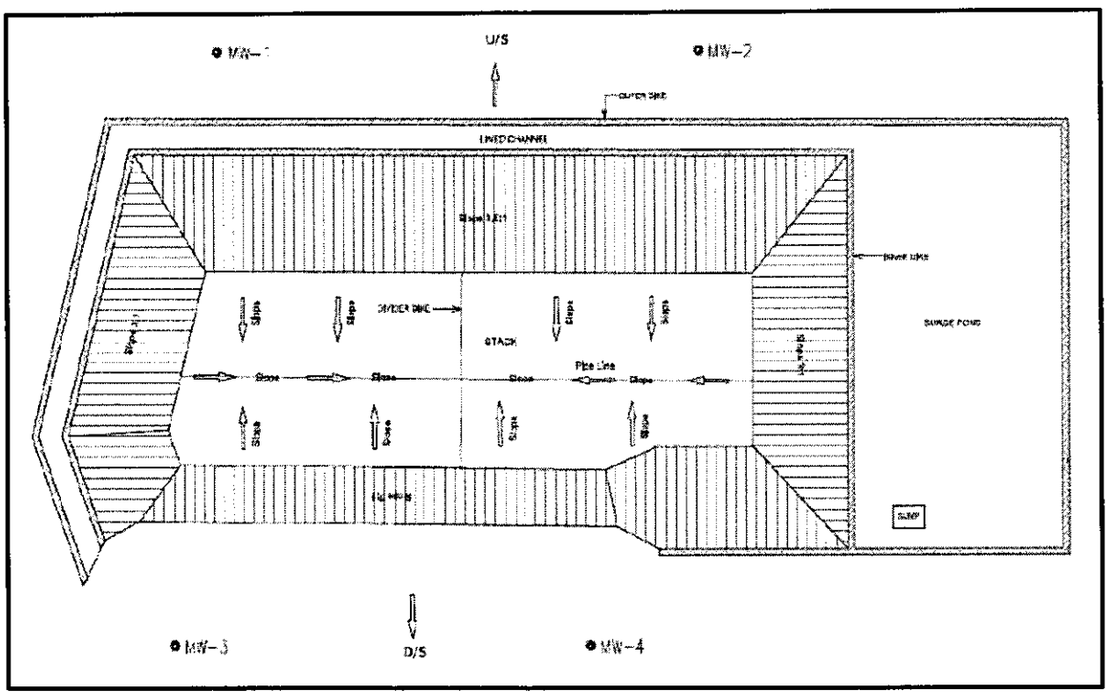
The thickness of the liner shall be 1.5 mm thick (min) with minimum width of 7.5 m and length of 150 m to reduce the number of joints. Understanding the seriousness of the project Naue –Germany/Equivalent -GSE-Germany make shall be used. HDPE liner make will be laid at the prepared base areas as well as on the dike slopes. A detailed technical specifications has been provided as a part of the technical proposal attached.

Leachate collection system shall be installed and leachate will be recycled back into Phosphoric Acid Plant. Capacity of the leachate collection (Gypsum Return Water Pond) will be ~3000 m^3 per Gypsum storage.

Considering hydrogeology study conducted for this project and solid waste storage locations in the plot layout, piezo well locations have been identified and marked on the plot plan as per **Annexure-10(b).** Additionally, there will be 2 nos. of rainwater collection pond having capacity of 4,000 m^3 from gypsum storage runoff.



Phospho-gypsum will be stacked in the Gypsum storage yard with a dry stacking method. Phospho-gypsum from the plant will be transported to gypsum storage area by a conveyor system and tippers will be used to spread the phospho-gypsum within the storage area. Leachate collected from the gypsum storage area will be pumped to phosphoric acid plant through a piping system for consumption within the process.



PHOSPHO-GYPSUM STORAGE AREA LINER SYSTEM

3353

EAC OBSERVATION NO.-10

PHOSPHO-GYPSUM STORAGE LEACHATE DRAIN SYSTEM

LEACHATE COLLECTION AND RECYCLING SYSTEM

To collect and convey the leachate to the collection sump and leachate collection system will have the following:

1) Drainage layer.
2) A perforated pipe collector system.
3) Sump collection area.
4) Removal of the leachate.

The leachate drainage is usually achieved using graded under-liner and drains which lead to a collection system/surge pond leading to a sump. From the sump, it is pumped back to phosphoric acid plant for consumption.

A typical layout of the stack area, leachate Channel and surge pond is shown below:

PHOSPHOGYPSUM STORAGE AREA LINER SPECIFICATION

Liner Make: Naue, Germany
Thickness: 1.5 mm-Smooth, Length:150 m, Width:7.5 m

Property	Test Method	Unit	Value
Thickness Nominal	EN-1849-(2)/ASTM D 5199	mm	1.50

1 Cover Note

With reference to the subject cited above, it give us pleasure to receive the enquiry and would like to place on record our desire to associate in the subject project for the construction of the Geosynthetic Lined Gypsum Stack construction. Sir, we at Garware Technical Fibres Ltd (GTFL)-Geosynthetics Divn have been striving tirelessly to Design, supply, install and commission the best Environmental protection Structures for the Waste/Process residue management for the industries as well as municipal corporations. We are also working in many diverse areas of Ground/Geotechnical/Geo-environmental engineering with prime focus on environmental protection, resource Conservation. In specific to the complexity of the project which Adani Enterprises Ltd is planning to undertake, we would like to put forth the following points

GTFL has been associated with similar Phosphogymsum Stack projects in the past for Coramnadal Fertilizers, Paradeep Phosphate and IFFCO (2006-2010).We are also executing Phosphogymsum Stack expansion for Paradeep Phosphate Ltd and IFFCO as per CPCB Guidelines-2014. GTFL has also been involved in design, engineering and execution of large number of Secure Landfill Projects for its customers including Indian Oil, Sterlite Industries, Cairn Energy, HZL, Vedanta Aluminium Ltd, Pimpri Chinchwad Municipal Corporation, KMML-Kerala to name a few.

We have also knowledge of the legal and statutory requirements of the project of such nature and have been associated with various Pollution Control Boards on behalf of the industry and thereby handling and holding hand in explaining the technicalities and compliance related issues.

Above all, our experience of past **20 years in Geosynthetic Lining and related construction with cutting edge technology** has always given industry the confidence to associate with us.

We would be pleased to associate with you to deliver the best available design, products and services for your project

We are also sure that your company will be equally interested to give us an opportunity to demonstrate our Supply/Service capability for the subject project.

2 Brief about Phosphogypsum Stack

The following pages gives only brief outline of key elements of the Phosphogypsum Stack for explanation purpose which Adani Copper Refinery is proposing. Adani Copper Refinery is proposing to construct at its upcoming Copper Refinery located at Mundra, Gujarat. At a later stage, detailed engineering, planning including drawing, material specifications shall be made and the same shall be submitted for approval before starting of the construction of the facility.

2.1 Phosphogymsum Stack Layout

The construction of Phospo Gypsum Stack facility at Adani Copper Refinery site is proposed to be executed with detailed planning and engineering, design of the facility. Broadly it shall consist of Access Road, Perimeter Road, Electrical Lighting, outer/perimeter embankment, inner embankment for disposal of the gypsum, installation of various Geosynthetics materials. drainage trench, outlet and lined channels around the gypsum stack, installation of the Geosynthetic materials, air vent system on the prepared base areas, installation of a 1.5 mm thick smooth & friction high density polyethylene (HDPE) liner-Naue Germany make and as per European standards on the inboard perimeter dike slopes and prepared base areas and construction of the under drains and outlets.

2.2 Site Investigation Criteria

2.2.1 Preliminary Boreholes and Geophysical Investigation:

At each site, as a part of preliminary data collection, one to two boreholes will be drilled and samples collected at every 1.5m interval to a depth of 20m below the ground surface. The following information will be obtained:

(a) soil type and stratification;

(b) permeability of each strata;

(c) strength and compressibility parameters (optional);

(d) ground water level & quality and depth to bedrock.

In addition to preliminary boreholes, geophysical investigations (electrical resistivity/seismic refraction/others) will be undertaken to assess the quality of bedrock at different sites.

A detailed site investigation program will comprise of

(a) subsoil investigation,

(b) ground water/hydrogeological investigation.

(c) hydrological investigation,

(d) topographical investigation and

(e) geological investigation.

The output expected from each investigation is listed below:

a) **Subsoil Investigation:** A detailed investigation plan may be drawn up in consultation with a geotechnical engineer The output from such an investigation should yield the following:

   (i) Stratification of subsoil -type of soil and depth

   (ii) Depth to ground water table and bedrock (if located within 15m of base of landfill)

   (iii) Permeability of various strata beneath the landfill.

   (iv) Strength and compressibility properties of subsoil

(v) Extent of availability of liner material, drainage material, top soil and protective soil in adjacent borrow areas.

(vi) Subsoil properties along approach road.

A minimum of 3 boreholes per hectare of landfill area upto 15m beneath the base of the landfill shall be drilled and in-situ tests as well as laboratory tests shall be performed for permeability, strength, compressibility and classification of soils.

In addition, test pits and boreholes shall be drilled at borrow area for liner and cover materials as well as along approach road.

b) **Ground Water/ Hydrogeological Investigation:** A detailed investigation plan may be drawn up in consultation with a ground water specialist or a hydrogeologist. The output from such an investigation should yield the following:

(i) Depth to groundwater table and its seasonal variations.

(ii) Ground water flow direction

(iii) Baseline ground water quality parameters -all drinking water quality parameters.

c) **Topographical Investigation:** Construction of a landfill involves a large quantity of earthwork. It is essential to have an accurate topographical map of the landfill site to compute earthwork quantities precisely. A map of 0.3m contour interval is considered desirable.

d) **Hydrological Investigation:** The objective of a hydrological investigation is to estimate the quantity of surface runoff that may be generated within the landfill to enable appropriate design of drainage facilities. If additional run off from areas external to the landfill is likely to enter the landfill, this quantity should also be estimated to design interception ditches and diversion channels. Such an investigation shall yield estimates of peak flows if seasonal rivers or streams run close to the site hydrological investigation should indicate the possibility of flooding of the site under one in 100 year flood flows. Surface water samples for water quality analysis may be collected from dUring hydrological studies.

e) **Geological Investigation and Seismic Investigation:** Geological investigations shall delineate the bedrock profile beneath the landfill base, if not confirmed by subsoil investigations. Geophysical surveys may be designed in consultation with a geologist. In hilly areas or in quarried rocks. Geological investigations should indicate the quality of surficial rock, depth to sound rock and the possibility of interconnected aquifers beneath the landfill base In the rock mass. Detailed seismic data may be obtained as a part of geological investigations.

2.2.2 Base Stability, Slope Stability and Seismic Aspects:

For landfills construction on the soil, the base will be checked for stability against bearing failure or excessive settlements.

The stability of side slopes of a landfill shall be checked for the following cases (Fig. 9).

(a) stability of excavated slopes

(b) stability of liner system along excavated slopes

(c) stability of temporary waste slopes constructed to their full height (usually at the end of a phase)

(d) stability of slopes of above-ground portion of completed landfills

(e) stability of cover systems in above ground landfills.

The stability analysis shall be conducted using the following soil mechanics methods depending upon the shape of the failure surface

(a) failure surface parallel to slope;

(b) wedge method of analysis;

(c) method of slices for circular failure surface and

(d) special methods for stability of anchored geomembranes along slopes.

In preliminary design of a landfill section, the following slopes will be adopted.

(a) Excavated soil slopes (2.5 horizontal : 1 vertical)

(b) Temporary waste slopes (3.0 horizontal : 1 vertical)

(c) Final cover slopes (4.0 horizontal : 1 vertical)

Slopes can be made steeper, if found stable by stability analysis results. Acceptable factors of safety may be taken as 1.3 for temporary slopes and 1.5 for permanent slopes.

In earthquake prone areas, the stability of all landfill slopes shall be conducted taking into account seismic coefficients as recommended by BIS codes.

2.3 Lining System

2.3.1 Bottom Liner System

The lining system is additional to the separation or unsaturated zone comprising soil or sand between the wet season high elevation of the ground water and the stack yard. These liner consist of native clayey soil/amended soil/ad-mixture soil. The permeability of the soil / amended soil should be less than or equal to 1×10-7 cm/sec. As an alternative to clay Geosynthetic Clay Liner made from Natural Sodium Bentonite sandwitched between two layer of Geotextile known as Bentofix made by Naue-Germany meeting the regulatory requirement may be used.

A schematic cross section of the bottom Liner system is given in **Figure 1**.

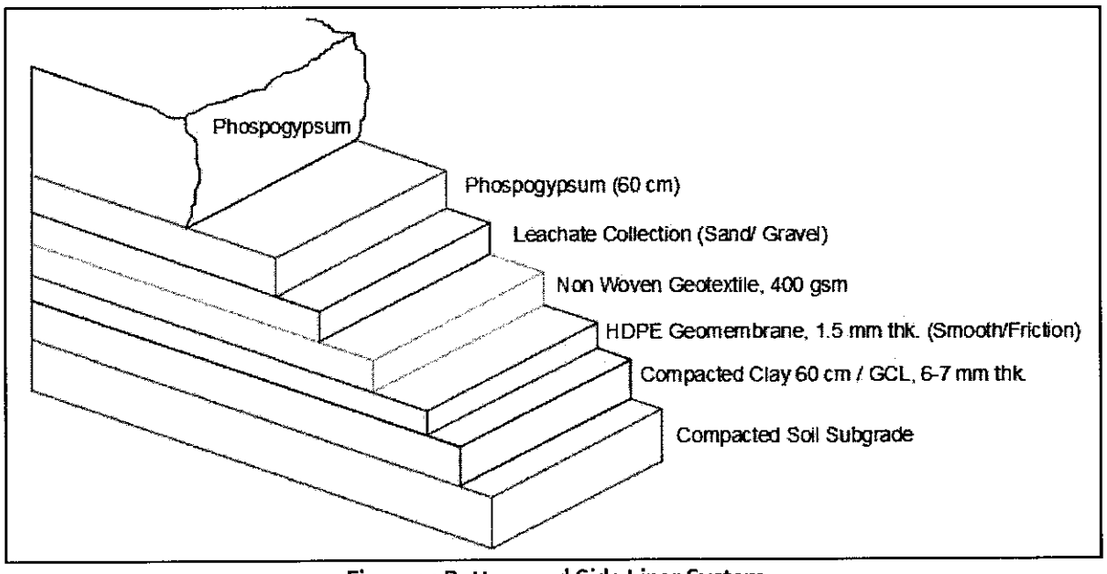

Figure 1: Bottom and Side Liner System

2.3.1.1 Geomembranes

These are flexible sheets made from various plastic materials. The recommended liner along the side as well as the bottom of the facility is HDPE Liner. HDPE lining is effected by overlapping the strips and joining them with a special welding technique.

The thickness of the liner shall be 1.5 mm thick (min) made through flat cast extrusion technology to keep the thickness variation across the rolls to less than 5% and the minimum width of the membrane shall not be less than 7.5 m and length shall not be less than 150 m to reduce the number of joints. Understanding the seriousness of the project Naue –Germany / Equivalent -GSE-Germany make has been recommended for use. Detailed Material Specifications are given in the annexure. Equivalent product's details must be shown to the Technical Engineer for review of its properties/performance.

2.3.1.2 Protection Layer (Non Woven geotextile)

To protect the geo membrane against the mechanical stress and failure thereby, non-woven needle punched Geo textile manufactured through mechanically bonding and made from continuous fibres/filaments and made of 100% UV stabilized Polypropylene is to be used on the HDPE Liner on the bed as well as the slopes. For the protection purpose, 400 gsm overlay Non-Woven Geotextile has been recommended. Equivalent product's details must be shown to the Technical Engineer for review of its properties/performance. The minimum width of the Non Woven Geotextile shall be 4 m and minimum length shall be 90.0m.

2.3.1.3 Drainage Layer

The Gypsum Stack facility essentially generates significant quantity of leachate due to inherent moisture present in the waste body and the rain water precipitation. This leachate is impregnated with harmful chemicals and pollutants. This is to be collected, removed from the facility and treated. In order to collect the leachate from the waste body a Drainage layer of 30 cm granular material of permeability>1*10-2 cm/sec is put over the protective layer of Geotextiles.

Looking at the following aspects of the Gypsum Stack the following drainage medium has been recommended:

(a) Structural profile and geometry

(b) Bottom and side slope pattern

(c) Performance of various geological and synthetic material for drainage function

Hence for the side slope geocomposite drainage net and for the bottom slopes, Sand/gravel as a drainage medium for the primary and secondary layer of desired specification has been recommended.

2.3.2 Side liner system of Gypsum Stack

The side liner system is on the inner side of soil bunds with slope 1:3 (V: H).The construction procedure of each layer of sideliner system is shown in Figure No: 02.

GCL-Bentofix-Naue Germany make of minimum 6-7mm thickness with powdered bentonite to be used instead of compacted clay as the slope is not so gentle and it is difficult to compact the clay on steep slope.

Moreover on the Non-Woven Geotextile, Geocomposite Drainage Net shall be used as a Drainage Medium instead of Sand/ Gravel. **A schematic sketch of the side liner system anchoring with gas venting system is shown in Figure 2.**

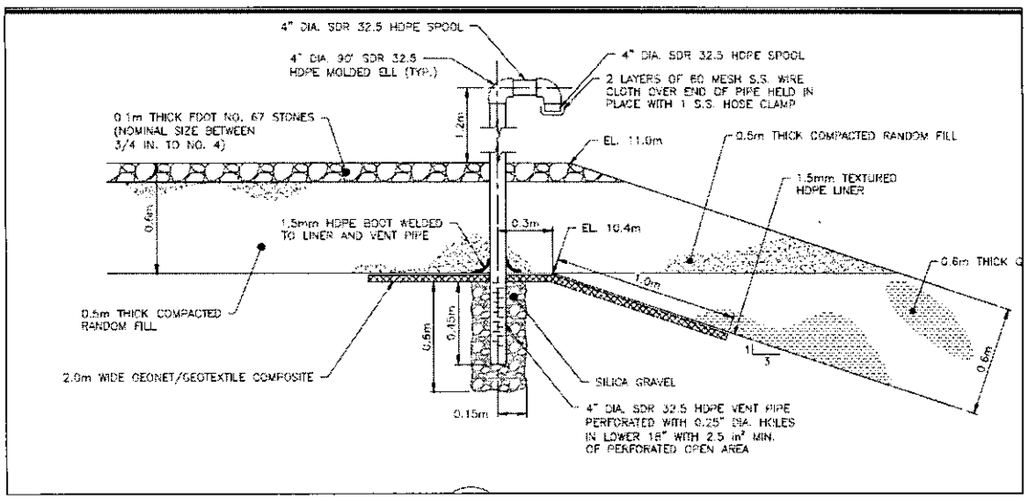

Figure 2: Side Liner System

2.4 Leachate Drainage, Collection & Removal System

In order to collect and convey the leachate generated to the collection sump, a Leachate collection System has been designed. It comprises of the following:

(a) Drainage Layer.

(b) A Perforated Pipe Collector System.

(c) Sump Collection Area.

(d) Removal of the leachate.

The leachate drainage is usually achieved using graded under-liner and drains which lead to a collection system/ Surge Pond leading to a sump. A typical layout of the stack area, leachate Channel and surge pond is shown in **Figure 3**.

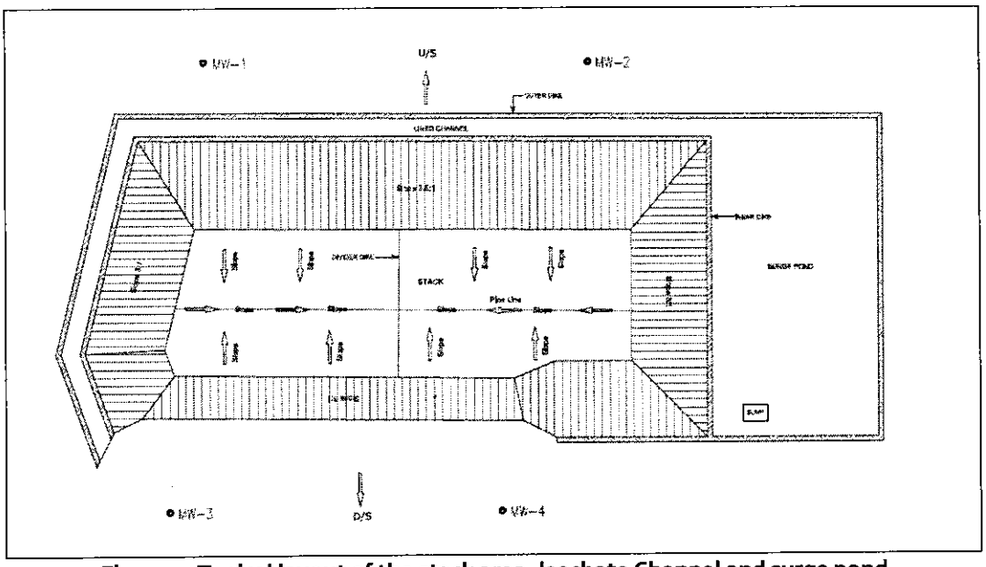

Figure 3: Typical layout of the stack area, leachate Channel and surge pond

The technical details of the leachate drainage are as under:

Thickness of the Drainage Layer should be designed in such a way so that, the leachate can be evacuated quickly. Broadly, 150 mm for arterial pipes for collecting and 200 mm main header line for transporting the leachate from the body of Gypsum stack would be able to carry the leachate to the sump. Gravel/Sand to be used for the smooth drainage of the leachate from the stack area to the piping system. A typical drain section is shown in **Figure 4**.

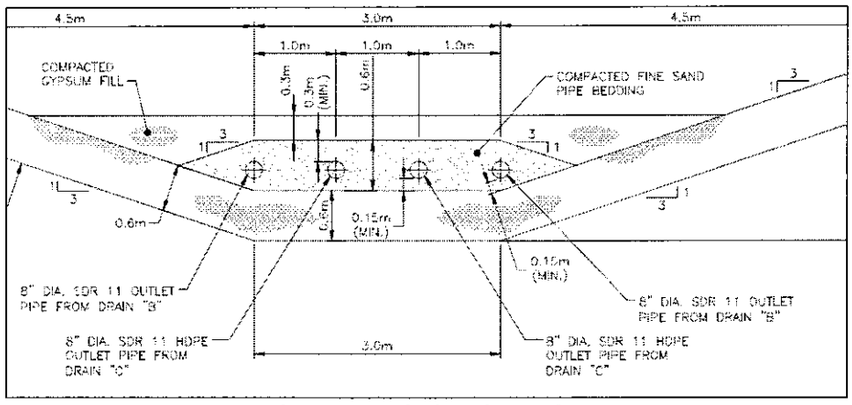

Figure 4: Typical Drain Section

2.5 Construction of Embankment

Embankment shall be designed based on sound engineering practices and also shall be checked for slope stability analysis considering seismic factors of Mundra-Gujarat region.

The embankment shall be constructed to the lines and grades shown on the drawings. Placement of fill shall be performed in an orderly way and in an efficient and workman like manner, so as to produce fills having such quantities of density, strength and permeability as will ensure the highest practicable degree of stability and performance of the embankment.

The slopes of embankment shall be maintained as per specific structures drawing.

2.5.1 Fill Materials

The materials for embankment shall be obtained from the available excavated material. Some earth material available from the excavation in the pond area if found suitable will also be used for the embankment construction. Morrum / Yellow soil or soil which satisfy the accepted civil engineering property of the bund construction shall be accepted.

2.5.2 Placing the fill material Compaction of the Embankment and Base: (IS: 2720)

The combined excavation and placing operations shall be such that the materials when compacted in the fill will be blended sufficiently to produce the specified degree of compaction and stability. The earth obtained from a particular borrow area as far as possible shall be used in forming the complete cross-section of the fill for a particular stretch.

No stones cobbles or rock fragments, having maximum dimensions of more than 5 cm shall be placed in the fill. Such stones and cobbles shall be removed either at the borrow pit or after being transported to the site but before the materials in the fill are rolled and compacted. Such stones or cobbles shall be placed in other portions of embankment if found suitable or rejected as directed. The materials shall be placed in the fill in continuous horizontal layers, stretching right across the whole section, not more than 0.4 m in compacted thickness

Vibratory rollers/static roller shall be used for compacting cohesive materials and pneumatic rollers and vibratory rollers shall be used for compacting cohesion less materials. The compaction in

horizontal layers will be done using standard compaction equipment or in inclined layers using slope compactors/appropriate method.

2.6 Inspection Test

Control tests shall be carried out in laboratory from time to time to determine whether the earth produced by methods employed satisfies the requirements of the specifications and documented for verification by the Officer- in –Charge of the regulatory authority and the work shall be inspected periodically.

Complete documentation of all quality control records and their submission to the GPPCB along with showing satisfactory achievement of acceptance criteria.

The quality control tests for compacted clay layer (or amended soils) as well as the leachate collection/drainage layer will include

(a) In-situ density tests.
(b) in-situ moisture content tests.
(c) Compaction tests.
(d) Permeability tests,
(e) Grain size distribution tests and
(f) Atterberg's limits tests
(g) Others as defined by GPCB.

The quality control tests for geomembrane liners shall be carried at as per QA/QC protocol and shall include the following:

(a) Thickness tests,
(b) Density tests,
(c) Strength tests,
(d) Field seam strength & leak tests

The Officer- in -Charge shall determine whether the desired results are being obtained.

Dressing and Trimming of the slopes

The outer slopes of the embankment shall be neatly dressed to line. Compaction shall extend over the full width of the embankment and the material in the slopes shall be compacted as for the rest of structure. To ensure proper compaction at the outer edge, the fill shall be constructed for a minimum of 0.5 m/1.0m extra width on either edges or the outer edge dressed to true width and slope after compaction. No earth slope shall be left without trimming to design slope.

2.7 Design of Storm Water Drain:

The catchment includes the top or cap of the Gypsum Stack facility as well as the outer slope of embankment and site upto fencing. Hence to divert the incoming water at the surface level as well as the slope and terraces of the Gypsum Stack facility, adequate storm water drainage channels need to be designed, constructed. The channel has to ultimately carry water to the storm water pond for storage or evaporation purpose in case not discharged outside.

2.8 Surface Water Drainage System

Surface water management shall be designed to ensure that rainwater run-off does not drain into the waste from surrounding areas and that there is no waterlogging/ponding on covers of landfills. A schematic surface water drainage system comprising of channels, drains, culverts and basins (Fig8) shall be designed to ensure the following:

(a) Rainwater running off slopes above and outside the landfill area shall be intercepted and channelled to water courses without entering the operational area of the site. This diversion channel may require a low permeability lining to prevent leakage into the landfill
(b) Rain falling on active tipping areas shall be collected separately and managed as leachate, via the leachate collection drain and leachate collection sumps to the leachate treatment and disposal system.
(c) Rainfall on areas within the landfill site, but on final covers of phases which have been completed and are not actively being used for waste disposal shall be diverted in drainage channels away from active tipping areas, and directed through a settling pond to remove suspended silt, prior to discharge.
(d) Any drainage channels or drains constructed on the restored landfill surface shall be able to accommodate settlement, resist erosion and cope with localised storm conditions.
(e) The horizontal surface of the final cover shall be provided a slope of 3 to 5% for proper surface water drainage. The slope of the cover on the sides will be higher and governed by slope stability considerations
(f) All Interceptor channels, drainage channels and settling ponds (storm water basins) shall be designed by a hydrologist using hydrometerological data.
(g) It shall be ensured that water collected by surface water drainage system and leachate collected by the leachate collection system do not get intermixed at any stage of collection or storage This shall apply to the 'active' and 'post closure' periods of the landfill

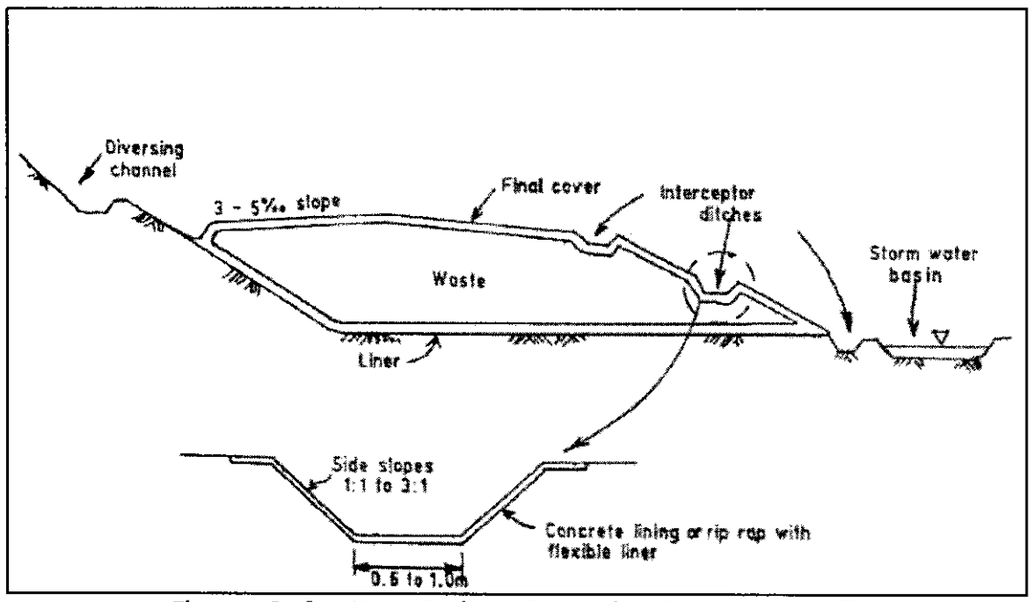

Figure 5: Surface Water Drainage System for a Completed Landfill

The design of following components will be undertaken:

(a) storm water drains, diversion channel
(b) storm water basin
(c) culverts if required

2.9 Piezometric Well

Piezometer shall be constructed to monitor the quality of groundwater. Two piezometers shall be installed on the downstream side of the SLF. Two piezometers shall be installed on the upstream side of the Gypsum Stack. At present, possible locations have been shown where the installation cane be done. But, exact location of the monitoring well shall be finalized in consultation with Gujarat State Pollution Control Board. The piezometer consist of a stand pipe made up of stainless steel/PVC which shall be screened along the entire aquifer depth i.e. the standpipe shall be- screened from a depth of 1 m to 10m or depending on ground water depth. The screened interval shall be encased in a filter zone made up of gravel and sand layer. The function of the filter zone is to allow free flow of groundwater into and out of standpipe and prevent fines from entering the standpipe. Immediately above the screened interval, a clay and bentonite seal shall be placed. The thickness of clay seal shall be 0.5 m. Above the clay and bentonite seal, a grout seal consisting of cement and bentonite shall be constructed which provides a barrier for preventing surface water and ground water from elsewhere from migrating into the screened interval. At the ground level, a steel casing embedded in concrete pad shall be employed. A cap shall be placed on the top of steel casing to prevent rainwater and surface water from entering into the standpipe. The piezometer shall be constructed at a minimum distance of 7 m from outside edge of the embankment. A schematic sketch of a Piezometer is shown in **Figure 6**. The location is shown in figure no 4.

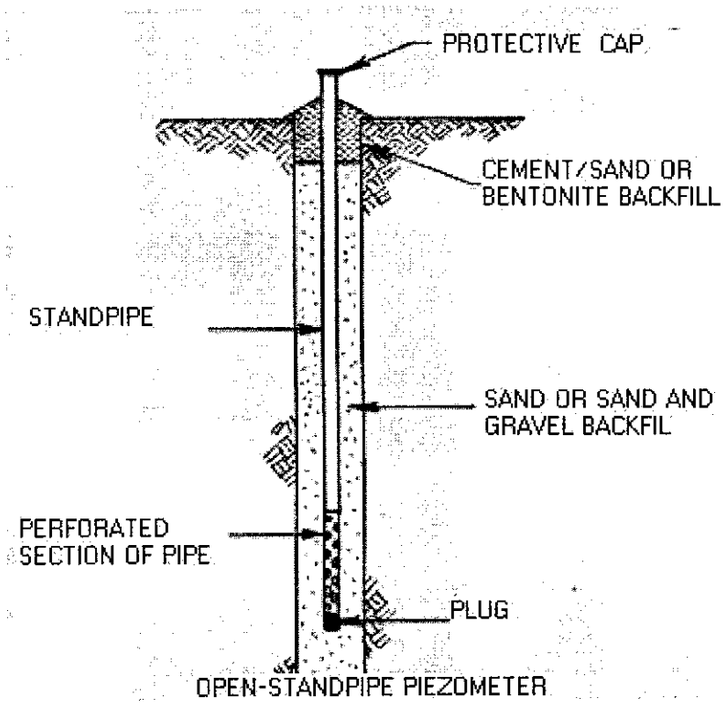

Figure 6: Piezometer

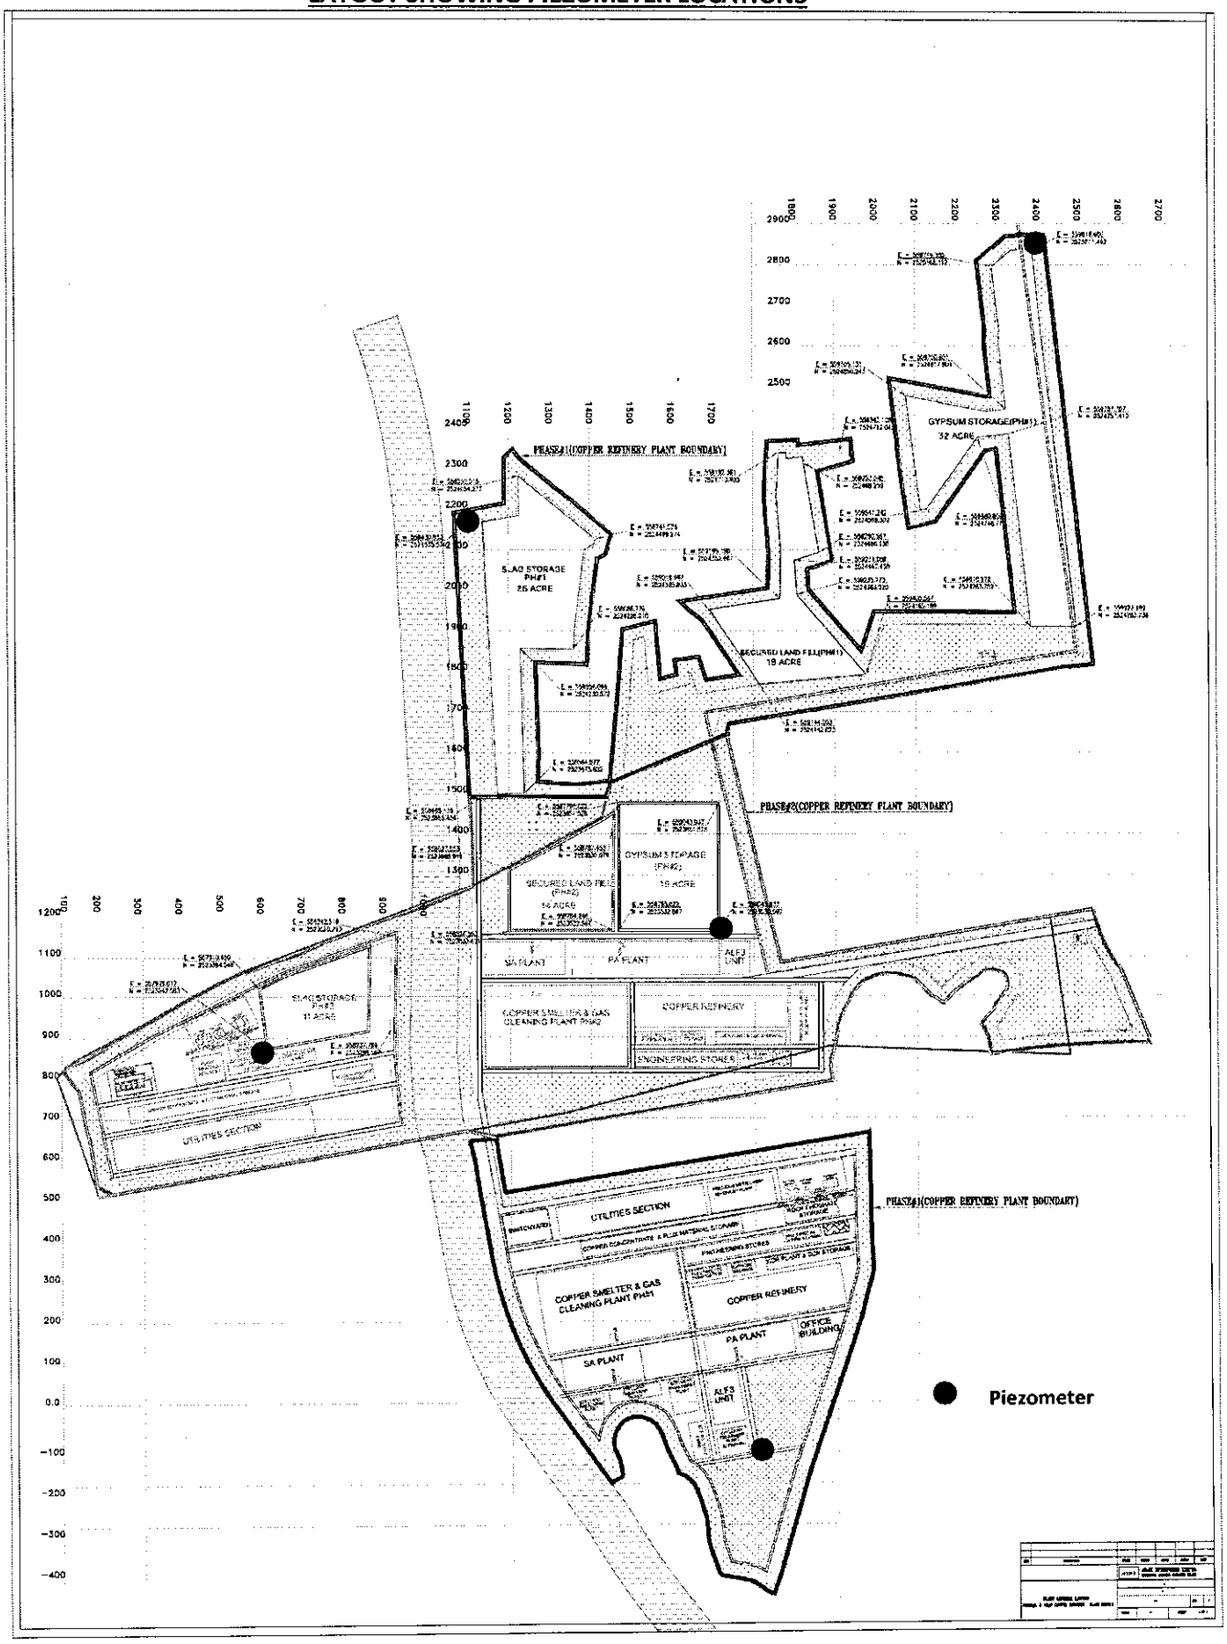
2.10 Annexure

Liner Make: Naue, Germany, Thickness: 1.5 mm-Smooth

Length:150m, Width:7,5m



Property	Test Method	Unit	Value
Thickness Nominal	EN-1849-(2)/ASTM D 5199	mm	1.50

LAYOUT SHOWING PIEZOMETER LOCATIONS

EAC OBSERVATION NO.-11

3370

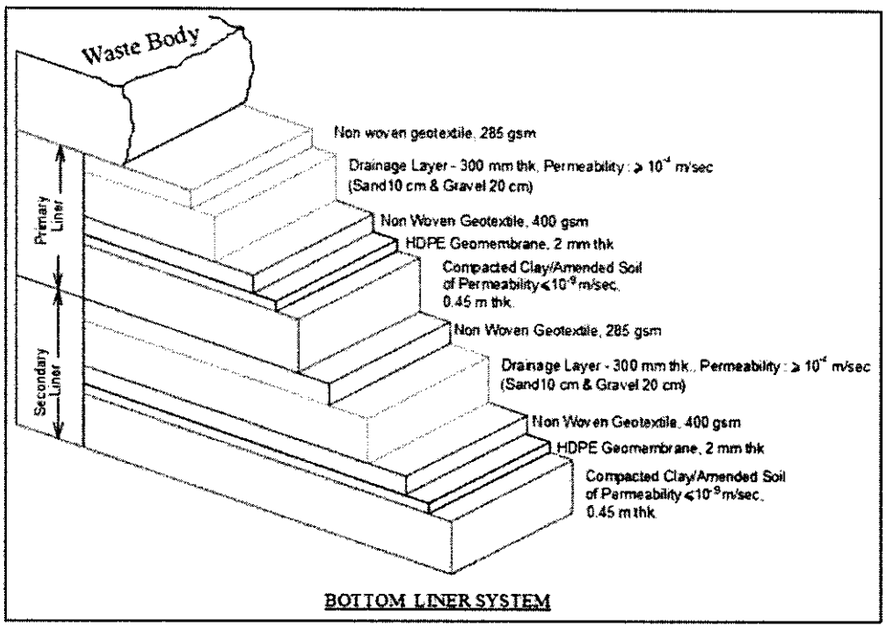
EAC OBSERVATION:

Secured land fill site co-ordinates, lining details, leachate collection system envisaged and details of piezo-well installation has not been made available.

REPLY:

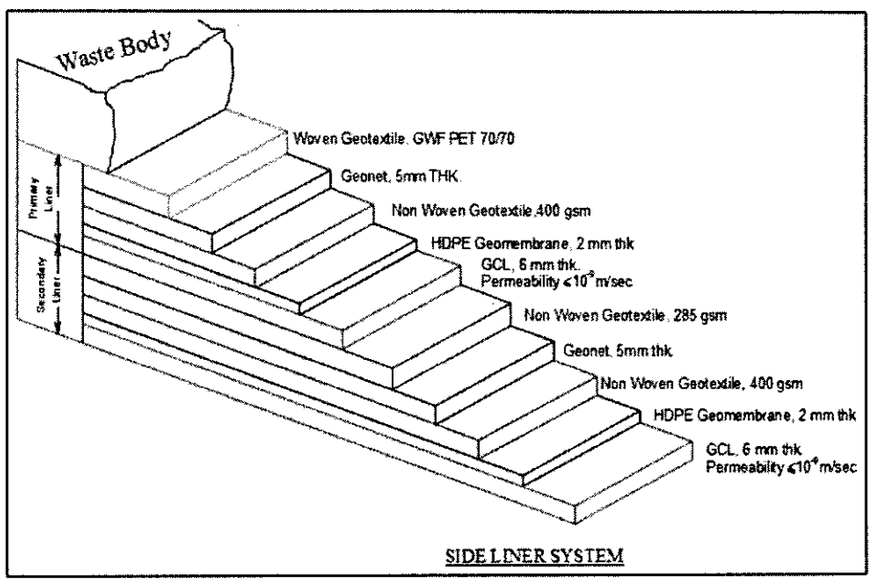
Site Coordinates are marked in Plot Plan and attached in annexure **Annexure-11(a)**

Secured land fill will be developed strictly as per CPCB Guidelines for Criteria for Hazardous Waste Landfills series: HAZWAMS/17/2000-01.



CRITERIA FOR SITE SELECTION FOR STORAGE OF HAZARDOUS WASTE (AS PER CPCB GUIDELINES)

Sr. No.	Description	Locational Criteria	Compliance
1	Lake or Pond	Distance more than 200 m	Storage-I: 550 m from pond located on North West side Storage-II: 850 m from pond located on North Side
2	River	Distance more than 100 m	Storage-I: 640 m from river flowing on West side Storage-II: 50 m from river flowing on West side
3	Flood Plan	No construction 100 Year flood Plan	Since no flow data is available for Dhanesrwari Nadi, a tentative estimate of run-off from Dhanesrwari Nadi catchment and discharge at railway line near project site is done based on the catchment characteristics.
4	Highway	Distance more than 500 m	Storage-I: 850 m from SH-6 which is on North side Storage-II: 1900 m from SH-6 which is on North side
5	Habitation	Distance more than 500 m	Storage-I: 1800 m towards North Storage-II: 2400 m towards North
6	Public Parks	Distance more than 500 m	Storage-I: 1850 m towards North Storage-II: 2450 m towards North
7	Critical Habitat Area	Nothing within critical Habitat areas including reserved forest area	NA
8	Wetlands	No construction within wetlands	Storage-I: 2.5 km from mangrove near Kotri creek Storage-II: 2.0 km from mangrove near Kotri creek
9	Airports	No construction within zone around airports as notified by regulatory authority or aviation authority	Bhuj Airport: 50 km Mundra Airport: 30 km
10	Water Supply Well	Distance more than 500 m	1.7 km from well in Navinal
11	Coastal Regulation Zone	No construction in Coastal Regulatory Zone	Storage-I: 750 m from CRZ Line Storage-II: 600 m from CRZ Line
12	Ground Water Table Level	No construction where ground water table will be less than 2 m below the base of the landfill	<2 m to 10 m



M/s. Garware Technical Fibres Limited (Geosynthetics Division), Pune; has been engaged to carry out a detailed technical study for the construction of the secured land fill and same is attached as **Annexure-11(b).**

The thickness of the HDPE liner shall be 2.0 mm thick (min) with minimum width of 7.5 m and length of 120 m to reduce the number of joints. Understanding the seriousness of the project Naue– Germany/ Equivalent– GSE Germany make shall be used. HDPE liner make will be laid at the prepared base areas as well as on the dike slopes. A detailed technical specification has been provided as a part of the technical proposal attached. Leachate collection system shall be installed and leachate will be treated into effluent treatment plant. A 60 m^3 leachate collection sump for each SLF will be provided along with pumping system to transfer to ETP for treatment and consumption.

Piezo well shall be installed based on the hydrogeology study carried out and location of the Piezo wells have been marked on the plot plan and same is attached as **Annexure-11(a).**

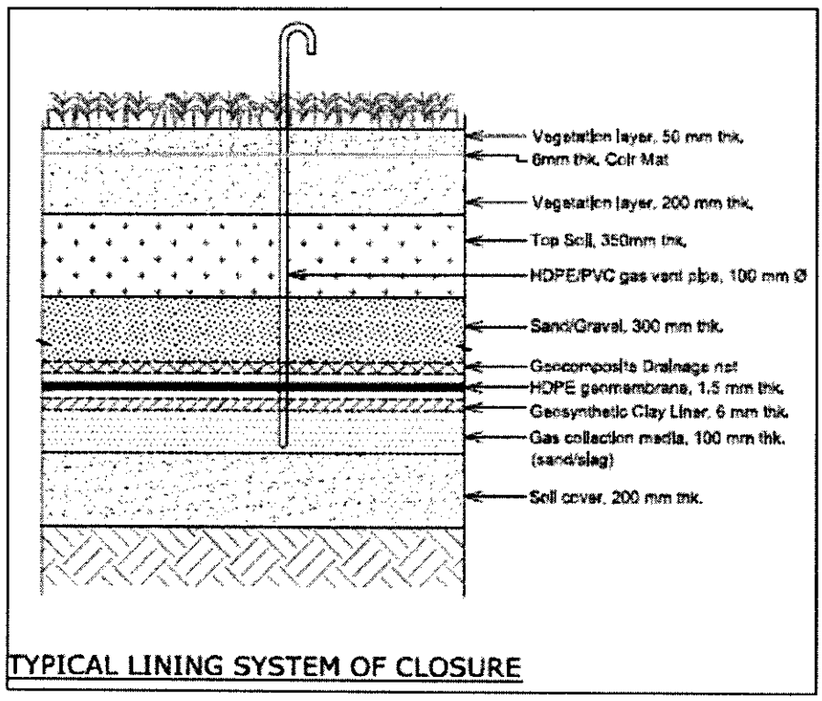
SECURED LAND FILL LINER SYSTEM (BOTTOM LINER)

SECURED LAND FILL LINER SYSTEM (SIDE LINER)

3372

EAC OBSERVATION NO.-11

It comprises of the following:



- **Geo-membranes:**
  - Material: HDPE
  - Thickness: 2.0 mm thick (min)
  - Process: Flat cast extrusion
  - Make: Naue – Germany / Equivalent -GSE-Germany.
  - Width/Length: 7.5 m/ 150 m

- **Protection Layer (Non-Woven geotextile)**
  - Material: 100% UV stabilized Polypropylene continuous fibers/filaments
  - Thickness: 400 gsm
  - Width/ Length: 4 m/ 90 m

- **Separation Layer (Non-Woven geotextile)**
  - Material: 100% UV stabilized Polypropylene continuous fibers/filaments
  - Thickness: 285 gsm
  - Width/ Length: 4 m/ 125 m

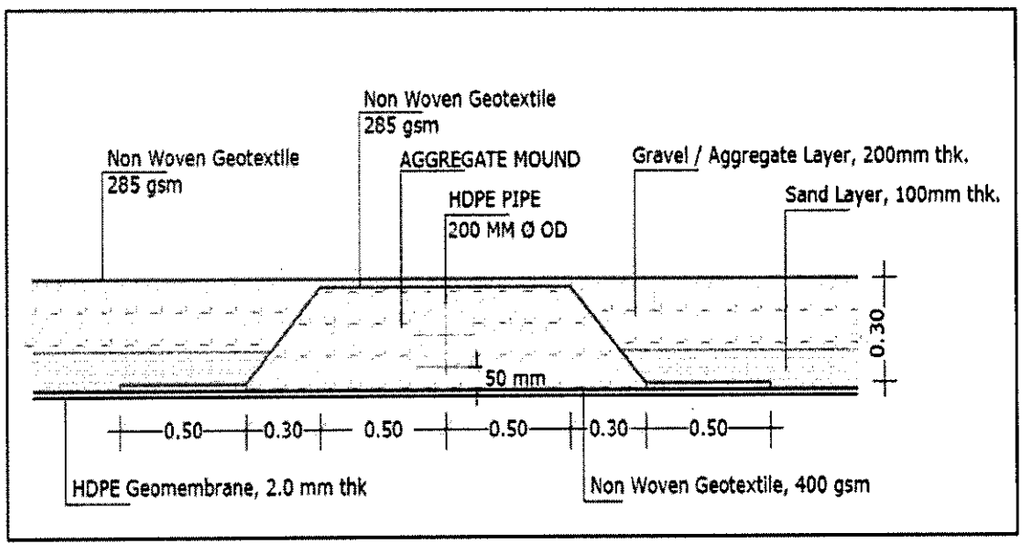
- **Drainage Layer**

Drainage layer of 30 cm granular material comprising of 10 cm coarse sand and 20 cm of gravel & having permeability>1*10-2 cm/sec will be laid over the protective layer of Geotextiles.

TYPICAL LINING SYSTEM OF CLOSURE

SECURED LAND FILL LINER SYSTEM (TOP LINER)

After the completion of each phase of the operation, the landfill will to be closed /insulated by putting the final cover.



The final cover helps for the following:

- It enhances surface drainage
- Minimizes infiltration
- Vegetation grows on it

Construction of the Final Cover System:

Over the waste body

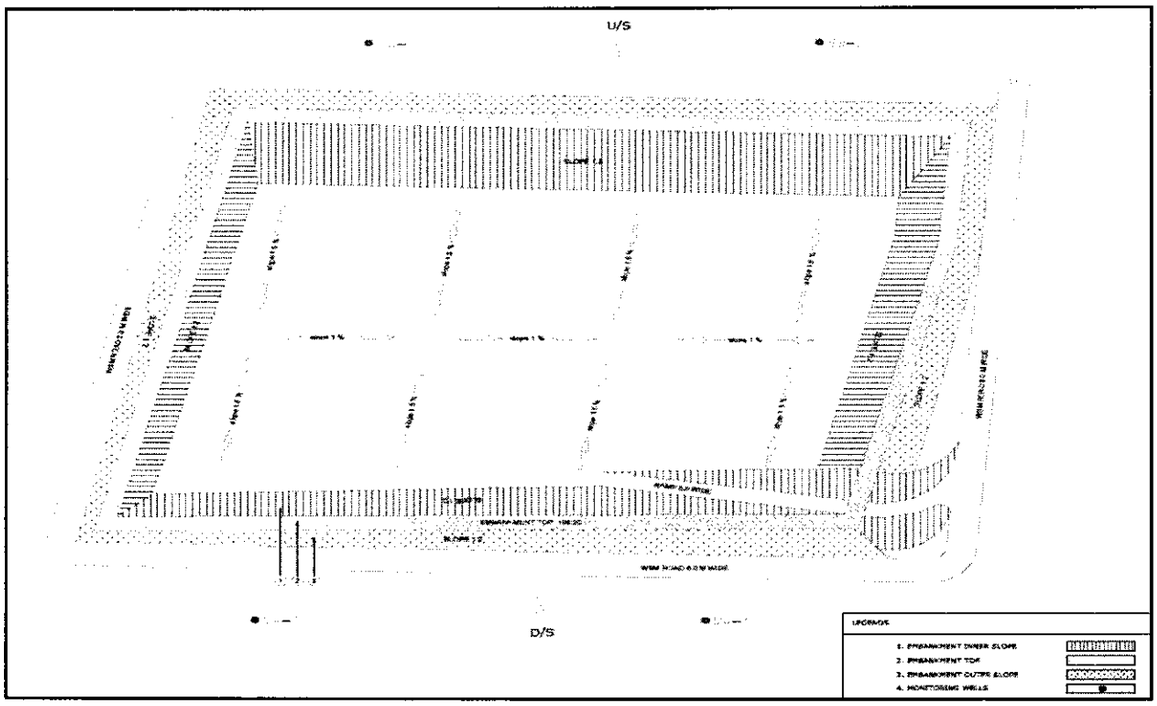
- Soil cover of 150 mm thick
- Gas collection media of 100 mm thick.
- Geo-synthetic cay liner (GCL of 6 to 7 mm thick) over the Gas collection media.
- Beyond this compacted clay/GCL, HDPE of 1.5 mm is will be laid.
- Over the HDPE, a drainage layer of Geo-composite drainage net will be laid.
- The final top soil layer of 600 mm thick (450 mm soil+150 mm Vegetative soil) will to be put for restricting the soil erosion from the final cover.

LEACHATE DRAINAGE, COLLECTION AND REMOVAL SYSTEM:

It comprises of the following:

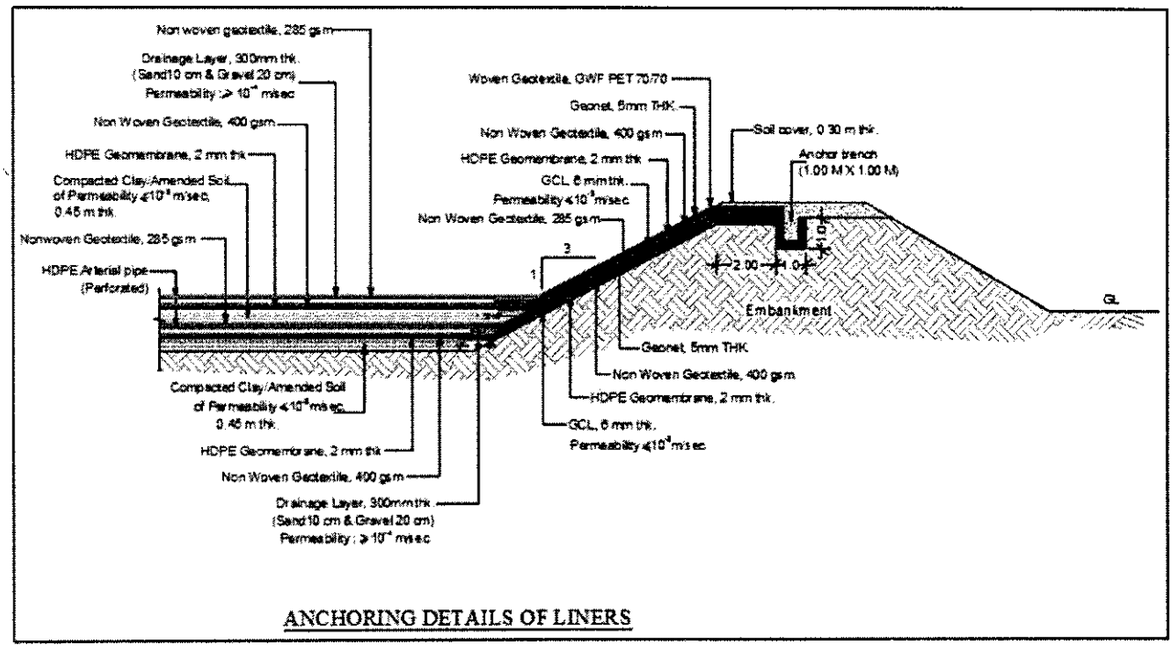
- Drainage Layer.
- A Perforated Pipe Collector System.
- Sump Collection Area.
- Removal of the leachate.

The leachate drainage is achieved using graded under-liner and drains which lead to a collection system or a sump.



3374

EAC OBSERVATION NO.-11



The technical details of the leachate drainage are as under:

- Thickness of the Drainage Layer: 150 mm for arterial pipes for collecting and 200 mm main header line for transporting the leachate from the body of SLF
- Material: Gravel/Sand for secondary bottom liner and geonet for primary bottom liner, primary and secondary side liner
- Permeability: 0.01 cm/sec

Natural slope shall be preferred for the transport of the generated leachate which will be collected in the channel and conveyed to the sump via collector pipe due to the designed longitudinal slope by gravity.

1 Cover Note

With reference to the subject cited above, it give us pleasure to receive the enquiry and would like to place on record our desire to associate in the subject project for the Design and Development of Secure Landfill Facility as per the CPCB guidelines. Sir, we at Garware Technical Fibres Ltd (GTFL)-Geosynthetics Divn have been striving tirelessly to Design, supply, install and commission the best Environmental protection Structures for the Waste/Process residue management for the industries as well as municipal corporations. We are also working in many diverse areas of Ground/Geotechnical/Geo-environmental engineering with prime focus on environmental protection, resource Conservation. In specific to the complexity of the project which Adani Enterprises Ltd is planning to undertake, we would like to put forth the following points:

GTFL has been involved in design, engineering and execution of large number of Secure Landfill Facility –Design & Development Projects as per CPCB Guidelines for its customers including Indian Oil, Sterlite Industries, Cairn Energy, HZL, Vedanta Aluminium Ltd, Pimpri Chinchwad Municipal Corporation, KMML-Kerala to name a few.

We have also knowledge of the legal and statutory requirements of the project of such nature and have been associated with various Pollution Control Boards on behalf of the industry and thereby handling and holding hand in explaining the technicalities and compliance related issues to the regulators and other stakeholders.

Above all, our experience of past **20 years in Geosynthetic Lining and related construction with cutting edge technology** has always given industry the confidence to associate with us.

We would be pleased to associate with you to deliver the best available design, products and services for your project We are also sure that your company will be equally interested to give us an opportunity to demonstrate our Supply/Service capability for the subject project.

2 Brief about Secure Landfill Facility

The following pages gives only brief outline of key elements of the Secure Landfill Facility for explanation purpose which Adani Copper Refinery is proposing to construct at its upcoming Copper Refinery located at Mundra, Gujarat. At a later stage, detailed engineering, planning including drawing, material specifications shall be made and the same shall be submitted for approval before starting of the construction of the facility.

2.1 SLF Layout

The site layout shall be designed with the Secure Landfill Facility's construction, closure and end use closely in mind as this decides the final shape or the contours of the landfill. The Landfill broadly consists of the following in its proposed area:

- Body of the Facility where disposal will take place
- Supporting Infrastructure for smooth functioning of the facility.

The supporting infrastructures will also be decided based on the following:

- Size of the Facility. al
- Volume of waste it is going to handle.
- No. of trips the vehicle will make on daily basis.
- Loading and unloading conditions.
- No. of rainy days.
- Legal Requirements.

The processes taking place in a Secured Landfill Facility can be briefly described as the following. The waste coming into the landfill shall be checked and sent to the landfill facility. This waste when in contact with rain water produces leachate which is collected through leachate collection pipe network to the Leachate collection sump and further sent to Solar evaporation pond by pumping.

2.1.1 Associated Infrastructure

1. Main Entrance and Gate
2. Security cabin/ Administration building
3. Fill Soil Area
4. Storm Water Drain
5. Access Road
6. Ground Water Monitoring Well (Piezo metric Well)
7. Fencing & Greenery
8. Waste Stabilization Area of Hazardous Waste

2.1.2 SLF & its Elements

9. Secured Landfill Facility: for Hazardous and Non Hazardous Waste
10. Approach Ramp
11. Leachate Collection Sump
12. Leak Detection Sump

2.1.3 Site Investigation Criteria

2.1.3.1 Preliminary Boreholes and Geophysical Investigation:

At each site, as a part of preliminary data collection, one to two boreholes will be drilled and samples collected at every 1.5m interval to a depth of 20m below the ground surface. The following information will be obtained:

(a) soil type and stratification;
(b) permeability of each strata;
(c) strength and compressibility parameters (optional);
(d) ground water level & quality and depth to bedrock.

In addition to preliminary boreholes, geophysical investigations (electrical resistivity/seismic refraction/others) will be undertaken to assess the quality of bedrock at different sites.

A detailed site investigation program will comprise of:

(a) subsoil investigation,
(b) ground water/hydrogeological investigation.
(c) hydrological investigation,
(d) topographical investigation and
(e) geological investigation.

2.1.3.2 The output expected from each investigation is listed below:

I. **Subsoil Investigation:** A detailed investigation plan may be drawn up in consultation with a geotechnical engineer. The output from such an investigation should yield the following:

(a) Stratification of subsoil -type of soil and depth
(b) Depth to ground water table and bedrock (if located within 15m of base of landfill)
(c) Permeability of various strata beneath the landfill.
(d) Strength and compressibility properties of subsoil
(e) Extent of availability of liner material, drainage material, top soil and protective soil in adjacent borrow areas.
(f) Subsoil properties along approach road.

A minimum of 3 boreholes per hectare of landfill area upto 15m beneath the base of the landfill shall be drilled and in-situ tests as well as laboratory tests shall be performed for permeability, strength, compressibility and classification of soils.
In addition, test pits and boreholes shall be drilled at borrow area for liner and cover materials as well as along approach road.

II. **Ground Water/ Hydrogeological Investigation:** A detailed investigation plan may be drawn up in consultation with a ground water specialist or a hydrogeologist. The output from such an investigation should yield the following:

(a) Depth to groundwater table and its seasonal variations.
(b) Ground water flow direction
(c) Baseline ground water quality parameters -all drinking water quality parameters.

III. **Topographical Investigation:** Construction of a landfill involves a large quantity of earthwork. It is essential to have an accurate topographical map of the landfill site to compute earthwork quantities precisely. A map of 0.3m contour interval is considered desirable.

IV. **Hydrological Investigation**: The objective of a hydrological investigation is to estimate the quantity of surface runoff that may be generated within the landfill to enable appropriate design of drainage facilities. If additional run off from areas external to the landfill is likely to enter the landfill, this quantity should also be estimated to design interception ditches and diversion channels. Such an investigation shall yield estimates of peak flows if seasonal rivers or streams run close to the site hydrological investigation should indicate the possibility of flooding of the site under one in 100 year flood flows. Surface water samples for water quality analysis may be collected from during hydrological studies.

V. **Geological Investigation and Seismic Investigation:** Geological investigations shall delineate the bedrock profile beneath the landfill base, if not confirmed by subsoil investigations. Geophysical surveys may be designed in consultation with a geologist. In hilly areas or in quarried rocks. Geological investigations should indicate the quality of surficial rock, depth to sound rock and the possibility of interconnected aquifers beneath the landfill base In the rock mass. Detailed seismic data may be obtained as a part of geological investigations.

2.1.3.3 Base Stability, Slope Stability and Seismic Aspects:

For landfills construction on the soil, the base will be checked for stability against bearing failure or excessive settlements.

The stability of side slopes of a landfill shall be checked for the following cases (Fig. 9).

(a) stability of excavated slopes
(b) stability of liner system along excavated slopes
(c) stability of temporary waste slopes constructed to their full height (usually at the end of a phase)
(d) stability of slopes of above-ground portion of completed landfills
(e) stability of cover systems in above ground landfills.

The stability analysis shall be conducted using the following soil mechanics methods depending upon the shape of the failure surface.

(a) failure surface parallel to slope;
(b) wedge method of analysis;
(c) method of slices for circular failure surface and
(d) special methods for stability of anchored geomembranes along slopes.

In preliminary design of a landfill section, the following slopes will be adopted.

(a) Excavated soil slopes(2.5 horizontal : 1 vertical)
(b) Temporary waste slopes(3.0 hOrizontal : 1 vertical)
(c) Final cover slopes(4.0 horizontal : 1 vertical)

Slopes can be made steeper, if found stable by stability analysis results. Acceptable factors of safety may be taken as 1.3 for temporary slopes and 1.5 for permanent slopes.

In earthquake prone areas, the stability of all landfill slopes shall be conducted taking into account seismic coefficients as recommended by BIS codes.

2.2 Basic Design of Secured Landfill Elements

2.2.1 Bottom Liner System

The lining system is additional to the separation or unsaturated zone comprising soil or sand between the wet season high elevation of the ground water and the Landfill. These liner consist of native clayey soil/amended soil/ad-mixture soil. The permeability of the soil / amended soil should be less than or equal to 1×10-7 cm/sec.

A schematic cross section of the bottom Liner system is given in **Figure 1.**

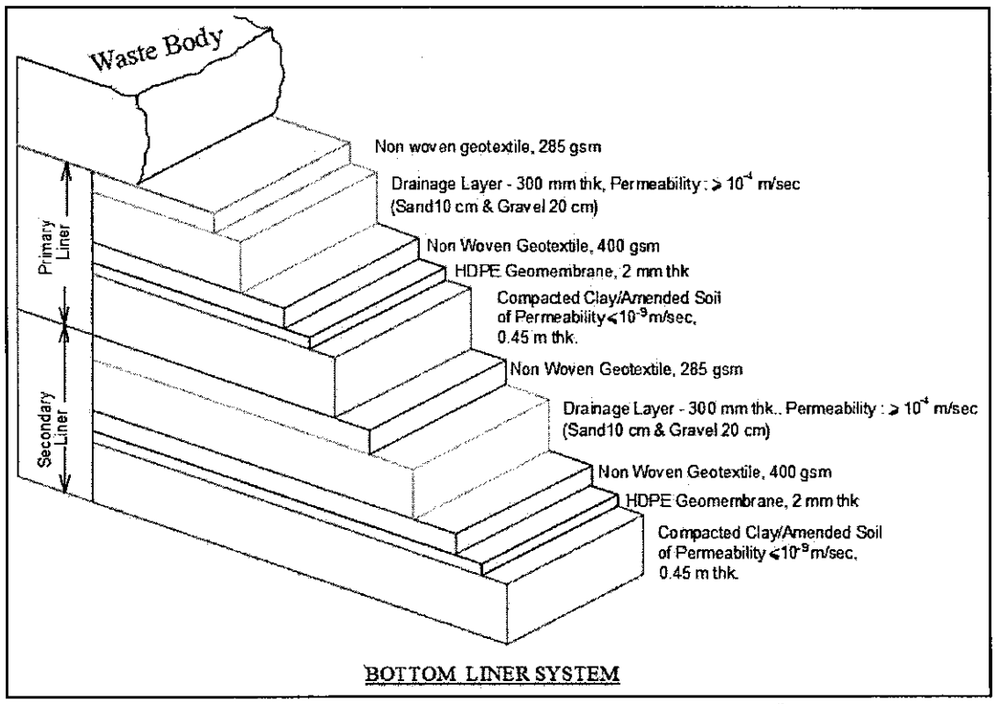

Figure 1: Bottom Liner System (Hazardous Waste Landfill)

2.2.1.1 Geomembranes

These are flexible sheets made from various plastic materials. The recommended liner along the side as well as the bottom of the facility is HDPE Liner. HDPE lining is effected by overlapping the strips and joining them with a special welding technique.

The thickness of the HDPE liner shall be 2.0 mm thick (min) made through flat cast extrusion technology to keep the thickness variation across the rolls to less than 5% and the minimum width of the membrane shall not be less than 7.5 m and length shall not be less than 150 m to reduce the number of joints. Understanding the seriousness of the project Naue –Germany / Equivalent -GSE-Germany make has been recommended for use. Detailed Material Specifications are given in the annexure.. Equivalent product's details must be shown to the Technical Engineer for review of its properties/performance.

2.2.1.2 Protection Layer (Non Woven geotextile)

To protect the geo membrane against the mechanical stress and failure thereby, non-woven needle punched Geo textile manufactured through mechanically bonding and made from continuous fibres/filaments and made of 100% UV stabilized Polypropylene is to be used on the HDPE Liner on the bed as well as the slopes. For the protection purpose, 400 gsm overlay Non-Woven Geotextile has been recommended. Equivalent product's details must be shown to the Technical Engineer for

review of its properties/performance. The minimum width of the Non Woven Geotextile shal be 4 m and minimum length shall be 90.0m.

2.2.1.3 Separation Layer (Non Woven geotextile)

After the construction of the primary lining system, separation textile of 285 gsm to be laid over the drainage layer before the waste laying is done. The minimum width of the Non Woven Geotextile shall be 4 m and minimum length shall be 125.0 m.

2.2.1.4 Drainage Layer

The landfill facility essentially generates significant quantity of leachate due to inherent moisture present in the waste body and the rain water precipitation. This leachate is impregnated with harmful chemicals and pollutants. This is to be collected, removed from the facility and treated. In order to collect the leachate from the waste body a Drainage layer of 30 cm granular material comprising of 10 cm coarse sand and 20 cm of gravel & having permeability>$1*10^{-2}$ cm/sec is to be laid over the protective layer of Geotextiles.

Looking at the following aspects of the landfill the following drainage medium has been recommended:

i. Structural profile and geometry

ii. Bottom and side slope pattern

iii. Performance of various geological and synthetic material for drainage function

Hence for the side slope geonet manufactured from Polyethylene and of minimum width of 4.0m to be used and for the bottom slopes, Sand/gravel as a drainage medium for the primary and secondary layer of desired specification has been recommended.

2.2.2 Side liner system of Secured Landfill Facility

The side liner system is on the inner side of soil bunds with slope 1:3 (V: H).The construction procedure of each layer of sideliner system is shown in **Figure 2**Figure 1.

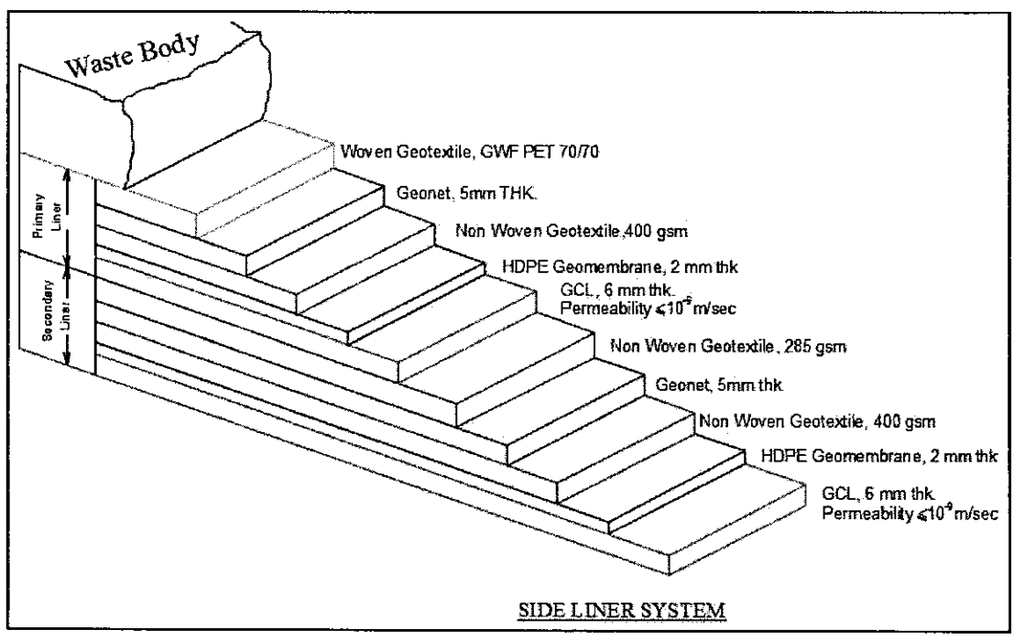

Figure 2: Side Liner system for Hazardous Waste Landfill

GCL-manufactured through use of powdered bentonite sandwitched between two layer of geotextiles and needle punched to keep the bentonite in place such as Bentofix-Naue Germany

make/equivalent of minimum 6-7mm thickness to be used instead of compacted clay as the slope is not so gentle and it is difficult to compact the clay on steep slope. Minimum width of the GCL shall be 5.0m and minimum length shall be 40.0m. Equivalent product's details must be shown to the Technical Engineer for review of its properties/performance.

2.2.3 Top Liner System

After the completion of each phase of the operation, the landfill has to be closed /insulated by putting the final cover. The final cover has the following advantages:

(a) It enhances surface drainage
(b) Minimizes infiltration
(c) Vegetation grows on it

The following Final Cover System is recommended. Over the waste body a soil cover of 150mm thick and a Gas collection media of 100mm thick is proposed. Geosynthetic Clay Liner (GCL of 6 to 7 mm thick) has to be laid over the Gas collection media. Beyond this compacted clay/GCL, HDPE of 1.5 mm is to be laid. Over the HDPE, a drainage layer of Geocomposite drainage net shall be laid. And the final top soil layer of 600 mm thick (450mm soil+150mm Vegetative soil) has to be put for restricting the soil erosion from the final cover.

A cross section of the top liner system is given below in **Figure 3**.

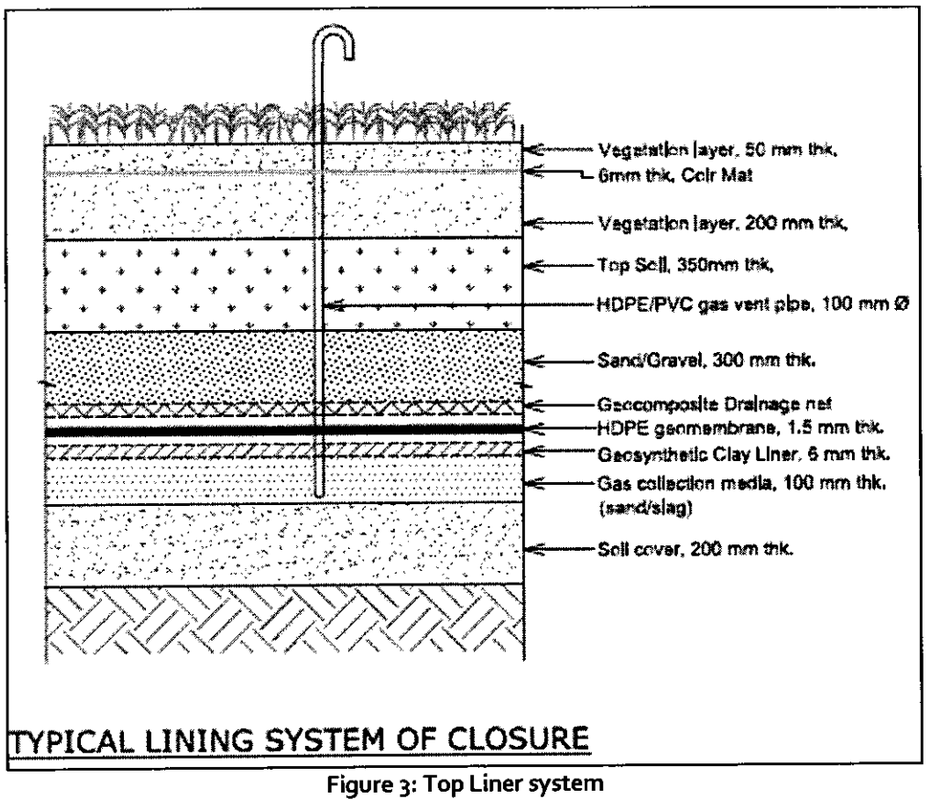

Figure 3: Top Liner system

2.2.4 Leachate Drainage, Collection & Removal System

In order to collect and convey the leachate generated to the collection sump, a Leachate collection System has been designed. It comprises of the following:

(a) Drainage Layer.
(b) A Perforated Pipe Collector System.
(c) Sump Collection Area.

(d) Removal of the leachate.

The leachate drainage is usually achieved using graded under-liner and drains which lead to a collection system or a sump. The technical details of the leachate drainage are as under:

(a) Thickness of the Drainage Layer: 150 mm for arterial pipes for collecting and 200 mm main header line for transporting the leachate from the body of SLF
(b) Material: Gravel/Sand for secondary bottom liner and geonet for primary bottom liner, primary and secondary side liner
(c) Permeability: 0.01 cm/sec

Natural slope shall be preferred for the transport of the generated leachate which will be collected in the channel and conveyed to the sump via collector pipe due to the designed longitudinal slope by gravity. A typical plan is shown in **Figure 4**:

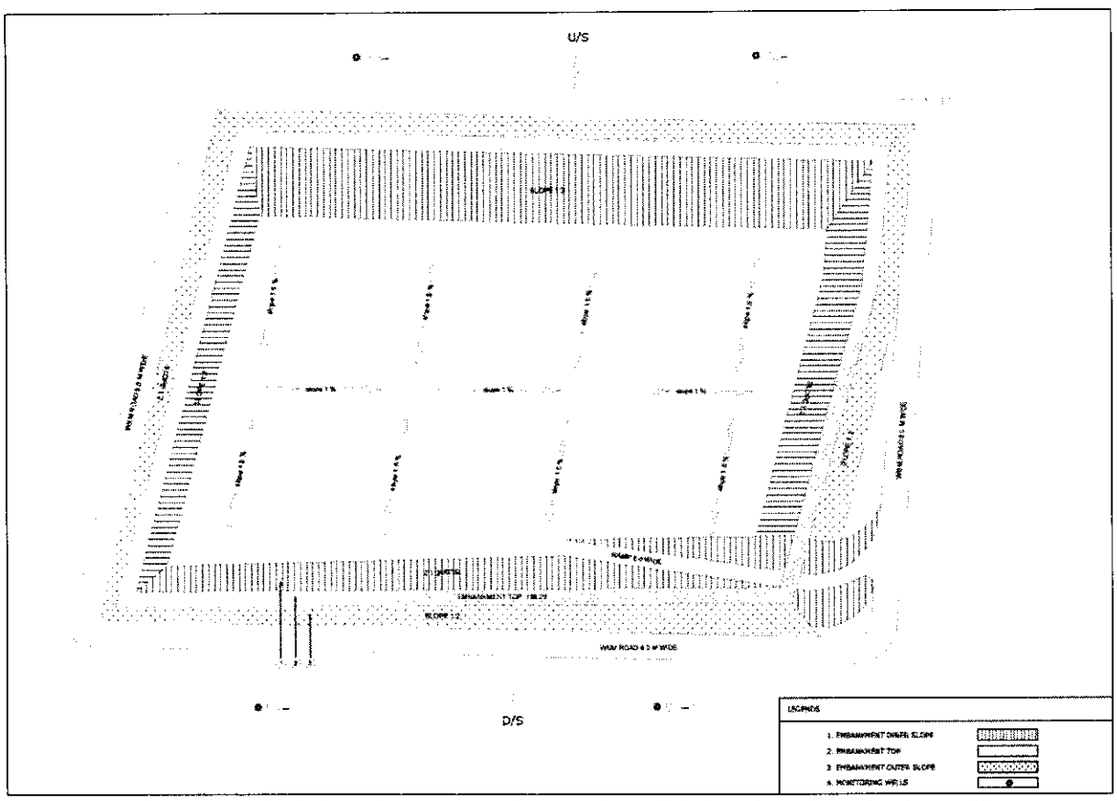

Figure 4: Typical Plan of SLF, Drain Slope and possible location of Monitoring well

The sectional plan for leachate conveyance system comprises of the following:

(a) Central Leachate carrying pipe in conjunction with the drainage layer
(b) Estimation of pipe diameter based on the leachate quantity
(c) Design of slope of Leachate Pipe

A schematic drawing of leachate conveyance is shown in **Figure 5** for reference purposes.

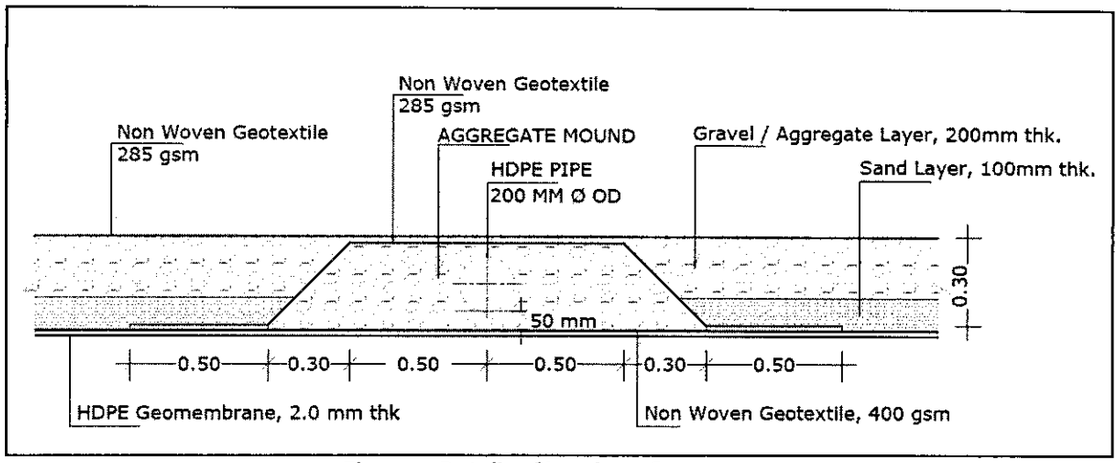

Figure 5: Details of Leachate Conveyance

A typical sectional view of the Landfill lining and anchoring system along with piping is shown below:

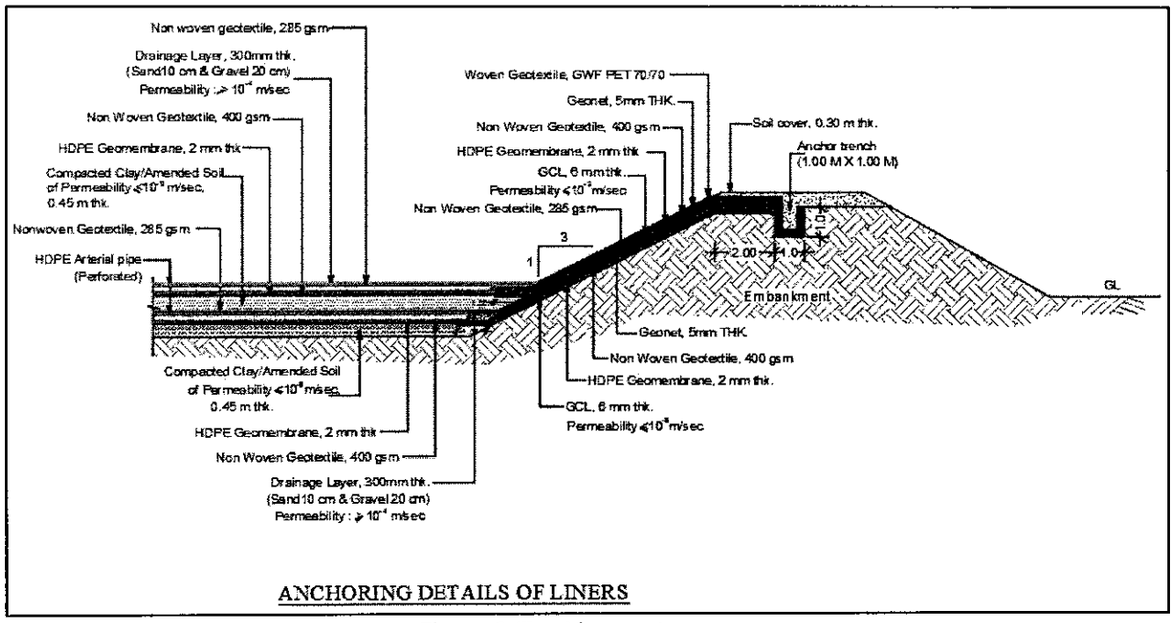

Figure 6: Top Liner system

2.2.5 Surface Water Drainage System

Surface water management shall be designed to ensure that rainwater run-off does not drain into the waste from surrounding areas and that there is no waterlogging/ponding on covers of landfills. A schematic surface water drainage system comprising of channels, drains, culverts and basins (Fig8) shall be designed to ensure the following:

(a) Rainwater running off slopes above and outside the landfill area shall be intercepted and channelled to water courses without entering the operational area of the site. This diversion channel may require a low permeability lining to prevent leakage into the landfill

(b) Rain falling on active tipping areas shall be collected separately and managed as leachate, via the leachate collection drain and leachate collection sumps to the leachate treatment and disposal system.

(c) Rainfall on areas within the landfill site, but on final covers of phases which have been completed and are not actively being used for waste disposal shall be diverted in drainage channels away from active tipping areas, and directed through a settling pond to remove suspended silt, prior to discharge.

(d) Any drainage channels or drains constructed on the restored landfill surface shall be able to accommodate settlement, resist erosion and cope with localised storm conditions.
(e) The horizontal surface of the final cover shall be provided a slope of 3 to 5% for proper surface water drainage. The slope of the cover on the sides will be higher and governed by slope stability considerations
(f) All Interceptor channels, drainage channels and settling ponds (storm water basins) shall be designed by a hydrologist using hydrometerological data.
(g) It shall be ensured that water collected by surface water drainage system and leachate collected by the leachate collection system do not get intermixed at any stage of collection or storage This shall apply to the 'active' and 'post closure' periods of the landfill

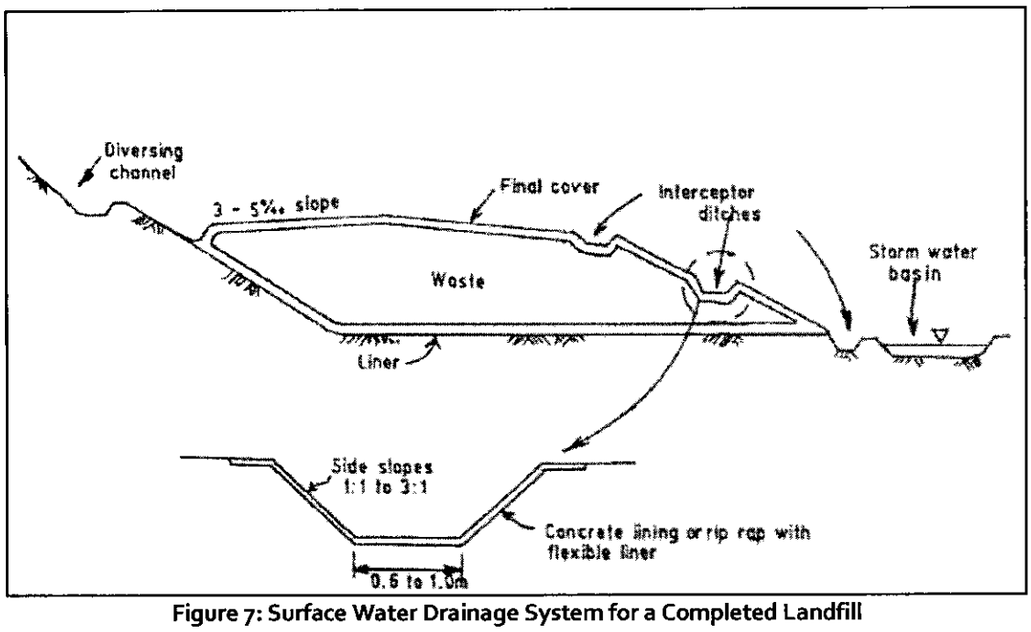

Figure 7: Surface Water Drainage System for a Completed Landfill

The design of following components will be undertaken:

(a) storm water drains, diversion channel
(b) storm water basin
(c) culverts if required

2.2.6 Construction of Embankment

Embankment shall be designed based on sound engineering practices and also shall be checked for slope stability analysis considering seismic factors of Mundra-Gujarat region.

The embankment shall be constructed to the lines and grades shown on the drawings. Placement of fill shall be performed in an orderly way and in an efficient and workman like manner, so as to produce fills having such quantities of density, strength and permeability as will ensure the highest practicable degree of stability and performance of the embankment.

The slopes of embankment shall be maintained as per specific structures drawing.

2.2.6.1 Fill Materials

The materials for embankment shall be obtained from the available excavated material. Some earth material available from the excavation in the pond area if found suitable will also be used for the embankment construction. Morrum / Yellow soil or soil which satisfy the accepted civil engineering property of the bund construction shall be accepted.

2.2.6.2 Placing the fill material, Compaction of the Embankment and Base: (IS: 2720)

The combined excavation and placing operations shall be such that the materials when compacted in the fill will be blended sufficiently to produce the specified degree of compaction and stability. The earth obtained from a particular borrow area as far as possible shall be used in forming the complete cross-section of the fill for a particular stretch.
No stones cobbles or rock fragments, having maximum dimensions of more than 5 cm shall be placed in the fill. Such stones and cobbles shall be removed either at the borrow pit or after being transported to the site but before the materials in the fill are rolled and compacted. Such stones or cobbles shall be placed in other portions of embankment if found suitable or rejected as directed. The materials shall be placed in the fill in continuous horizontal layers, stretching right across the whole section, not more than 0.4 m in compacted thickness.

Vibratory rollers/static roller shall be used for compacting cohesive materials and pneumatic rollers and vibratory rollers shall be used for compacting cohesion less materials. The compaction in horizontal layers will be done using standard compaction equipment or in inclined layers using slope compactors/appropriate method.

2.2.6.3 Inspection Test

Control tests shall be carried out in laboratory from time to time to determine whether the earth produced by methods employed satisfies the requirements of the specifications and documented for verification by the Officer- in –Charge of the regulatory authority and the work shall be inspected periodically.

Complete documentation of all quality control records and their submission to the GPPCB along with showing satisfactory achievement of acceptance criteria.

The quality control tests for compacted clay layer (or amended soils) as well as the leachate collection/drainage layer will include

(a) In-situ density tests.
(b) in-situ moisture content tests.
(c) Compaction tests.
(d) Permeability tests,
(e) Grain size distribution tests and
(f) Atterberg's limits tests
(g) Others as defined by GPCB.

The quality control tests for geomembrane liners shall be carried at as per QA/QC protocol and shall include the following:

(a) Thickness tests,
(b) Density tests,
(c) Strength tests,
(d) Field seam strength & leak tests

Dressing and Trimming of the slopes

The outer slopes of the embankment shall be neatly dressed to line. Compaction shall extend over the full width of the embankment and the material in the slopes shall be compacted as for the rest of structure. To ensure proper compaction at the outer edge, the fill shall be constructed for a minimum of 0.5 m/1.0m extra width on either edges or the outer edge dressed to true width and slope after compaction. No earth slope shall be left without trimming to design slope.

2.2.7 Design of Storm Water Drain

The catchment includes the top or cap of the landfill facility as well as the outer slope of embankment and site upto fencing. Hence to divert the incoming water at the surface level as well as the slope and

terraces of the landfill facility, adequate storm water drainage channels need to be designed, constructed. The channel has to ultimately carry water to the storm water pond for storage or evapoqration purpose in case not discharged outside.

2.3 Piezometric Well

Piezometer shall be constructed to monitor the quality of groundwater. Two piezometers shall be installed on the downstream side of the SLF. Two piezometers shall be installed on the upstream side of the SLF. At present, possible locations have been shown where the installation cane be done. **But, exact location of the monitoring well shall be finalized in consultation with Gujarat State Pollution Control Board.** The piezometer consist of a stand pipe made up of stainless steel/PVC which shall be screened along the entire aquifer depth i.e. the standpipe shall be- screened from a depth of 1 m to 10m or depending on ground water depth. The screened interval shall be encased in a filter zone made up of gravel and sand layer. The function of the filter zone is to allow free flow of groundwater into and out of standpipe and prevent fines from entering the standpipe. Immediately above the screened interval, a clay and bentonite seal shall be placed. The thickness of clay seal shall be 0.5 m. Above the clay and bentonite seal, a grout seal consisting of cement and bentonite shall be constructed which provides a barrier for preventing surface water and ground water from elsewhere from migrating into the screened interval. At the ground level, a steel casing embedded in concrete pad shall be employed. A cap shall be placed on the top of steel casing to prevent rainwater and surface water from entering into the standpipe. The piezometer shall be constructed at a minimum distance of 7 m from outside edge of the embankment. A schematic sketch of a Piezometer is shown in **Figure 8**. The location is shown in figure no 4.

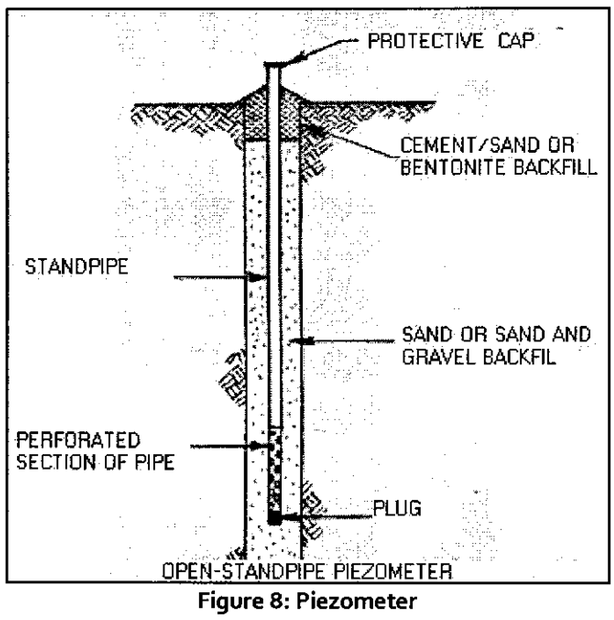

Figure 8: Piezometer

Tolerance: 10% on values except thickness, Carbon Black for which a range is given.

EAC OBSERVATION NO.-12

3392

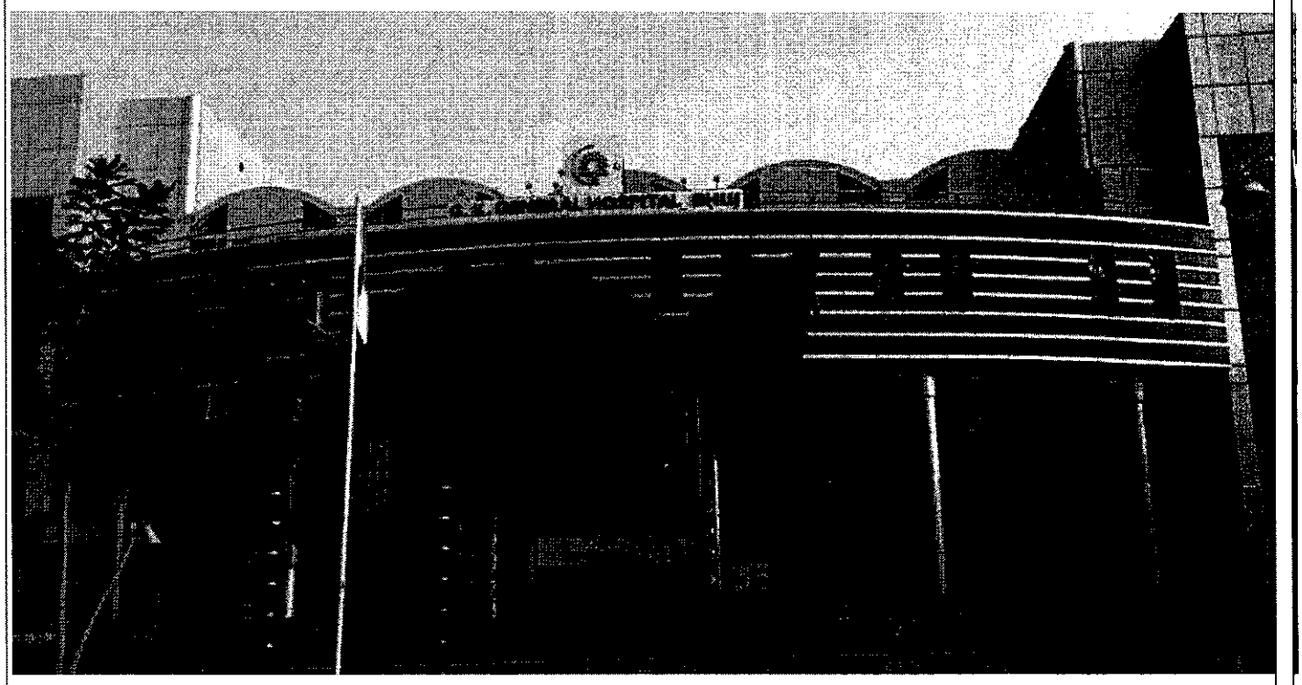
EAC OBSERVATION:

Baseline health status of the people living in the study area of the project site has not been collected.

REPLY:

Baseline Health Status Study within 10 km Radius of the Proposed Copper Refinery Project has been conducted by M/s TALEEM Foundation (A research unit of ZEE Group), Ahmedabad. The study was conducted based on the secondary data available at PHC, CHC, district hospital and relevant secondary report published by Ministry of Health & Welfare, Govt of India.

M/s. TALEEM Foundation, Ahmedabad has engaged **Prof. Dr. A K Sharma, IIT Kanpur** for technical support for preparation health index.



a) The study was conducted based on the data available at PHC, CHC, district hospital and relevant secondary report published by Ministry of Health & Welfare, Govt of India.
b) The community health index has been developed using the statistical method to compare the health performance of project area with the district and state as a whole.
c) Project villages are better than the block average in terms of ANC coverage and live births but lag behind in anaemia among pregnant women and BCG vaccination coverage.
d) Project villages are better than the district in ANC coverage, live births and infants survival but the project villages are not as good as the district in terms of anaemia, TT and BCG.
e) It is observed that Health Index of project villages are 0.81 as compared to block level of 0.75.

A detailed study report is attached as **Annexure-12.**

Study to Establish Community Health Baseline Index within 10 Km Radius of the Proposed Copper Refinery Project in Mundra Taluka of Kutch District (Gujarat)

Preface and Acknowledgement

At the outset, we are grateful to Adani Enterprises Ltd. (AEL) for having entrusted TALEEM Research Foundation, Ahmedabad for the present study aiming to develop health index for the community residing in 16 villages within 10 kilometres radius of a proposed copper refinery project in Mundra taluka of Kutch district.

The study provides an overall health status of 16 project villages in comparison to block average and the district as a whole. This report is largely based on IDSP and HMIS data of six PHCs, two CHCs and District Hospital. Apart from collecting secondary data, health facility survey was conducted to understand the adequacy of health infrastructure and primary healthcare services. The present report is expected to serve as a baseline to measure the impact of the proposed project and various community development initiatives of AEL in future.

We express our sincere gratitude to the team of AEL for their continuous interaction with the core team of TALEEM and extending support and guidance to complete the study on time.

We express our appreciation to Dr Kashyap M Buch, Chief District Medical Officer (CMO) of District Hospital of Kutch district and MIS staff of PHC, CHC and DH for extending their support and cooperation in providing the relevant information for their respective health facilities. We express our sincere thanks to all of them.

We gratefully acknowledge the participation and technical support provided by Professor A.K. Sharma of IIT, Kanpur for developing health index and Dr Sapan Pandya, Medical Consultant for reorienting the survey team on health facility survey tools.

We greatly acknowledge the untiring efforts of TALEEM core team members and support staff for the timely completion of the study.

Md. Irfan Khan, Ph.D. (IIT, Kanpur)

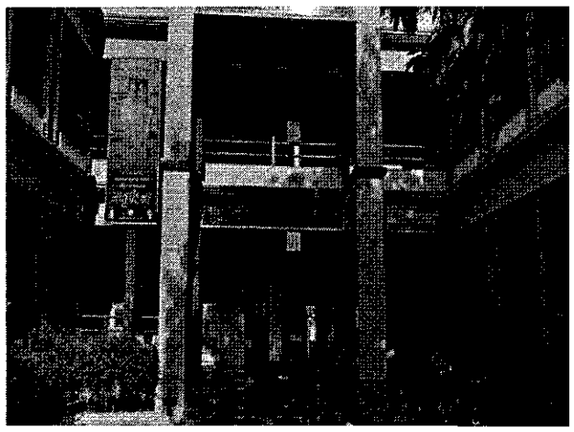
Chapter 1: Introduction

Health, as defined by World Health Organization (WHO), is "a state of complete physical, mental and social well-being and not merely the absence of disease or infirmity." Health is influenced by a number of factors that broadly include genetics, environment, lifestyle, socio-economic conditions and access to health services.

Knowing status of health of community or any area is very crucial for policy decision, planning and need-based-demand-driven programme intervention. Adani group have been pioneers in corporate social responsibility and made significant contributions to improve quality of people's life in the entire region they operate in. Gujarat, APSEZL and AEL have started key initiatives in support of sustainable development aiming at bettering the socio-economic and cultural status of local people.

The present study covering 16 villages within 10 km radius of proposed "*Copper Refinery Project*" at Adani Port Special Economic Zone (APSEZ) intends to generate a health index of the catchment area and to establishing benchmark indicators to measure the impact of various community development initiatives by AEL over a period of time.

Objectives



The broad aim of the present study is to develop community health index of area within 10 km radius of proposed copper refinery project. The specific objectives of study are as under:

1. To establish the Community Health Index of 10 Km. radius area using suitable methodology and input parameters (a. Communicable diseases, b. Non-Communicable diseases, c. Status of facilities available, d. Utilization of health services)
2. Compare the data of BASELINE parameters (Communicable and Non-Communicable diseases) of the study area with data of district and the State as a whole.

3397

3. Mapping of Community Health Resources present in the study area.

Data Collection

PHC Mota Kandagara, Kachchh

In order to establish health index of project areas covering 16 villages (Table 1) catered by six PHCs namely Kandagara Mota, Bhujpur, Jarpara, Nani Tunbadi, Talwanaand Gundiyari and one CHC Mundra where these six PHCs generally refer the patients for specialized health services insub-district hospital (upgraded CHC) of Mandvi and district hospital of Bhuj, Kachchh district were covered.

Table 1: Project Villages

From these facilities, data were collected on existing building infrastructure, human resources (medical, para-medical, lab technicians and support staff), pathology laboratory, surgical and examination equipments, labour room and operation theatre, drugs and drugs kits, medicine dispensing, indoor and outdoor health services. Apart from existing facilities, service statistics for last three years were collected.

Type of Data

Mainly secondary data has been collected from a CHC, PHCs and a District Hospital. In addition, secondary data from Department of Health and Family Welfare, Govt. of Gujarat, Census of India 2011, SRS Bulletin, HMIS for 2017-18 and 2018-19 were collected.

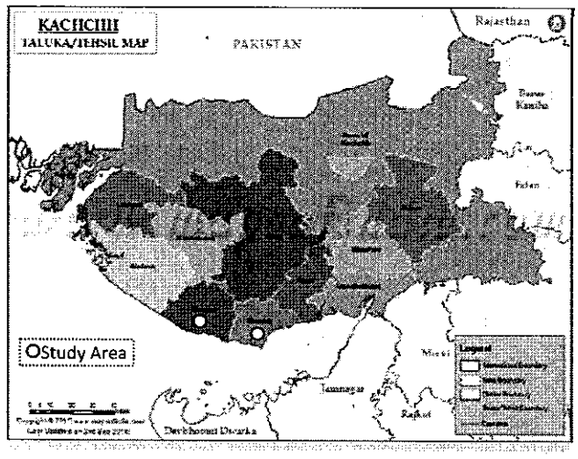
Operational Plan

A very experience research team having experience of developing MIS were pooled from the Foundation's core team who were deputed for data collection from health facilities.

These teams were reoriented one day by the medical doctor who broadly covered all technical aspects of medical infrastructure, equipments, operation theatre and drug dispensing. The data collection was carried out during March 12 to 22, 2019.

Data Analysis and Report Preparation

Brain Storming Session at TALEEM with Adani representative



The Sr. faculty members of the Foundation and Statistician Expert involved in the study have prepared detailed analysis and tabulation plan. The community health index has been developed using the statistical method adopted by WHO considering the list of 47 diseases under classification of communicable and non-communicable diseases to compare the health performance of project area with the district and state as a whole. The same statistical technique was more or less adopted by IIM for developing health index of Indian States.

3399

Chapter 2: Profile of the District and Study *Taluka*(Mandvi and Mundra)

Kachchh is district of Gujarat State in western India covering an area of 45652 sq. km which is 23.3% of the total state geographical areas. It is the largest district in the State of Gujarat and second largest district of India after Leh. It is bounded on the north and north-west by Pakistan, on the north-east by Rajasthan state, on the east by the Banas Kantha and Patan districts of Gujarat, on the south- east by Surendranagar district, on the south by the gulf of Kachchh and Rajkot district and on the south-west by the Arabian sea.

It lies between the parallels of latitude 220.45' to 240 .40' and the meridians of longitude 680.9' to 710 .45.The length from north to south of this territory is about 220.32 km. and from east to west about 376.80 km. The district has the longest coast line of about 406 km. The district has 10 *Talukas* (namely Bhuj, Mandvi, Mundra, Abdasa, Bhachau, Lakhpat, Anjar, Nakhatrana, Rapar and Gandhidham), six Nagar Palika and 949 Revenue villages. Interestingly, there are 19 villages from different sub-districts of Kachchh having population less than 50.

Kachchh district is the 14th most populated district in the State with a total population of 2092371 as per 2011 Census. The district has a population density of 46 inhabitants per sq. kilometer. Its population growth over the decade 2001-2011 was 32.16%. Kachchh has a sex ratio of 908 female for every 1000 males. The distribution of population indicates that Bhuj is the most populous (443269) and Lakhpat is the least populous(62552)*Taluka* of the district. The urban population of

District at a Glance

Area (sq. km)	45652
Population	2092371
Urban Population	34.8%
SC Population	12.37%
ST Population	1.16%
Hindu	76.89%
Muslims	21.14%
Sex Ratio	908
Literacy Rate	70.6%
No. of Taluka	10
Nagar Palika	6
Revenue Villages	949

Source: Census2011

the district accounted for only 34.82 percent of the total population. The district has 76.89% Hindu while Muslims constitute the second largest religious group with 21.14% of the total district population. Similarly, Scheduled Castes (SC) and Scheduled Tribes (ST) constitute 12.37% and 1.16% of the total district population.

The literacy rate of the district as per Census 2011 was 70.6% (with 79.4% for male and 60.9% for female) which is significantly lower than the State average of 78.0%. The rural urban literacy gap is of about 16.0% (64.9% rural and 80.8% urban). The district is ranked 23rd in education in 2011 among all the districts of Gujarat.

The district has a total of 277 SCs, 42 PHCs and 14 CHCs. The number of PHCs providing health services is highest in Bhuj *Taluka* with seven followed by Mundra *Taluka* with sixin number. The highest number of sub-centres (SC) is found to be in Mundra with 52 followed by Bhuj *Taluka* having 44. Anjar *Taluka* has maximum of three CHCs while Bhuj and Mundra *Taluka* have two CHCs in each. The remaining seven *Taluka* has one CHC each.

Taluka	SC	PHC	CHC
1. Lakhpat	27	5	1
2. Rapar	17	2	1
3. Bhachau	19	3	1
4. Anjar	34	5	3
5. Bhuj	44	7	2
6. Nakhtrana	13	4	1
7. Abdasa	34	4	1

9. Mundra	52	6	2
10. Gandhidham	7	1	1
Total	**277**	**42**	**14**

Source: District Human Development Report- 2016

Mandvi and Mundra *Talukas* have about 2.3 and 1.5 lakhs populations respectively. Mandvi constitutes 25.2% urban population as against 13.2% for Mundra. SC population constitutes 13.3% of the total population of each of the two *Talukas.* Sex ratio is more skewed in Mundra (868) as compared to Mandvi with 970 female for every 1000 male. Overall, literacy rate is 75.1% for Mandvi as compared to a little over 77.4% in Mundra. Mundra *Taluka* has relatively more number of SC, PHC and CHC as compared to Mandvi.

Mandvi and Mundra *Talukas* at a glance		
Indicators	Mandvi	Mundra
Population	203373	153219
Urban population	25.2%	13.2%
SC population	13.3%	13.2%
ST population	2.0%	1.3%
Sex ratio	970	868
Literacy rate	75.1	77.4
No. of Sub Centres	30	52
No. of PHC	5	6
No. of CHC	1	2

3401

Chapter 3: Existing Government Health Facilities

As mentioned in Chapter 1, one District Hospital (DH) (Bhuj), two Community Health Centres (CHCs) and six Primary Health Centres (PHCs) have been covered in the study. District hospital is located at district headquarters, i.e. Bhuj and is known as G K General Hospital. Two Community Health Centres one at Mundra and other at Mandvi were included in the study to obtain information on vital statistics. At sector level, six PHCs covering 16 villages around the project sites have been covered for collecting data.

CHC, Mundra, Kachchh

Health Care Delivery System in Gujarat

Before getting into detail of health facilities covered in this study, it is worth while taking a peep into the health care Delivery System in Gujarat. The health care delivery in Gujarat is organized in a three tier system;

i) At the primary level, there are sub health centres and primary health centres (PHCs).

ii) At the intermediate level, there are community health centres (CHCs), taluka hospitals and district hospital. About 3-4 PHCs are affiliated to CHCs. It has been planned to develop CHCs as a first referral units (FRU), because they are scattered all over the state and can provide hospital services at the doorstep of the patient. Almost all CHCs are located in taluka headquarters or other important towns of a taluka. There is at least one operational hospital in each district headquarters

iii) The tertiary or referral level facilities are affiliated to medical college and specialized hospitals. Norms for health facilities are ;

Table 3.1: Population covered under Health Facility for specific Areas

Sr. No.	Health Facility	Areas	Population covered
1	PHC	All Areas	30,000
2	PHC	Tribal, Hilly & Inaccessible areas	20,000
3	Sub-Centre	All Areas	5,000
4	Sub Centre	Tribal, Hilly & Inaccessible areas	3,000
5	CHC	All Areas	100,000

In view of very small number of private practitioner providing health care services, Government sub health centres, primary health centres, community health centres and hospitals are very important in the sense that they provide essential basic health services to the rural as well as urban population. In the entire district of Kachchh 361 government health facilities are functioning. Taluka-wise view of number of health facilities is given in Table 3.2.

Table 3.2: Taluka-wise SCs, PHCs and CHCs in Kachchh district

Sr. No.	Taluka	Sub-Health Centre (SCs)	Primary Health Centres (PHCs)	Community Health Centres (CHCs)
1	Abdasa	34	6	1
2	Anjar	34	7	2
3	Bhachau	19	7	3
4	Bhuj	44	11	3
5	Gandhidham	7	2	0
6	Lakhpat	27	4	1
7	Mandvi	30	8	1
8	Mundra	52	7	2
9	Nakhtrana	13	6	2
10	Rapar	17	9	2
Total		**277**	**67**	**17**

Source: https://gujhealth.gujarat.gov.in/images/pdf/1474-list-18.pdf

As per Table 3.2, there are 277 health sub centres SCs), 67 Primary Health Centres (PHCs) and 17 Community Health Centres (CHCs) in Kachchh district of Gujarat.

Functional Status of Health Facilities

As mentioned earlier, one district hospital (DH) at Bhuj, two (02) CHCs (one each at Mandvi-upgraded into SDH and Mundra) and six (06) PHCs (2 in Mandvi and 4 in Mundra) have been covered under this study. Brief description of infrastructure facility, available at the health facilities covered, has been presented hereunder;

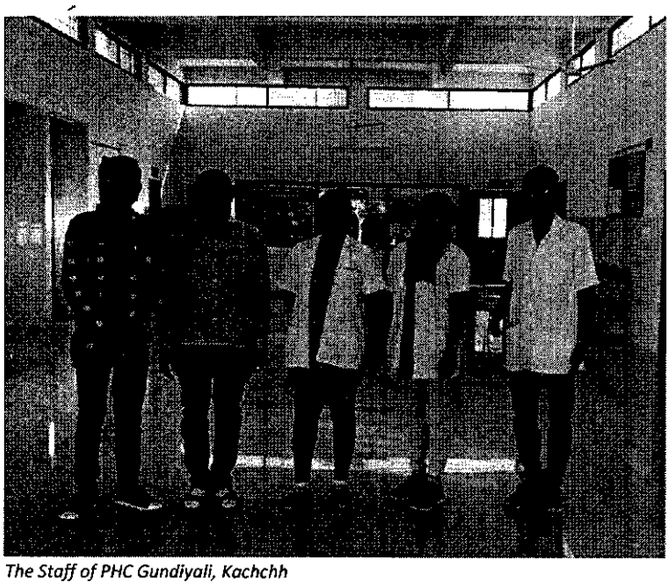
Infrastructure

Seven out of nine health facilities covered, i.e. one (01) district hospital (DH), two (02) community health centres (CHCs) and six (06) primary health centre (PHCs) have own building, PHC at Mota Kandagara and Bhujpur villages do not have own building for PHCs. Two PHCs, i.e. PHC at Zarpara and Bhujpur have borewell/tubewell as main source of water while seven other health facilities including district hospital at Bhuj have piped water as main source of water supply. Water supply is available round the clock in all health facilities covered. Operation theatres and labour rooms in each health facility at taluka level (CHC) and at district level (DH) has regular water supply, however, at sector level, two out of six PHCs, one at Mota Kandagara (no OT or labour room as it is running in a sub-centre) and other at Zarpara villages do not have regular water supply in labour room.

Functional toilet facility with running water is available at all nine health facilities while all but one health facilities (PHC at Kandagara) does not have separate toilet facility for male and female. Three health facilities, i.e. district hospital and two CHCs at Mandvi and Mundra do provide food to in-patients; laundry facility is also available at district hospital and CHC at Mandvi. Outsourced laundry facility is also available at CHC Mundra.

Electricity connection is available in all health facilities and its parts the data indicates while standby facility (generator/inverter) is not available in four out of six PHCs (Table 3.3). Generator backup is assured at all time and is connected to labour room/Ice refrigerator

(ILR)/wards of health facilities where standby facility is available. It has been revealed that adequate funds are available for operating generator/standby facility.



Facilities like Vehicle including Ambulance, Jeep and Car in functional condition, OPD for RTI/STI, name plates/guidelines and counseling is available in all nine health facilities covered at sector, taluka and district level. Barring one PHC at Mota Kandagara village, Eight (08) out of nine (09) health facilities covered have facility available for privacy during examination and separate aseptic labour room. Gynecology /obstetrics OPD facility is available only at CHC and District hospital, not at PHC while telephone facility is available at district hospital, both community health centres and PHCs at Bhujpur and Nani Tumbdi villages.

Staff quarters for RMO and Nurses are available only at Mandvi health facility (CHC/SDH). General medicine ward for male and female separately is available at all health facilities covered. Data also indicates that ANC ward is available in all health facilities covered for obtaining secondary information. Separate registration counters (DH-1, CHCs-2 and PHC-1), complaint/suggestion box, drug storage and drug dispensing (DH-1, CHCs-2 and PHCs-4) and facility for sterilizing instruments (DH-1 and CHCs-2) are available but facility for disposing of bio medical waste is outsourced in all nine health facilities (Table 3.3 – appendix 1).

A view of PHC Gundiyali, Kachchh

3405

The Staff of PHC Gundiyali, Kachchh

Staff Position

As regards staff position, data indicates status of medical and paramedical staff in position in health facilities. Medical superintendent/PMO is in position in all nine health facilities. Barring district hospital, no other health facility has specialist in Medicine and surgery. Obstetrician/gynaecologist, general duty doctor, staff nurse, dresser, lab technician and ophthalmic assistant are available at Mandvi and Mundra CHCs. More number of staff is available in Mandvi CHC (now upgrades as sub district hospital) than Mundra CHC. At Mandvi CHC/SDH one pediatrician, one Pathologist/Microbiologist one ophthalmologist, one dentist, 17 public health Nurses, two technicians, five pharmacists, one physiotherapist are in position. At PHC level, four PHCs have AYUSH physician, two PHCs namely, Zarpara and Bhujpur do not have AYUSH Physician. All PHCs do have at least one pharmacist, medical officer and laboratory technician (Table 3.4– appendix 1).

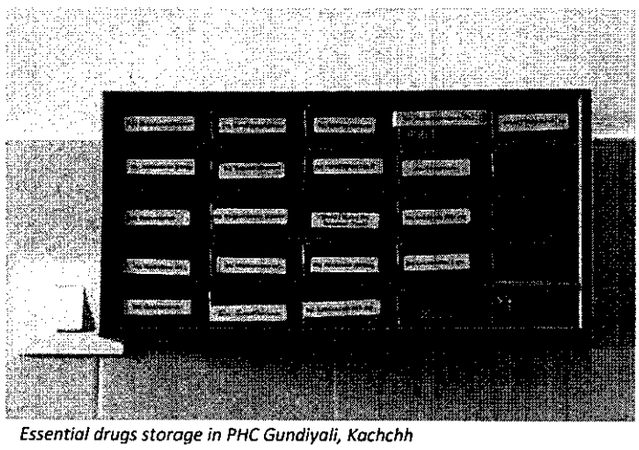
Training Received by Staff

Information on training received by the staff during past five years or ever reveals that no medical staff is trained for RTI/STI, SBA or basic emergency obstetric care, non scalpel vasectomy (NSV) and Mini laprotomy at district hospital whereas at least one medical staff has received training for other major areas mentioned in the Table 3.5. At CHC level, Mandvi CHC/SDH has at least one trained medical staff for new born care, RCH foundation skill, F-IMNCI, SBA/basic emergency obstetric care, integrated management of neonatal and childhood illness (IMNCI), HIV/AIDS prevention, care and support and immunization whereas Mundra CHC has at least one medical person having received training on new born care, RCH foundation skill, F-IMNCI, SBA/basic emergency obstetric care, NSSK (Navjat Shishu Suraksha

Karyakram), vector borne diseases, adolescent reproductive sexual health (ARSH), IUD insertion and immunization.

The laboratory of CHC Mundra, Kachchh

Table 3.5 points out at medical/support staff posted at PHCs having received training on various areas. According to table 3.5, medical officer posted at all six PHCs have received training on new born care, Navjat Shishu Suraksha Karyakram (NSSK), Maternal death review (MDR) and immunization. Medical officer of all six PHCs (except PHC at Nani Tumbdi) have received training on RTI/STI, integrated management of neonatal and childhood illness (IMNCI) and SBA or basic emergency obstetric care (except PHC at Zarpara) and directly observed treatment short course (DOTS) (except PHC Bhujpur). Similarly, medical staffs at four out of six PHCs have received training on vector born disease control program (VBDCP) (except PHCs at Bhujpur and Nani Tumbdi) and, adolescent reproductive sexual health (ARSH) (except PHCs at Bhujpur and Gundiyali) (Table 3.5– appendix 1).

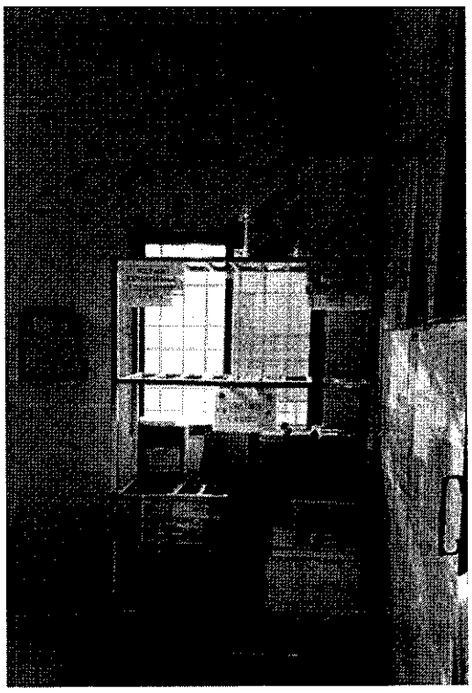


Investigation and Laboratory Services

Among investigation /laboratory services, facilities for urine analysis, pap smear test, sputum test, blood sugar test, RPR for syphilis and pregnancy test are available at district hospital, both CHCs and all six PHCs covered whereas hematology test, blood creation, diagnosis of RTI/STD with wet mounting, grams stain test coomb's test, widal test and X-ray facility is available only at district hospital and both CHCs. Apart from this, some of the investigation facility like stool (PHC Gundiyali), diagnosis of RTI/STDs with wet mounting grams stain (Bhujpur, Nani Tumbdi and Gundiyali PHCs)), ELISA test for HIV (Mota Kandagara & Gundiyali) and VDRL test (Mota Kandagara) is available at few PHCs. However, most of the investigating/laboratory facilities mentioned in the table are available at district hospital Bhuj only and are not supposed to be available at CHCs and PHCs as per standard norms (Table 3.6– appendix 1).

3407

Other Services



Other services like conducting deliveries (normal and assisted) and new born care, administration of parental oxytopics, antibiotics, administration of magnesium sulphate injection, management of post-partum hemorrhages, management of other delivery complications, management of low birth weight babies and C-section are available 24x7 at district hospital and both CHC at Mandvi and Mundra. In addition, blood storage facility, services like resuscitation, thermal protection, manual vacuum aspiration (MVA), electric vacuum aspiration (EVA) and dilation & curettage are also available at district hospital and both CHCs (Mandi & Mundra). Services for conducting normal deliveries and new born care, administration of parental antibiotics and resuscitation are available at PHC Zarpara and PHC Bhujpur, PHC Talvana and PHC Gundiyali. Besides, resuscitation facility at PHCs (Bhujpur, Talvana and Gundiyali), thermal protection at PHCs (Bhujpur&Gundiyali) and manual and electric vacuum aspiration are available at PHC Zarpara (Table 3.7 -appendix 1).

Essential drugs storage in PHC Gundiyali, Kachchh

Supply of Healthcare Kits

So far as supply of health care kit is concerned, all kits mentioned in Sr. 1 to 9 of Table 3.8 are available at CHC Mundra. This information, however, is not obtained from district hospital (Bhuj) and Sub district hospital (Mandvi). The same is true for PHC Bhujpur barring Kit O and Kit P (donor blood transfusion). In that respect the worst could be seen in PHC Kandagara where there is no supply of any kit mentioned in the Table 3.8. PHC at Nani Tumbdi has supply of only one kit, i.e. Kit I (normal delivery equipment) whereas PHC Talvana has supply of four kits (emergency obstetric care drug kit, RTI/STI laboratory kit, Kit G (IUD insertion kit) and Kit N (equipment for neonatal resection)and PHC at Gundiyali has RTI/STI laboratory kit, Kit G (IUD insertion kit) and Kit N (equipment for neonatal resection), Kit I (normal delivery kit/labour room kit) and Kit N (equipment for neonatal resection)(Table 3.8 -appendix 1).

Cold box and vaccine storage at PHC Zarpara

Stock of Specific Items

Among other supplies, stock of specific items like Nirodh pieces, Oral pill cycles, IUDs, IFA (large), Vitamin A solution and ORS packets are available at all six PHCs and one CHC at Mundra. However, this information has not been obtained from district hospital and sub district hospital at Mandvi (Table 3.9 -appendix 1).

Equipments

Equipments such as Cardiac monitor, Oxygen cylinder, Shadow less lamp pedestal for minor OT, High pressure sterilizer (horizontal /vertical), X-ray machine (functional), ECG machine (functional), Ice Lined Refrigerators and Deep Freezer are available at CHC Mundra. At PHC level, cold chain equipment and deep freezer are available at all six PHCs whereas ice lined refrigerator is available in all but Nani Tumbdi PHCs and shadow less lamp pedestal is reported to be available at only three out ofsix PHCs i.e. Bhujpur, Talvana and Gundiyali (Table 3.10-appendix 1).

Adequacy of Means

Based on the criterion of adequately equipped (if health center is having 60 percent of sanctioned, infrastructure, supply, equipment, etc.) position of the Primary Health Centers, Community Health Centers and District Hospitals have been given in the Table 3.11, 3.12 and 3.13 respectively.

3409

According to Table 3.11, PHC Mota Kandagara adequately is equipped in medical staff, paramedical staff and supplies but not in infrastructure and equipments. PHC Zarpara is adequately equipped in infrastructure, medical staff, paramedical staff, supply and equipment. PHC Bhujpur is adequately equipped in medical staff, paramedical staff, supply and equipment. PHC Nani Tumbdi, is equipped adequately in infrastructure, medical staff, paramedical staff and supply. In the two PHCs of Mandvi- Talvana and Gundiyali the latter is more adequately equipped than Talvana in terms of paramedical staff and equipment.

A view of G.K. District Hospital, Bhuj, Kachchh

Community Health Centres (Table 3.12) at Mandvi and Mundra too are adequately equipped as per the criterion. Mandvi Community Health Centre is lacking in terms of staff position such as General Surgeon, Radiologist and a Dental Assistant whereas in the Mundra CHC, General Surgeon, Pediatrician, Radiographer and Dental Assistant are not in position.

According to Table 3.14, the District Hospital at Bhuj is adequately equipped so far as infrastructure, medical staff, paramedical staff, supply and equipment are concerned. Barring Dilatation and Curettage (D&C) and Facility of Blood Bank, the

District Hospital is adequately equipped (Tables 3.11, 3.12, 3.13 and 3.14 – Appendix 1).

Infrastructure includes overhead tank pump and facility, electricity in all parts of hospital, availability of generators, telephone functional vehicles, laboratory, operation theatre, and separate aseptic labour room.

1. Includes obstetrician/gynaecologist, paediatrician and anaesthetist.
2. Include staff nurse. ANM, pharmacist, laboratory technician, PHN, health assistant

Waiting Area of Maternity Ward Of PHC Gundiyali, Mandvi, Kachchh

male and female.

3. Includes tual ring, set of standard surgical kits, emergency obstetric care kit, new born care kit, RTI/STI kits and delivery kit I.
4. Includes Boyle's apparatus, shadow less lamp and oxygen cylinder.
5. Calculated from the number of health facilities which facilities have conducted delivery.

Chapter 4: Health Index Measurement

Better health status of the population leads to demographic transition steadying the population growth rate essential for sustainable development. Health index provides relative measures of the health status of a particular area or population.

In the present study efforts were made to develop methodology for measuring the health index for 16 project villages and compared with blocks and district in which these villages fall. In order to do so, secondary data from six PHCs, two CHCs and district hospital were collected. In addition, relevant data from Census (2011), IDSP (2017-180, HMIS (2017-18), and Human Development Report of Kachchh district (2016) were pooled for this purpose.

Health Management Information System (HMIS) is the main source of data for public health indicators covered under National Health Mission (NHM) that combines both National Rural Health Mission (NRHM) launched in 2005 and National Urban Health Mission (NUHM) initiated later in the year 2013. In addition, Government of India also initiated Integrated Diseases Surveillance Programme (IDSP) under National Surveillance Programme for Communicable Diseases (NSPCD) to strengthen diseases surveillance for communicable and non-communicable infectious diseases to detect and respond to outbreak immediately. IDSP data is collated at National Centre for Diseases Control (NCDC) by compiling State/District surveillance data to interpret diseases trend in any specific area of the country. However, there has been several limitations of reporting and compiling diseases related data at PHC, CHC and even at District level.

Table 4.1 indicates that data for most of the infectious diseases are not available at all levels. Even if data is available for some diseases, the numbers are too small. Thirdly, there have been relative inconsistencies in PHC, CHC and DH data. Consequently, HMIS data on relevant public health indicators was used for developing Health Index (HI).

3412

It must be mentioned that efforts were made to use IIM Ahmedabad methodology for development and estimation of Health Index for the 16 project villages. IIM Ahmedabad collected data on a large number of outcome and input variables and ran the principal component analysis to identify factor loadings/weights of a smaller set of variables and classified the Indian States according to outcome and input factors. Taking lead from there, detailed schedules were developed for collecting secondary data from PHCs, CHCs and the district hospital.

However, a number of difficulties were faced in applying the method:

a. Lack of data at all levels –village, PHC and CHC– for all the outcome and input variables
b. A low case- variable ratio that does not permit us to apply factor analysis
c. While some values are shown in percentages, e.g. percent ANC-4, other values are given in absolute numbers, e.g. malaria in children 0-5 years of age
d. There is also a methodological issue. The project villages are subject to three different effects - intervention effect, programme effects, and other effects such as ongoing development and media effects. Therefore the difference, if any, between baseline and endline indices cannot be routinely attributed to intervention effects only

   In notations, change in health status of the Project villages

   $\delta V = \delta I + \delta P + \delta O$

   δI = change in health status due to intervention

   δP= change in health status due to programme

   δO= change in health status due to other effects

   Therefore, $\delta I = \delta V - \delta P - \delta O$
e. At the grassroots level there is an interaction between input and outcome processes.

Keeping the above facts in mind we first identified all the variables on which information for all aspects of health is available at the village level. Those variables are:

1. % Pregnant Women who received four or more ANCs
2. % Pregnant Women who are not anemic i.e. HB >11 Mg
3. % Total Institutional Births
4. % Live Births (among total pregnancies)

5. % Live Births > 2.5 KG
6. % Mothers received TT
7. % Children who received BCG
8. % Children immunized for measles
9. % Children who received Vit-A
10. % Infant Survived Till the First Birthday

Then seven more variables were identified on which information for both the Blocks were available. They are,

11. % Pregnant Women Examined for Syphilis
12. % Women Getting 1st Post Partum Checkup Between 48 Hours and 14 Days
13. % Newborns Breastfed within 1 Hour of Birth to Total Live Births
14. Sex Ratio at Birth (Female Live Births/ Male Live Births *1000)
15. %Children Fully Immunized (9-11 Months)
16. % Children Immunized for both BCG and Measles
17. % Children (0-5 Yrs) who never had Diarrhea

Except sex ratio, values of all the indicators lie between 0 and 100. Now the values of different indicators were standardized using the formula:

$$SI_i = \frac{SI_{iv} - MinSI_{id}}{MaxSI_{id} - MinSI_{id}}$$

Where SI_i refers to standardized value of the i^{th} indicator, $MinSI_{id}$ refers to minimum value of the SI_i, for any district in Gujarat and Max SI_{id} refers to the maximum value of the SI_i for any district in Gujarat. It may be noted that originally some indicators such as infant deaths in one year moved in a reverse direction. For exhibiting them in the table of health indicators they were replaced by a positive indicator by subtracting their value from 100. For them the following formula was used to arrive at SI_i:

$$SI_i = \frac{Max\ SI_{id} - SI_{iv}}{Max\ SI_{id} - MinSI_{id}}$$

Finally, the Health index was defined as an average value of all the SI_is. Separately, all SI_is lie between 0 and 1. Therefore, the average of them also lies between 0 and 1.

Using the same approach SI_is were computed for the Block level 17 indicators. Finally, the similar exercise was done for the district in which these Blocks and villages fall. Finally, a number of health indices were constructed:

- Village Health Index based on ten variables
- Block Health Index based on ten variables
- Block Health Index based on all 17 variables
- District Health Index based on all 17 variables
- State Health Index based on all 17 variables

The health indices lies between 0 and 1 and for analytical purpose, may be broadly interpreted as the probability that a randomly selected person from the population is healthy. Here, health is defined in the context of Gujarat as the framework of good and bad indicators depends on the minimum and maximum values for different districts of Gujarat. One may use the standards of India as well and compute new indices but health being a state subject and socio-economic and cultural conditions within states being more homogeneous it makes greater sense to use state standards.

To test for the significance of difference in health indicators, interpreted as probabilities, the test for independent samples is applied

$$t_{n1+n2-2} = \frac{p_1 - p_2}{\sqrt{\frac{p_1 q_1}{n_1} + \frac{p_2 q_2}{n_2}}}$$

Where, n_1 refers to the size of one sample and n_2 to the size of the other sample. For villages and Blocks the respective values of n_1 and n_2 are 16 and 2.

For comparing villages and Blocks with the district, 95% confidence interval is estimated and it is checked whether the district and state Health Indices fall within the confidence interval or not. The confidence interval is given as:

$$p_1 \pm 2 \sqrt{\frac{p_1 q_1}{n_1}}$$

We believe that change of any other more sophisticated formulae would not change the inference considerably.

Findings

Tables 4.2 and 4.3 exhibit the estimates of Health Index. Table 4.2 is based on 10 indicators for which all data were available for all the 16 villages. Table 4.3 is based on 17 variables for which data were available only for Blocks, district and the State.

Table 4.2 shows that the Project villages are better than the Blocks in the following aspects:

1. ANC- 4
2. Live Births

On the other hand the Project villages are not as good as the Blocks in terms of:

1. Anemia among pregnant women
2. BCG among children

The table also shows that the Project villages are better than the district in terms of:

1. ANC – 4
2. Live Births
3. Infant Survival

But the villages are not as good as the district in terms of anemia, %TT injection and BCG.

Table 4.2 shows that the estimate of the village Health Index is 0.81. The estimate of Block Health Index is 0.75.

It is found that the difference between the village Health Index and the Block Health Index is not statistically significant (t= .19). The 95% confidence interval of the village Health Index is .7 – .91 which contains the value of the district, but not the State and, therefore, it may be said that the differences between villages, Blocks and district are not statistically significant. Yet, the 16 project villages are significantly better than the state.

Table 4.3 shows that on the basis of 17 indicators of health, the two Blocks seem to be slightly backward Blocks (.62) of the district (.65) but they are at the same level of health as the Gujarat state (HI=.62).However, the difference between Blocks and the district is not statistically

significant (t = -.15). The 95 percent Confidence Interval of the Health Index of the two Blocks is - .10 – 1.26 and the value of the Health Index of the district lies within this interval.

Medical Officer at PHC Mota Kandagara, Kachchh

Table 4.3 also exhibits that when 17 rather than 10 indicators are used there is deterioration in the Health Index at all levels – Block, district and state. This is because of the relatively lower values of sex ratio at birth, full immunization, breastfeeding and diarrhoea at all the levels. This implies that the project should particularly focus on gender sensitization and full immunization amongst children. Since the health indicators for them are lower, greater investment in these aspects of health may yield better results and will be cost effective.

Limitations

There are several limitations of the study:

1. In developing the health index, input and outcome variables are not separated because the outcome variables such as IMR, <5 MR cannot be estimated at the village level
2. In cases such as diarrhea in children 0-5 years of age the size of exposed population is not available and therefore in constructing the index total population of the village, Block, district or state was used for computing indicator ratios.
3. Due to errors in data and otherwise due to specific rule of standardization, if a SI showed a value of more than 1 it was replaced by 1.

3417

Table 4.1 Absolute number of cases reported at different PHC, CHC and DH for Communicable and Non-Communicable diseases – 2017-18 (as per WHO indicators)

Diseases List	Kandagara Mota	Jarpara	Bhujpur	Nani Tunbadi	Talwana	Gundiy ari	CHC-Mundra	DH-Bhuj

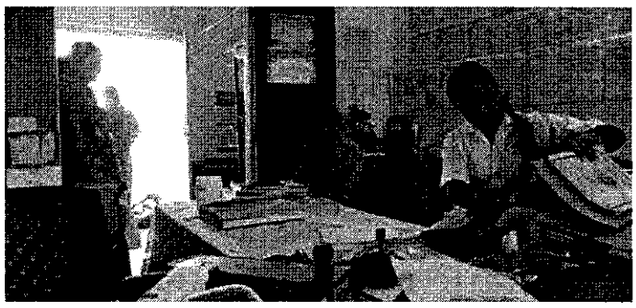
Chapter 5: Conclusion and Recommendations

The present study broadly attempted to examine the adequacy of government health services and determining the health index of 16 project villages in comparison of *Taluka*(Block) and District as a whole. For this purpose, IDSP and HMIS data of six PHCs, two CHCs and District Hospital were examined and facility survey was conducted.



The analysis of facility survey data indicated that more or less all six PHCs are adequately equipped to provide primary healthcare services to their respective catchment areas. While both the CHCs are not adequately equipped as per the norms particularly, in areas of medical and para-medical staff affecting the delivery of specialized medical services to PHCs referral patients. However, District Hospital at Bhuj seems to be adequately equipped in terms of infrastructure, medical and para-medical staff in position, supply and equipments compensating the demand of specialized medical services of both rural and urban areas of the district.

A broader view of PHC Gundiyali, Kachchh

Due to limitations of IDSP data on communicable and non-communicable infectious diseases, HMIS data on relevant public health indicators was used for developing health indices. Further, due to non-availability of village level public health data at PHCs, health index for 16 project villages falling under six PHCs of Mundra and Mandvi CHCs was measured on 10 available health indicators. The analysis demonstrated that project villages are better than the block average in terms of ANC coverage and live birth but lag behind anaemia among pregnant women and BCG vaccination coverage.

It was also found that project villages are better than the district in ANC coverage, live birth and infants' survival but the project villages are not as good as the district in terms of anaemia, %TT and BCG. It is evident from Table 4.1 that the Health Index of project villages are 0.81 as compared to block level of 0.75. Moreover, the differences between project villages, block and district are not statistically significantly though better than the state.

Doctor examining patient in PHC Mota Kandagara, Mundra, Kachchh

Further, considering all 17 health indicators available for Block, district and state rather than 10 indicators, the health index at block, district and state levels deteriorated because of the relatively lower values of sex ratio at birth, full immunization, breastfeeding and diarrhoea at all the levels. This implies that the project should particularly focus on gender sensitization and full immunization coverage amongst children. Since the health indicators for them are lower, CRS investment in coordination with government existing Health facilities which are by and large adequately equipped may yield better results and will be cost effective too.

Based on the present exercise, it is greatly felt that there is a need for collecting primary data at village level on all major health indicators at the household level in all intervention villages to have more sound estimates. For instance, If we have primary data on deaths by age we can calculate life expectancy at the village/Block level for comparison between the start of the intervention and its completion even without data on age distribution. Life expectancy is a good summary measure of health and changes in age-distribution of deaths will affect the changes in the disease burden, due to communicable and non-communicable diseases and other causes and overall improvement in life expectancy. It is further suggested that a few qualitative interviews with stakeholders and administrators will also help in identifying the priorities areas and the approaches to delivery which is area-specific and as per the needs of the people.

Alternatively, if it is not possible to collect primary data at village level, the baseline value of 0.81 may be taken as the value of Health Indicator of the Project villages and using the same methodology a similar value may be obtained for project evaluation in the endline study. This comparison will show the effect of project intervention net of other factors which may change the health conditions in the villages.

EAC OBSERVATION:

Details regarding disposal of arsenic bearing sludge has not been submitted.

REPLY:

Effluents from the gas cleaning plant of Sulphuric Acid and Copper Refinery will be treated in a state of art Effluent Treatment Plant (ETP) facility with tertiary treatment to remove arsenic as arsenic bearing sludge and segregation of clean chemical gypsum. The process flow is shown as below.

The Arsenic bearing sludge generated in ETP will be sent to Secured Land Fill (SLF), which will be constructed as per CPCB Guideline. Greenbelt of 15 m width will be developed all around the storage area. For construction of secured land fill (SLF) refer **Annexure-11(b)**.

Disposal Procedure:

Arsenic bearing sludge will be collected at the outlet of the filter press in the truck and will be transported to SLF for safe disposal. Waste shall be discharged by tipping at the working area of the SLF. Once the waste has been discharged it shall be spread in layers and compacted with the help of Roller in a well-defined manner to ensure that the completed slopes are at the designated gradients. Water sprinkling will be carried out through water tankers within SLF area for dust suppression.

Leachate collected through the leachate collection system will be sent to ETP through pipeline for treatment purpose and the treated effluent will be recycled for the plant operations.

EAC OBSERVATION NO.-13

3437

Characteristics of the Arsenic Bearing Sludge:

Parameter	UOM	Value on Dry Basis (Wt/Wt)
Iron	%	45 - 54
Arsenic	%	10 – 12
Copper	mg/l	1300 – 2100
Bismuth	mg/l	65 -185
Cadmium	mg/l	<15
Chromium	mg/l	<15
Cobalt	mg/l	<20
Nickel	mg/l	<15
Lead	mg/l	20 – 50
Antimony	mg/l	<20
Selenium	mg/l	20 – 40
Zinc	mg/l	1100 – 2500
CaO	%	14 – 18
Sulphates as SO_3	%	20 – 25
Silica	%	<0.5%
Moisture	%	35

Dust from the Landfill:

Dust from landfill operations is mainly a problem during periods of dry weather. Fugitive dust control will be addressed by:

a. Limiting vehicle speed;
b. Spraying roads with water; and
c. Spraying site and powder type waste with water;
d. Green Belt around the Landfill.

Road Maintenance:

To avoid the mud/ dust is not carried off site by vehicles adequate wheel cleaning facilities will be provided. The water after cleaning will be recycled back in the ETP operation.

Landfill Safety Aspects:

Employees training shall include site safety, first aid and the handling of dangerous materials where appropriate. Emergency plans shall be laid down. Landfill sites shall be regarded as potentially hazardous locations and the operator shall have a written safety plan for the site and Safety hazards present at landfill sites. All employees and visitors to

the site shall be made aware of the potential hazards and the safety procedures to be implemented including fire safety.

Record Keeping:

Record keeping procedures as well as waste acceptance procedures to be followed at the landfill site shall be formulated.

Records shall be kept as per the consent conditions. In addition a site Manual shall be kept at the site office giving all site investigation, design and construction details.

Landfill Closure:

When landfill reaches the final height, it will be closed as per CPCB Guidelines. HDPE liner with 1.5 mm thickness will be used for landfill cover. It is compacted with smooth steel drum rollers and provided a suitable gradient (3 to 5%) to encourage surface water to run-off from the cover and thus minimise infiltration. The side slopes of the intermediate cover are compacted by the crawler tracked dozer moving up and down the slope. An access road is provided on the landfill cover to enable easy approach for routine inspection of the landfill cover. Long-term vegetative stabilisation will be undertaken to return the land to its original and natural vegetative landform.

Landfill Layout Display Board:

A site layout will be displayed at the entrance of the SLF entry in Local as well as Hindi and English language. Layout will typically will include:

a. Access roads;
b. Equipment shelters;
c. Temporary waste storage and/or disposal sites for special wastes:
d. Demarcation of the landfill areas and areas for stockpiling cover maternal and liner material;
e. Location of surface water drainage facilities,
f. Location of landfill leachate management facilities;
g. Location of gas management facilities (optional);
h. Location of monitoring wells/environmental monitoring facilities,
i. Fencing and green belt along the peripheral boundary and
j. Emergency exit.

3439

EAC OBSERVATION NO.-14

EAC OBSERVATION:

Mercury in ambient air has not been monitored.

REPLY:

Mercury (Hg) in ambient air was monitored during January and February 2019 at eight locations within the 10 km radius of study area.

For the mercury sampling IS: 5182-Part-23 has been followed. The collected sample has been extracted by microwave extraction (Method IO-3.1) method. The extract has been analysed by the ICP MS having least count of 5.0 ng/m^3.

The Hg content in the ambient air found to be <5.0 ng/m^3.

Details of Mercury in ambient air sampling locations and analysis is provided in **Annexure-14.**

ANNEXURE-14
MERCURY ANALYSIS IN AMBIENT AIR

1.0 INTRODUCTION

During the EAC meeting, it was desired by the EAC to monitor the concentration of mercury in ambient air quality within the study area. Hence, mercury concentration in ambient air was monitored during 28th January, 2019 till 2nd February, 2019 at eight locations within the 10 km radius study area. The sampling methodology and concentrations are given below:

The details of sampling locations are given in **Table-1** and shown in **Figure-1.**

TABLE-1
DETAILS OF AMBIENT AIR QUALITY MONITORING LOCATIONS

Station Code	Location	Distance from Centre of Project Site (km)	Direction w.r.t. Centre of Project Site

AAQ3	Bhujpar Mota	6.2	NE
AAQ4	Jarpara	6.8	ENE
AAQ5	Wandh	1.8	SW
AAQ6	Kandagara	4.4	NW
AAQ7	Siracha	1.7	NNW
AAQ8	Moti Khakhar	5.9	NNW

2.0 METHODOLOGY OF SAMPLING

Sampling Procedure

For the mercury sampling, IS: 5182-Part-23 has been followed. The Respirable Dust Sampler (RDS) has been used and 24-hour sample was collected by using whatman filter paper (8 inch x 10 inch). Flow rate of 1.0-1.5 m^3/min has been maintained. During the monitoring period, hourly reading of flow rate has been recorded to capture the flow fluctuations. After the required time of sampling, the flow meter reading was recorded and the filter paper from the sampler and put in a envelope for further analysis.

Sample Storage

After collecting samples, The filter papers have been transported the laboratory, taking care to minimize contamination and loss of the sample. These samples have been stored in a protective environment up to 30°C until analysis. Even though, the sample holding can be up to 180 days, the samples have been analyzed within 10 days' time after collection.

Extraction of Samples

The collected sample has been extracted by microwave extraction (Method IO-3.1) method. The extract has been injected into the ICP MS.

3441

ANNEXURE-14
MERCURY ANALYSIS IN AMBIENT AIR

Microwave Extraction

The filter paper was cut 1"x 8" strip or half the filter from the 8"x10" filter sample and placed on its edge in a labeled centrifuge tube using vinyl gloves or plastic forceps. Using the plastic forceps, crush the filter strip down into the lower portion of the centrifuge tube to ensure acid volume will cover entire filter. Add 10.0 ml of the extraction solution to each of the centrifuge tubes (3% conc. HNO_3 and 8% conc. HCl). Place the centrifuge tubes in a 3Teflon vessel containing 31 ml of deionized water. Place the vessel caps with the pressure release valves on the vessels hand-tight and tighten using the capping station to a constant torque of 12 ft-lb. Place the vessels in the microwave carousel. Connect each sample vessel to the overflow vessel using the Teflon connecting tubes. Place the carousel containing the 12 vessels on to the turntable of the microwave unit. Irradiate the sample vessels at 486 W (power output) for 23 min.

Allow the pressure to dissipate, then remove the carousel containing the vessels and cool in tap water for 10 min. Using the caping station uncap the microwave vessels, remove the labeled centrifuge tube containing samples. Add 10 ml of deionized water to each centrifuge tube. Cap the centrifuge tube tightly and mix the contents thoroughly for 2-3 minutes to complete extraction. The final extraction volume is 20 ml based upon the above procedure. Filter the extracted fluid with Whatman No. 41 and make up the final volume to 100 ml, the filtered sample is now ready for analysis.

Metal Concentration

$C\ ng/m^3$ $(Ms - Mb) \times Vs \times Fa \times 1000/V \times Ft$

Where,

C = Concentration, ng/m^3

Ms = Metal concentration µg/ ml
Mb = Blank concentration µg/ ml
Vs = Total volume of extraction in Ml
Fa = Total area of exposed filter in cm^2
V = Volume of air sampled in m^3
Ft = Area of filter taken for digestion in cm^2

ANNEXURE-14
MERCURY ANALYSIS IN AMBIENT AIR

FIGURE-1
AIR QUALITY SAMPLING LOCATIONS

EAC OBSERVATION:

Conservation plan prepared for the Schedule-I species is not meeting the requirement of the conservation of the species that are identified. Therefore, the plan shall be revised considering the requirements of the conservation of the species identified and shall be approved by the competent authority concerned.

REPLY:

Wildlife & mangrove conservation plan for proposed project has been prepared in consultation with Divisional Forest Office, Kutch District East. The study was conducted during month February-March 2019. During the primary field survey study total 8 faunal species belong to Schedule-I of Wildlife Protection Act 1972 were found in the study area. These species include 2 species of reptiles, 5 species of birds and one mammal.

The impacts during construction phase could be short term, temporary in nature and will be confined to the close boundary of the project site. General ecological impacts anticipated from the construction and operation phases of the copper refinery plant and mitigation measures are presented in the report as **Annexure-5**.

Budget provision of Rs. 193.5 Lakhs for conservation for Schedule-1 species as per field scientific study has been proposed.

The financial allocation for wildlife conservation activities including Mangroves protection measures is about Rs. 443.5 lakhs.

A detailed report (**Annexure-5**) is submitted to Divisional Forest Officer (Kutch- East) and it is forwarded by Divisional Forest Officer (DFO) to Chief Conservative of Forest (CCF). CCF has forwarded Conservation Plan to Chief Wildlife Warden (CWLW) of the state for the approval process.

SPECIES OF HIGHER CONSERVATION SIGNIFICANCE PRESENT IN THE STUDY AREA

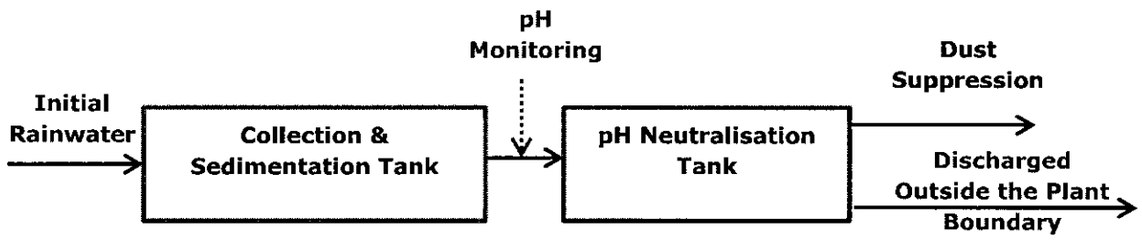
SAMPLING LOCATIONS FOR FLORA AND FAUNA STUDY IN THE BUFFER AREA

SAMPLING LOCATIONS FOR FLORA AND FAUNA STUDY IN THE CORE AREA

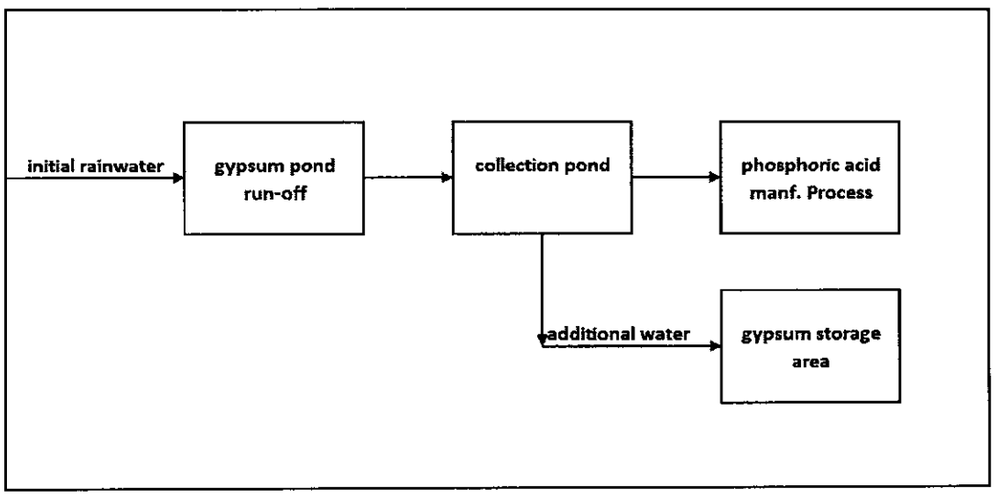
EAC OBSERVATION:



Collection of runoff water from the raw material storage area, slag and gypsum storage yard and its treatment has not been submitted.

REPLY:

Treatment of Initial Rainwater



Part A: (raw material storage area & slag)

The rainwater runoff from raw material storage area & slag will be collected in a storm water collection pond for sedimentation of suspended solid materials. Provision for pH monitoring and provision for neutralisation will be made as required. The preliminary flow diagram is as shown below. The water after sedimentation and neutralisation will be utilised within the plant for dust suppression in raw material storage areas and copper slag granulation. The balance water will be discharged outside the plant boundary after conforming to the discharge standards. The bottom sludge of the sedimentation tank will be recycled back to smelter.

Part B: Treatment of Initial Rainwater (Gypsum Storage)

Collecting amount of initial rainwater: The initial rainwater in gypsum storage area will be collected through the garland drains to the dedicated collection pond of 4,000 m^3. This water will be reused in the phosphoric acid manufacturing process and for dust suppression in the Gypsum Storage Area.

EAC OBSERVATION NO.-17

- Considering only 80% of the run-off as available volume after evaporation, spillage and other losses, 2,21,433 m^3 (0.221 MCM) of rain water will be available from Smelter, Production Plant, Storage and Landfill areas for use in the production process, green belt/plantation, toilets etc.
- Considering only 80% of the run-off as available volume after evaporation, spillage and first flush wastage, 5,566 m^3 (0.006 MCM) of rain water is available from the roof top areas for harvesting and use.
- Considering 25% of the roads and paved area 50% of the green belt area free from contamination, 84,877 m^3 (0.085 MCM) of run-off from the rainfall collected in these areas is available for harvesting after 20% of this run-off accounting for evaporation, spillage and other losses.
- The amount of run-off available from the above areas if managed with at least 70% efficiency will be 63,310 m^3 (0.063 MCM), which would meet 69.96% of proposed green belt water requirement.

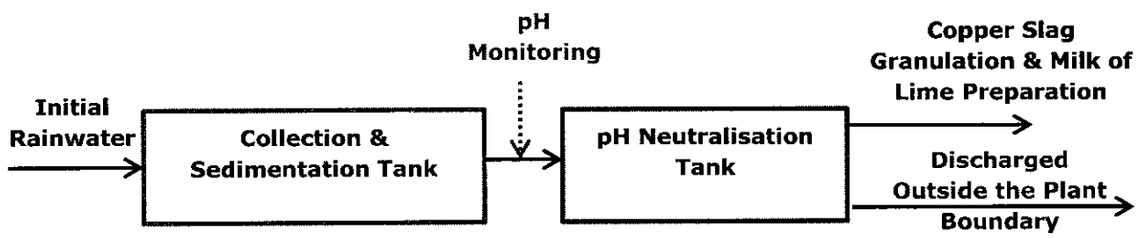
  A detailed report on hydrogeology and rainwater harvesting has been conducted and is available as **Annexure-18**

EAC OBSERVATION NO.-17

EAC OBSERVATION:

Study on installation of rain water harvesting structure based on annual rain fall pattern and details regarding amount of water to be conserved has not made available.

REPLY:



a. Rain Water Harvesting for the Administrative Building Premises:

The annual volume of rain water available from the project site is to be 5566 m^3/year after runoff and evaporation losses. Two nos. of 4,000 m^3 capacity each for rain water collection are proposed for the project.

The initial rainwater collecting tank shall be installed in the areas to collect the all roofs runoffs from the administrative buildings. The run offs will be pass through the sand soak pits and reused for domestic sewage requirements (Flushing purpose).

b. Rain Water Harvesting for the Production Plant Premises:

The initial rainwater collecting tank shall be installed in the areas to collect the all rooftops runoff. The same will be connected to a common collection tank; where the runoff from the other areas such as raw material storage, Smelter Plant area is collected in a storm water collection pond. Here, the provision for pH neutralisation will be provided. The water after sedimentation and neutralisation will be utilised within the plant for copper slag granulation and milk of lime preparation. The balance water will be discharged outside the plant boundary after conforming to the discharge standards.

ANNUAL & MONSOON RUN-OFF FROM PROJECT SITE

Sr. No.	Land Use	Area (ha)	Run-off Coefficient	Annual Rainfall (m)	Annual Run-off (m^3)	Monsoon Rainfall (m)	Monsoon Run-off (m^3)
1	Buildings/sheds	2.30	0.7	0.432	6957	0.425	6833
2	Plant & utilities	56.76	0.7	0.432	171817	0.425	168738
3	Roads & paved area	59.13	0.9	0.432	230132	0.425	226007
4	Green belt	89.84	0.25	0.432	97126	0.425	95385
5	Storage of Solid Waste (Copper Slag, Phospho-gypsum & SLF)	48.55	0.5	0.432	104975	0.425	103094
Total		**256.58**	**0.61**	**0.432**	**611007**	**0.425**	**600057**

- The annual volume of rain water available from the project site spread in 256.58 ha (634 acres) is estimated at 6,11,007 m^3 (0.61 MCM) and during SW and NE monsoon periods is 6,00,057 m^3 (0.60 MCM).

EAC OBSERVATION NO. -18

TDS of Moti Khakhar, Desalpar and Siracha (2660.7 mg/l to 3322.3 mg/l), Total Hardness of Siracha (659.9 mg/l), Chlorides of Siracha (1321.6 mg/l), Sulphates of Moti Khakhar (486.5 mg/l), Manganese of Siracha (0.36 mg/l) and Iron of Jarpara (0.31 mg/l) samples show higher values than permissible limits. In the present study, water type of all ground water samples is Sodium Chloride indicating brackish/saline origin.

The present stage of ground water development in the study area is estimated as 102.37% and can be categorized as "Over-exploited". However no ground water extraction is envisaged for the Project.

The Secured Land Fill will have impervious layers of clay liner and HDPE liner. This will ensure that the ground water will not be impacted by the storage of the ETP cake. In case of any rupture/breakage or failure of the SLF bottom liner, any contaminant reaching sub-surface strata and water table will move towards Gulf of Kachchh following the ground water flow direction in the project area.

Danesri Nadi, a seasonal stream passes through western part of the project site. Danesri Nadi originates from north of study area (3.80 km from study area) and has a catchment area of 3.75 sq km from railway line near project site. There are no other drainage courses in the project site. Danesri Nadi along the project boundary will not be disturbed and maintained with necessary bank stabilization will be done with compaction/stone pitching and raising the bund up to 2.0m. The Danesri Nadi conservation plan will include a 50 m corridor from HFL along the stream course for green belt development and another 50 m along the green belt where any storage is coming (Total of 100 m from HFL along the stream course near the storage areas) as presented in plant layout hereunder. No effluent will be discharged into this stream from the plant. Storm water drains carrying excess storm water from the plant area will be provided sand filters to arrest any suspended particles and quality will be monitored periodically to ensure contaminant free storm water only reaches Danesri Nadi.

Impact on Hydrogeology

- Impact on water quality during construction and operation of proposed project will be anticipated due to following activities:
  - Sewage generated from the domestic facilities;
  - Wastewater generated from different plant operations;
  - Waste and oil spillage from the workshop;
  - Solid waste and hazardous waste disposal etc;
  - Runoff water from raw materials, products & fuel storage areas; and
  - During disaster (like failure of transportation of materials & fuel and overflow of hazardous chemicals & fuels from storage areas etc.).

- Anticipated surface water bodies environment will be affected by the proposed project as follows:
  - Disturbing natural water courses;
  - Change in drainage pattern of the area, quantity and quality;
  - Due to withdrawal of water or discharge of wastewater; and
  - Contaminated leachate from disposal/dumping of solid waste etc.

EAC OBSERVATION NO. -18

EAC OBSERVATION:

Impact on hydro geology regime of the project site has not submitted.

REPLY:

Detailed Hydrogeology studies were conducted in 10 km radius areas of the proposed copper Greenfield copper refinery project. No ground water is proposed to abstract for the project usage. The plant will be designed and operated on Zero Liquid Discharge (ZLD) system. No effluent will be discharged outside of the plant premises. Hence, there will not be any impact envisaged on ground water regime. Additionally, a ground water level monitoring system shall be established within the plant premises for monitoring of ground water quality.

The total study area of 413.68 sq km, 75.67 sq km (18.29%) of the southern part is covered by Arabian Sea, the Gulf of Kachchh. Remaining study area is entirely occupied by Holocene/ Quaternary sediments with surface lithological boundaries running almost parallel to coast line (E-W). Proposed project site, Adani Power & other industrial set-ups in APSEZ area are located on older coastal plain. Resistivity of different lithological units in the study area range from <1 Ωm to >300 Ωm. ERT1 and 2 are located in project site lying on older tidal flat and marsh deposit with resistivity ranging from <1.0 Ωm to 5.0 m. The resistivity at these locations decreases to <1.0 Ωm with depth indicating saline nature.

The average ground water recharge by rainfall infiltration and increment in ground water storage is 78.15 MCM. However, the huge difference in recharge by rainfall infiltration and increment in ground water storage indicates that the ground water draft is much more than ground water recharge.

The annual volume of rain water available from the project site spread in 256.57 ha (634 acres) is estimated at 6,43,658 m^3 (0.64 MCM) and during SW and NE monsoon periods is 6,32,123 m^3 (0.63 MCM). Considering only 80% of the run-off as available volume after evaporation, spillage and first flush wastage, 5,566 m^3 (0.006 MCM) of rain water is available from the roof top areas for harvesting and use.

Ground water in the study area is developed through shallow dug wells and tube wells for domestic, irrigation and industrial purpose. Dug wells are mainly seen along and in the stream courses and near water bodies/check dams. With the increase of tube wells in the area and lowering of water table, most of the dug wells are abandoned. The depth to water level in dug wells during field visit (2nd week of February 2019) ranges from 7.85 m to 16.12 m bgl whereas the depth to water level in tube wells ranges from 2.00 m bgl in Adani Power's piezometers near project site to 44.38 m bgl in an agricultural well near Gelada. The average water levels in dug wells during field visit, pre and post monsoon are 12.42 m, 12.13 m and 6.23 m bgl respectively with a water level fluctuation of 7.15 m.

General ground water flow direction in major part of the study area is towards Gulf of Kachchh with depressions of deeper levels below mean sea level between Bhadia Mota and Bhadia Nana, around Navinal and east of Bhujpar Mota. Reduced water levels <0 around Bhadia Mota, Bhadia Nana, Tragadi, CGPL and Wandh in the west and to the east of Bhujpar Mota in the northeast indicate that ground water movement is towards inland encouraging sea water intrusion.

EAC OBSERVATION NO. -18

3450

- Water level contours indicate that the water levels in and around Tragadi, Bhadia Nana, CGPL, Wandh, Navinal and Jarpara are below mean sea level and these areas are prone to saline water intrusion.

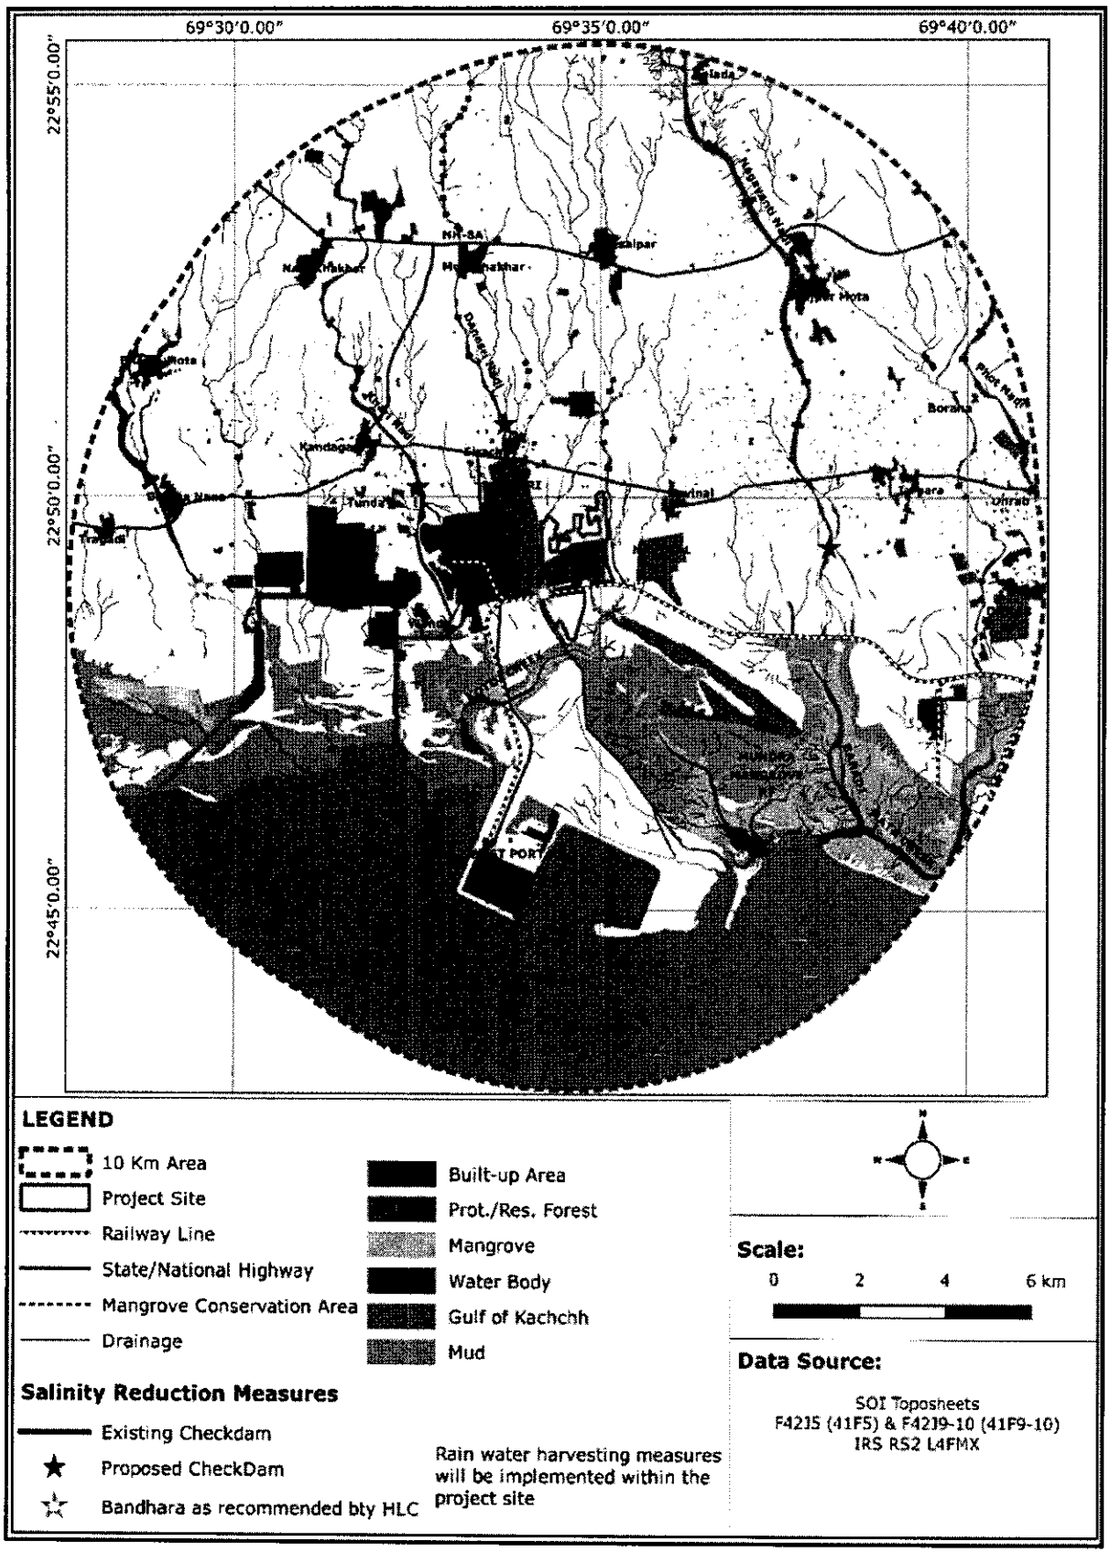
Conclusion & Recommendations

a) Measures for Rain Water Management & Treatment within the Proposed Project:

- Rain water from Concentrate Storage, Smelter Area, Slag Storage and Gypsum Storage will be collected in separate tanks installed in the areas of feed stock storage and conveying, smelting system and gypsum storage.
- Rain water from Production Plant premises will be collected in a separate tank installed in the plant premises to collect rain water from all roofs.
- The water collected in these tanks will be treated in initial rain water treatment station and then goes to the advanced treatment section of the production effluent treatment plant for treatment before it is reused for production and thereby reducing the fresh water consumption.
- Additional water if any will be used for spraying purpose in the Gypsum Storage area.

b) Mitigation Measures for Ground Water & Surface Water Contamination:

- Though ground water abstraction is not envisaged for the present project, the project proposes to implement drinking water supply to the nearby villages, afforestation, water spreading channels, check dams and bandharas, which would help in limiting the ground water grouabstraction, enhance ground water recharge and thereby reduce salinity in the area as a corporate responsibility.
- The Secured Land Fill (SLF) will have impervious layers of clay liner and HDPE liner. This will ensure that the ground water will not be impacted by the storage of the ETP cake.
- Danesri Nadi, a seasonal stream passes through western part of the project site. Danesri Nadi originates from north of study area (3.80 km from study area) and has a catchment area of 3.75 sq km from railway line near project site. There are no other drainage courses in the project site.
- The Danesri Nadi conservation plan will include a 50 m corridor from HFL along the stream course for green belt development and another 50 m along the green belt where any storage is coming (Total of 100 m from HFL along the stream course near the storage areas) as presented in plant layout.
- No effluent will be discharged into this stream from the plant. Storm water drains carrying excess storm water from the plant area will be provided sand filters and quality will be monitored.



Measures for reduction of salinity ingress in the study area:

- To control surface and subsurface salinity ingression along the coastal stretches
- To recharge and enhance the quality of underground aquifer of the coastal belt

- To promote agricultural activities by providing surface water facilities to the farmers in and around the constructed civil structures
- To achieve an overall improvement in socio-economic conditions of the village community in the vicinity of the constructed civil structures.
- Though, ground water abstraction is not proposed for the present project, based on the measures recommended by HLC-I & II and implemented under Salinity Ingress Prevention Scheme of Govt. of Gujarat, the following measures are proposed to be implemented in the vicinity of the project site as a corporate responsibility:
- A fund of Rs. 1600 Lakhs has been allocated for **Drinking water supply** to nearby villages **Siracha, Jarpara, Desalpar and Moti Khakhar**, which will limit the ground water abstraction through tube wells.
- A fund of Rs. 120 Lakhs has been allocated for carrying out afforestation activities with suitable species in village panchayat lands, waste lands, open lands in SEZ area, areas of degraded vegetation in public lands of owners motivated towards the community benefit, which will slowdown the surface run-off and enhance recharge.
- Water spreading channels along Mundra-Mandvi road on the upstream side, which will enhance recharge.
- Check dams across the stream course of Khari Nadi, Danesri Nadi and Nagavanti Nadi – dam constructed across a drainage course to reduce water flow velocity and thereby enhancing recharge.
- Bandharas near river/stream mouths of stream near Bhadia Nana, Danesri Nadi and Nagavanti Nadi as recommended by HLC in coordination with Salinity Ingress Prevention Scheme - bandharas are structures constructed near the mouths of rivers to top tidal/backwater ingress into the land by sealing the mouths of the rivers.

1.0 INTRODUCTION

1.1. Background

Adani Group is one of India's leading global integrated infrastructure players holding a company of M/s Adani Enterprises Limited (AEL). It was ranked among the top 50 Asian companies by Forbes Asia in 2009. Adani Enterprises is quoted on the Indian Stock Exchange, together with its four group companies – Adani Ports SEZ Limited, Adani Green Energy Limited, Adani Gas Limited and Adani Power Limited. M/s Adani Enterprises Limited is listed on the Bombay Stock Exchange (BSE) and National Stock Exchange of India (NSE).

Adani Enterprises Limited is one of the fastest growing diversified conglomerates with business interests across – Integrated Coal Management and mining, solar cells and module manufacturing, agri-storage infrastructure and services as well as edible oils and food products. This business mix – business-to-business and business-to-consumer – is directed at enhancing access to basic services (electricity through timely coal availability), creating a less polluted world, delivering quality food grain and providing healthy cooking media.

1.2 Project

M/s Adani Enterprises Limited (AEL) intends to set up a Greenfield Copper Refinery project at Adani Port Special Economic Zone (APSEZ) land in villages Siracha and Navinal, taluka Mundra, district Kutch, Gujarat. The project includes facilities like copper smelter, sulphuric acid plant, copper refinery, continuous cast copper wire rod plant, precious metal recovery plant, phosphoric acid plant, aluminium fluoride plant, effluent treatment plant, utilities storage of water and fuel etc. with state of art environment friendly technology.

M/s Vimta Labs Limited, Hyderabad has assigned Multi-Tech Services, Hyderabad carrying out geological and hydrogeological studies in 10 km radius area of proposed Copper Refinery project indicating the impact of the project on the water regime along with rain water harvesting and artificial recharge strategies.

1.3 Location, Extent and Communication

The proposed project will be located in Siracha and Navinal villages at APSEZ, Mundra taluka, Kutch district, Gujarat. AEL proposes to set up a Greenfield Copper Refinery project of 10 LTPA (1.0 MTPA) capacity in 256.57 ha (634 acres) of area.

The proposed project site lies between latitudes 22°48'15.65"N to 22°50'03.86"N and longitudes 69°33'38.12"E to 69°35'10.76"E. The area is covered by Survey of India toposheet no. F42J9-10 (41F9-10) on the scale of 1:50000.

Geographically, the study area lies between 22°42'49.30"N to 22°55'29.74"N latitudes and 69°27'45.00"E to 69°41'02.95"E longitudes and is covered by Survey of India toposheet nos. F42J9-10 (41F9-10) and F42J5 (41F5) on the scale of 1:50000. The study area encompasses the geographical area of Mundra and Mandvi taluks, Kutch district, Gujarat.

The proposed project site is well connected by the existing National/State highways, cargo rail link which is about 2.0 km away from the project site. The nearest airport is Mundra airport owned by Mundra International Airport Pvt. Ltd., a subsidiary of Adani Group located at 20 km in SE direction of the project site and another is at Bhuj, located at a distance of 65 km from the project site. The nearest railway station is Adipur/Gandhidham, which is about 80 km from project site and nearest town is Mundra which is about 20 km from the project site. The national highway NH-8A is passing at about 15.0 km away from the site. State highway SH-6 is about 3.0 km north of proposed site. The site is well connected with Ahmedabad city located at about 460 km.

Location of the proposed project site is shown in **Figure-1** and the study area is presented in **Figure-2**.

Figure-2. Study Area – 10 km Radius Area of the Project

1.4 Water Source and Requirement

The total water requirement for the project (phase-I & phase-II) is about 35,496 KLD (35.5 MLD). 32,267 KLD (32.27 MLD) would be sourced from desalination plant of APSEZ Limited and supply through M/s. Mundra Utility Private Limited (MUPL). Balance will be met from treated/blowdown recycled water for greenbelt/cover, lime slurry preparation and reverse osmosis plant and multi effect evaporator. The water allocation letter is enclosed as **Annexure-I**.

An integrated water system is proposed. The effluent from the process units is treated and reused to reduce water demand. It is also proposed to install a secondary Reverse Osmosis (RO) plant to further treat water from the effluent plant facility for effective use. Rejects from the reverse osmosis plant will be sent to Multi Effect Evaporator (MEE) for further recovery and solids generated will be sent to Secured Land Fill (SLF).

Water demand is made up of the following:

- Water for product purpose like sulphuric acid and phosphoric acid;
- Make-up losses for copper slag granulation preparation;
- Make-up losses in the cooling towers and heat exchangers/circuits;
- Steam losses from the steam and power systems; and
- Steam consumed directly in the process etc.

The details of usage of water and water balance are presented in **Table-1** and **Figure-3**.

Table-1. Water Requirement for Copper Refinery Plant

Sr.No.	Purpose	Raw (Fresh) Water m^3/day	Treated/ Recycled Water m^3/day	Total m^3/day

2.0 HYDROLOGY

2.1 Climate

The study area falls in South Kachchh and North Kathiawar Peninsular, which is hot arid Ecological Sub Region (L12Et2) with deep, loamy saline and alkali soils, low Available Water Capacity (AWC) and a Length of Growing Period (LPG) of 60-90 days.

Regional Climate around Bhuj

The climate in Bhuj area is called a desert climate. During the year, there is virtually no rainfall in Bhuj area. The average annual temperature is 26.3°C. The rainfall here averages 358 mm. Bhuj has a borderline hot desert climate just short of hot semi-arid climate. Although annual rainfall "averages" around 330 mm on 14.3 average rainy days, the variability is among the highest in the world with coefficient of variation of around 60%. Recorded annual rainfall has been as low as 21.9 mm in 1899 – yet in 1926 a total of 1,177.1 mm fell and in the incomplete year of 1959 rainfall exceeded 1,160 mm of which 730.6 mm fell during Bhuj's wettest-ever month of July 1959. The heaviest rainfall recorded in 24 hours was 467.9 mm on 15.07.1959.

Apart from the cool mornings of the "winter" season from December to February, temperatures are very warm to sweltering throughout the year, which further reduces the effectiveness of the erratic monsoonal rainfall. During the "hot" season from mid-March to mid-June, temperatures of 40°C are frequent, whilst during the monsoon season they exceed 34°C with high humidity except during rainy spells accompanied by cooler temperatures but oppressive humidity.

Climate around Mundra and Mandvi

The climate around Mundra and Mandvi area is called a desert climate. During the year, there is virtually no rainfall in this area. The average annual rainfall based on IMD data is 432.4 mm on 15 average rainy days. About 94.71% of the rainfall is received during South West monsoon (June-September). The highest average monthly rainfall, 206.92 mm occurs in July contributing 47.85% of the total rainfall.

A review of annual rainfall at Mundra and Mandvi for 124 years between 1879 and 2013 indicate that the average annual rainfall in the area during this period is 415.45 mm. The lowest rainfall recorded at Mundra and Mandvi are 30.80 mm and 2.20 mm respectively during 1987 whereas the highest rainfall recorded at Mundra and Mandvi are 1079.60 mm during 1961 and 1193.04 during 1926 respectively. The rainfall pattern in the area during this period shows a standard deviation of 222.01 mm with coefficient of variation of 54.21%.

The annual mean temperature is 26.2°C and monthly mean temperatures range between 10.1°C during January to 38.7°C during May. Summer temperature ranges from 18.3°C in March to 38.7°C in May. December and January are coolest months with temperature ranging from 10.1°C to 26.1°C.

Being arid climatic conditions, air is generally dry except during the monsoon season. However, the relative humidity in the coastal parts of the area is high throughout the year exceeding 60% on the average. During monsoon months, the relative humidity exceeds 80% in the coastal region and over 65% in the interiors of the area. The rest of the year the air is dry with relative humidity to the order of 25% or less. March and April months are the driest months.

The prevailing wind direction in the study area is south-westerly during summer and monsoon seasons and north-easterly during winter season. The mean wind speed ranges from 5.9 to 13 kmph during winter months and 26 to 36.9 kmph during monsoon months. During the months of April-May, the mean wind speed is around 17.5 to 23.8 kmph.

Meteorological data of Mundra and Mandvi from IMD, Bhuj is presented in **Table-2** and graphical representation is made in **Figure-4a&4b**.

Table-2. Meteorological Data of Mundra and Mandvi - IMD, Bhuj

Month	Temperature (°C) (Max-Min)		Humidity (%) (Max-Min)		Mean Total Rainfall (mm)		Wind Speed (km/hr)	
	Mundra	Mandvi	Mundra	Mandvi	Mundra	Mandvi	Mundra	Mandvi

Figure-4a. Climate Graph – Mundra

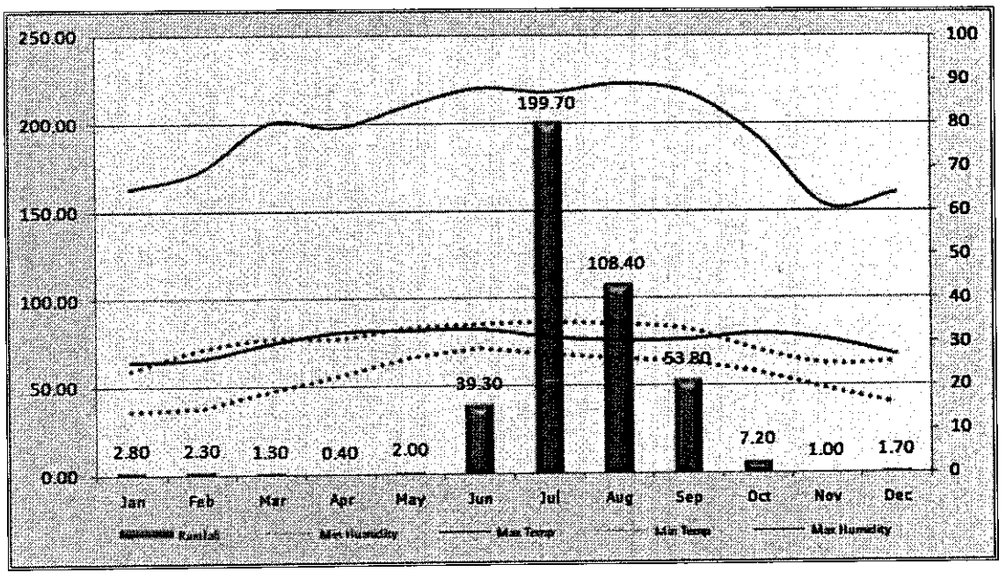

Figure-4b. Climate Graph – Mandvi

2.2 Physiography and Drainage

2.2.1 Physiography

Physiographically, Kachchh district can be divided into:

a) Central high land and the upland in the Rann area;
b) Central plain in the southern part;
c) Little and Great Rann areas; and
d) Banni plains.

The study area forms part of central plain with fringes of ridges in the northern part around Gelada. The study area is fairly flat with growth of prosopis juliflora. The highest elevation and lowest topographic elevations of the area are around 65.00 m (in the northern part west of Gelada) and 0.00 m above mean sea level (amsl) along coast line. The general slope in the study area is towards south towards Gulf of Kachchh. Elevation in the project site ranges from 3.0 m amsl in the south 9.0 m amsl in the north with general slope towards south into Gulf of Kachchh.

Danderi RF NW of project site, Siracha RF in the western part of project site, Navinal RF towards east of project site, Dhrab RF in the east (south of Dhrab) and Mundra Mangrove RF along Baradi Mata Creek are the forest covers in the study area.

2.2.2 Drainage

According to River Basin Atlas of India, Ministry of Water Resources, the study area forms part of B20RAN14, 15 & 16 watersheds in Rann Sub-basin of West Flowing Rivers of Kutch and Saurashtra including Luni Basin.

The drainage of the study area is largely governed by the combination of lithology and tectonics however, the influence of sea level fluctuations during Quarternary period is also obvious. Khari nadi (1.9 km, W), Danesri Nadi (in the western part), Naganandini (4.7 km, E) and Phot nadi (8.7 km, ENE) are the streams in the study area flowing southwards into Arabian Sea, the Gulf of Kachchh. The drainage network in the study area is generally dendritic to sub-parallel and controlled by these streams. These streams are seasonal and rarely seen in flowing condition only during peak rainfall events. The study area is having a drainage density of 1.27 km/sq km. There are a few small to medium ponds/tanks spread over the entire study area and a number of check dams were constructed on stream courses.

Kotdi creek towards south of project site and Boradi Mata creek towards southeast of project site are the major creeks in the study area. Arabian Sea, the Gulf of Kachchh is in the southern part occupying 18% of the study area. Physiography and drainage network in the study area is presented in **Figure-5**.

Danesri Nadi, a seasonal stream passes through western part of the project site. Danesri Nadi originates from north of study area (3.80 km from study area) and has a catchment area of 3.75 sq km from railway line near project site. Stream flow only for a few hours after peak rainfall events is reported in this stream at Siracha, 1.5 km NW of project site. Danesri Nadi merges into Kotdi creek area after railway crossing near project site and after this point, it has more of tidal/backwater influence than run-off from rainfall. Since no flow data is available for Danesri Nadi, a tentative estimate of run-off from Danesri Nadi catchment and discharge at railway line near project site is done based on the catchment characteristics.

The run-off values calculated for different land uses in the catchment area are presented in **Table-3**. The annual volume of surface run-off available from the catchment area is

estimated at 5.33 MCM while the volume of water available during southwest monsoon period is 5.05 MCM.

Table-3. Annual and Monsoon Run-off from Danesri Nadi Catchment

Sr.No.	Land Use	Area (sq.km)	Run-off Coefficient	Annual Rainfall (m)	Annual Run-off (MCM)	Monsoon Rainfall (m)	Monsoon Run-off (MCM)
1	Residential Land	0.68	0.50	0.432	0.15	0.410	0.14
2	Industrial Land	0.45	0.70	0.432	0.14	0.410	0.13
3	Barren Land	0.15	0.70	0.432	0.05	0.410	0.04
4	Forest Land	0.76	0.20	0.432	0.07	0.410	0.06
5	Scrub Land	5.33	0.25	0.432	0.58	0.410	0.55
6	Cultivated Land	29.99	0.30	0.432	3.89	0.410	3.68
7	Water Body	1.20	0.90	0.432	0.47	0.410	0.44
Total/average		**38.57**	**0.51**	**0.432**	**5.33**	**0.410**	**5.05**

Danesri Nadi discharge at railway crossing near project site is estimated using Rational Formula considering maximum one day rainfall of 129 mm for Mundra area. In the absence of short duration rainfall data, India Meteorological Department (IMD) empirical reduction formula has been used for estimation of 1-hour rainfall (44.72 mm/hr). Danesri Nadi peak discharge at railway crossing near project site is estimated at 256.83 cumecs which will occur only for few hours after peak rain events of magnitude mentioned above.

Rational Formula as applicable for catchments <50 sq km: Qp = 1/36(KPcA)

where Qp = Discharge in Cumecs
K = Run-off Coefficient
Pc = Critical rainfall intensity in cm/hr
A = Catchment area in ha

Qp = 1/36(0.536 x 44.72 x 3875)
= 256.83 cumecs

Danesri Nadi near Siracha

Danesri Nadi after Railway Crossing

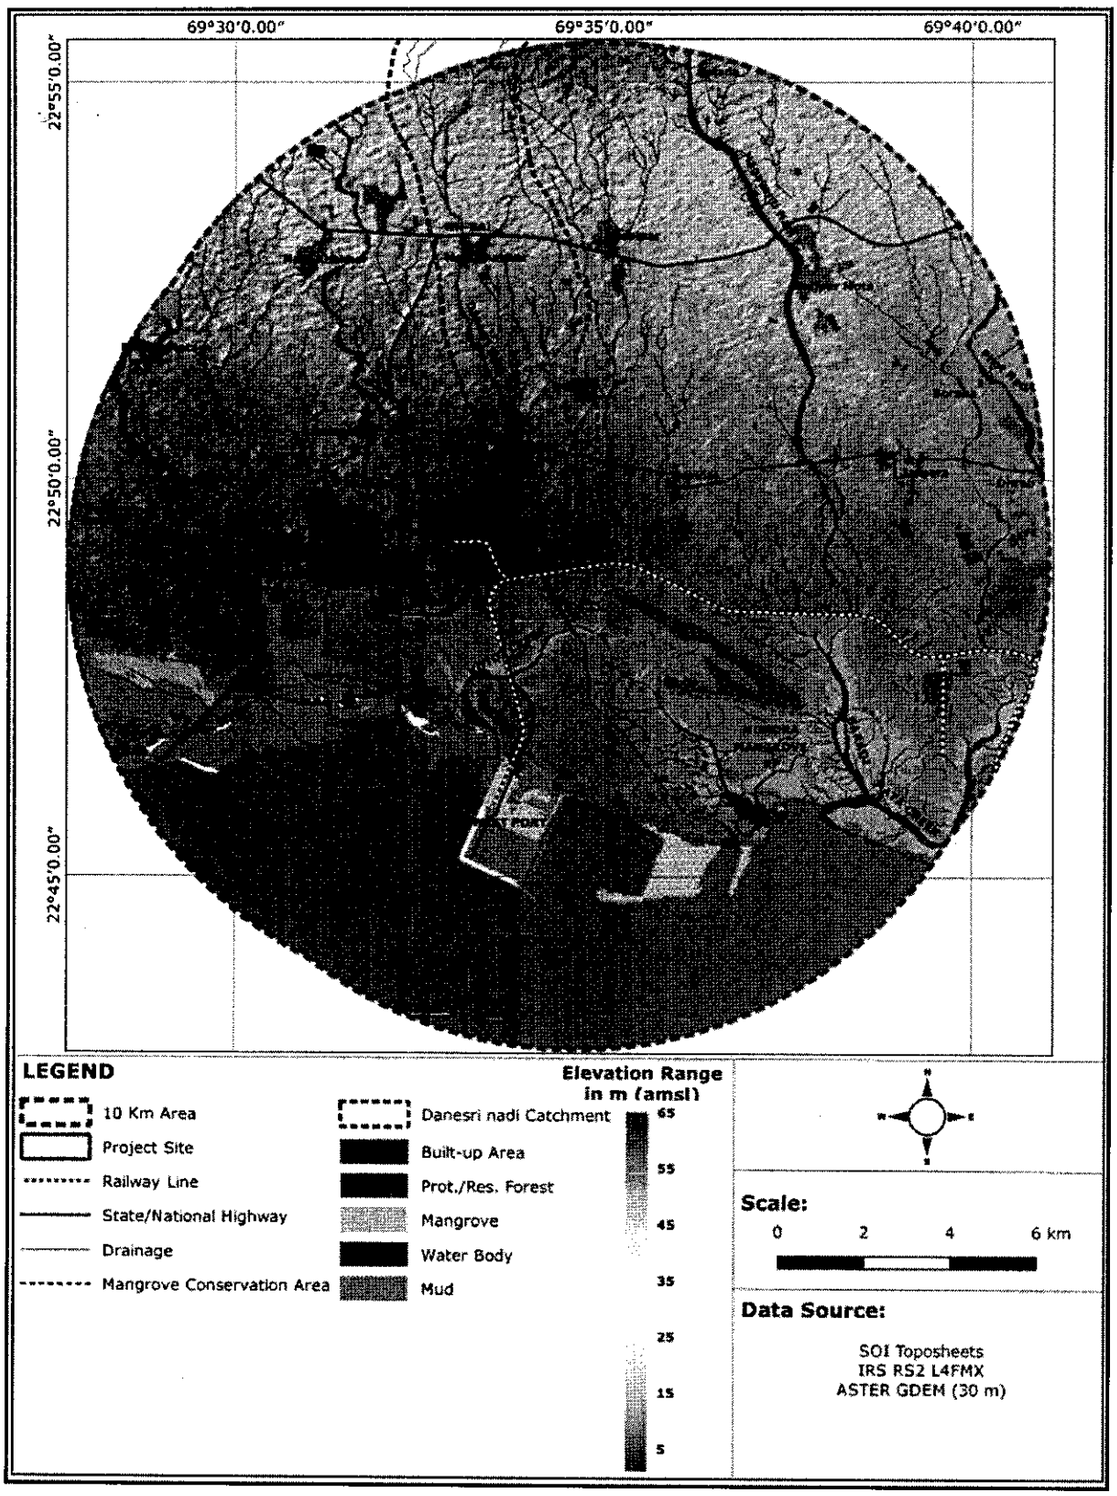

Figure-5. Physiography and Drainage Map of the Study Area

3.0 GEOLOGY

3.1 Geomorphology

Geomorphological features on earth surface craft by various geomorphic processes such as erosional, depositional, tectonic etc. Geomorphological characteristics of the region facilitate important hydrologic processes like surface run-off and infiltration. Geomorphology map of the study area has been prepared based on Geomorphology Theme (2005-06), Bhuvan, National Remote Sensing Center (NRSC) with landforms classified at Level-2 and is presented in **Figure-6**.

Geomorphologically, the study area can be divided into:

- Denudational origin
  - Pediment-Pediplain complex
- Fluvial origin
  - Younger Alluvial plain
- Coastal origin
  - Older Coastal plain
  - Younger Coastal plain
- Anthropogenic origin
  - Anthropogenic terrain
- Water bodies

The geomorphological boundaries in the study area run W-E following the coast line trend.

Pediment occurs as gently sloping rocky surface covered intermittently with weathered debris, residual gravel, wind-blown and sheet wash sand/silt deposits of variable thickness (Twidale, 1978b). Pediplain is an extensive plain formed by the coalescence of pediments. Pediment-Pediplain complex occurrence in the study area is mainly in the form of pediplain covering central to northern part.

Alluvial Plain is a largely flat landform created by the deposition of sediment over a long period of time by one or more rivers coming from highland regions, from which alluvial soil forms. Alluvial plains of the study area are compositionally sand dominant and occur along Danesri and Nagavanti nadis in the northern part.

Coastal Plain is flat, low-lying land adjacent to a sea coast. Older coastal plain extends E-W from Bhadia Nana and Jarpara between pediplain and younger coastal plain. Younger coastal plain extends E-W between younger coastal plain and Gulf of Kachchh. Proposed project site, Adani Power & other industrial set-ups in APSEZ area are located on older coastal plain.

Anthropogenic Terrain is a landform created due to human intervention. Reclaimed lands for industrial set-ups in younger coastal plain of the study area are shown as anthropogenic terrain.

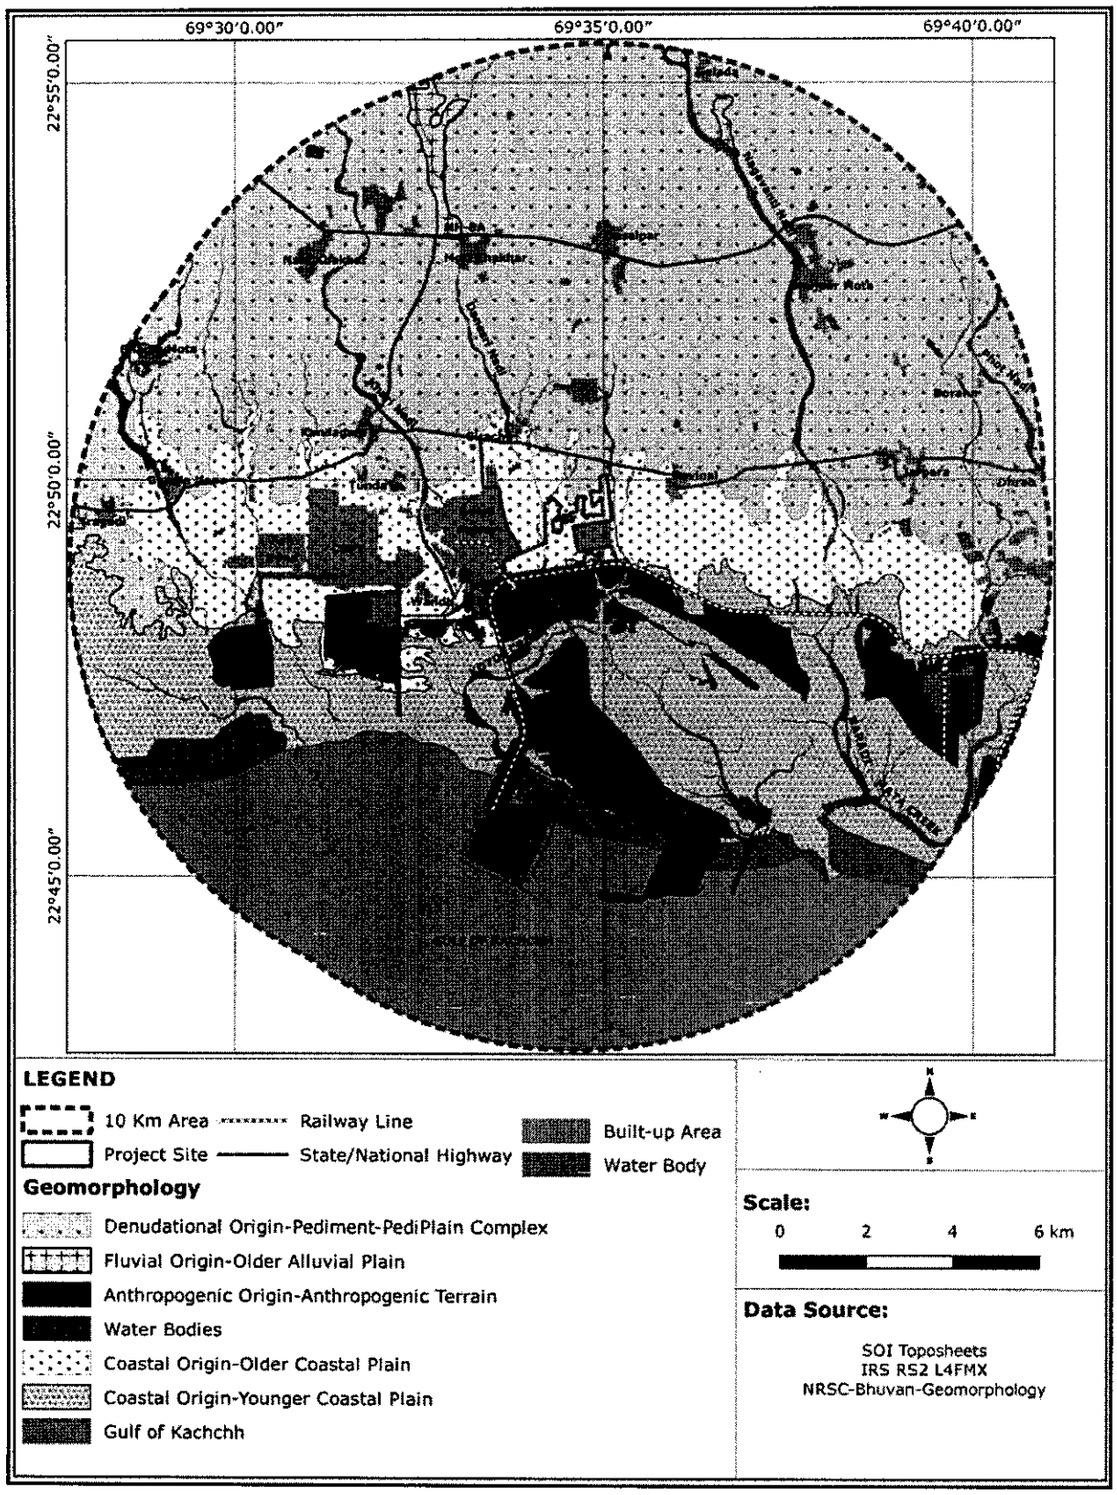

Figure-6. Geomorphology of the Study Area

Note: The older tidal flat deposits are currently inactive or no tidal activity at present in the older tidal flat deposits. Part of this area around Tragadi, Siracha, Navinal, Dhrab and Jarpara has been converted into agriculture and/plantations.

3.2 Regional Geology

The Katchchch district comprises litho-units of the Mesozoic sediments, the Deccan Volcanics, the Palaeogene and Neogene sediments of Tertiary age and the Quarternary sediments.

The Mesozoic sediments, represented by the Pachchham, the Chari, the Katrol and the Bhuj Formations, comprise mainly conglomerate, sandstone, shale, siltstone, clay, limestone, marl, etc. Various vertebrate, including dinosaurian remains (near Ler and Anjar) and footprints (near Fategarh) and invertebrate fauna and flora of Gondwana affinity are present in these sediments.

Alkaline intrusive, basaltic flows, basaltic/doleritic and olivine gabbro intrusive and andesitic trachyte represent the Deccan Volcanics. The basaltic flows, are also associated with inter-trappean horizons containing dinosaurian remains.

The Deccan Volcanics are unconformably overlain by the lateritic horizons of the Matanomadh Formation and the sedimentary rocks belonging to the Kakdinadi, the Fulra, the Maniyara Fort, the Khari Nadi, the Gaj and the Sandhan Formations. These sediments are fossilliferous and include limestone, shale, siltstone, marl, sandstone, conglomerate, etc.

The Pleistocene sediments include coarse clastics of the Kothara Formation and predominantly calcareous rocks of the Miliolite Formation.

The youngest sediments belong to the Holocene period and are represented by the Rann Clay and Mahuva Formations (marine), Rann Formation (fluvio-marine), Katrol and Varahi Formations (fluvial) and Jantral Formation (Aeolian).

The regional stratigraphic succession based on Geological Survey of India (GSI) publication, 2000 is given in **Table-4**.

Table-4. Regional Stratigraphic Succession

Lithology	Formation	Group/Series	Age
Younger tidal flat and marsh deposits	Mahuva Formation (ME)		Holocene
Older tidal flat and marsh deposits	Rann Clay Formation (ME)		
Rann clay and mud deposits	Rann Formation (FME)		
Younger flood plain, channel-fill and deltaic deposits	Varahi Formation (FE)		
Older flood plain and channel-fill deposits	Katpur Formation (FE)		
Un-stabilized sand sheet and sand dune deposits	Jantral Formation (AE)		

Lithology	Formation	Group/Series	Age
Miliolite limestone, shell limestone, calcareous sandstone, pebbly limestone and conglomerate	Miliolite Formation	Porbander Group	Lower Pleistocene
Pebbly sandstone, conglomerate gravel and sand	Kothara Formation		Lower Pleistocene
Micaceous sandstone, mottled clay, siltstone, conglomerate and calcareous clay and marl	Sandhan Formation		Pliocene
Shale interbedded with fossilliferous marl	Gaj Formation		Lower to Middle Miocene
Variegated siltstone and gypseous claystone	Khari Nadi Formation		Upper Oligocene to Lower Miocene
Calcareous and gypseous claystone/siltstone, clay, coral limestone and sandstone	Maniyara Fort Formation		Middle to Upper Oligocene
Foraminiferal limestone, glauconitic shale and clay	Fulra Formation		Middle Eocene
Gypseous, lignite-bearing shale, fossilliferous nodular limestone and clay, ferruginous shale and clay with intercalated marl	Kakdi Nadi Formation		Lower Eocene
Laterite, sandstone, conglomerate and bentonitic and kaolinitic clay	Matanomadh Formation		Palaeocene
Andesitic trachyte	Extrusive	Deccan Volcanics	Upper Cretaceous to Eocene
Olivine gabbro	Intrusive		
a. Basalt and dolerite dyke, b. Plug and sill			
Basalt flows with inter-trappean sediments	Extrusive		
a. Alkali gabbro, b. Alkali basalt			
Gluconitic and burrowed sandstone, siltstone, shale, limestone, marl, conglomerate, ironstone and clay with marine and plant fossil	Bhuj Formation		Cretaceous
Shale, fossilliferous sandstone, marl and conglomerate	Katrol Formation		Upper Jurassic to Lower Cretaceous
Gypseous shale, siltstone and conglomerate with phosphatic nodule, colitic limestone	Chari Formation		Middle to Upper Jurassic
Gypseous shale, siltstone, limestone, sandstone and conglomerate	Pachchham Formation		Middle Jurassic

(Source: GSI Publication, 2000)

3.3 Geology of the Study Area

Of the total study area of 413.68 sq km, 75.67 sq km (18.29%) of the southern part is covered by Arabian Sea, the Gulf of Kachchh. Remaining study area is entirely occupied by Holocene/Quarternary sediments with surface lithological boundaries running almost parallel to coast line (E-W).

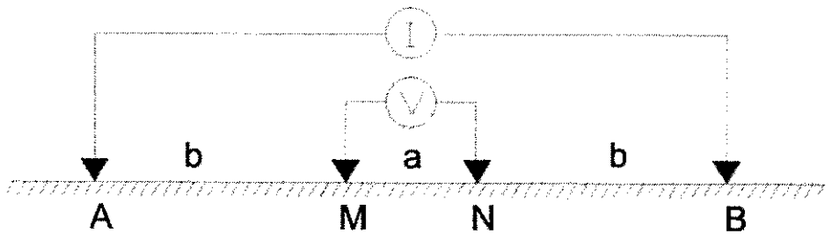
Holocene sediments of the study area comprises of younger and older tidal flat and marsh deposits of Mhuva and Rann Clay Formations respectively from sea towards inland and younger flood plain, channel-fill and deltaic deposits from tidal flats towards inland. The tidal flat and marsh deposits occupy 41.31% of the study area covering170.88 sq km. Flood plains belonging to Varahi Formation extend from central to northern part of the study area covering 161.48 sq km (39.03%). Coastal region also has aeolian sands deposited under strong wind action from gulf occupying a small area 5.65 sq km (1.37%).

Recent flood plain sediments are deposited by rivers flowing southerly and ultimately meet to Gulf of Kachchh in south. Alluvium sediments composed of sand, gravel, beach sand, dunal sand and tidal mud. The thickness of alluvium is observed to be 2.0 m in the north to 18.0 m. The recent sediments are well exposed in cliff sections of Danesri, Nagavanti and Phot nadis. Alluvium is highly porous in nature and is a good aquifer of coastal region.

Geology of the study area based on GSI publication, 2000 is presented in **Figure-7**.

3.4 Sub-Surface Lithology and Resistivities in the Study Area

3.4.1 Sub-Surface Lithology



Sub-surface lithological information collected from the local tube well driller for two tube well locations in Bhujpur and Siracha is presented in the form of lithologs in **Figure-8**. Top soil at these locations is reported to be around 2.00 m followed by alluvium extending up to 15.00 m. At Bhujpur, alluvium is underlain by compact sandstone and disintegrated sandstone occurring as alternate layers up to 182.00 m with lateritic gravel between 61.00 m and 76.00 m. Disintegrated/fractured sandstone from 122.00 m to the bottom of the well is water yielding acting as aquifer. At Siracha, alluvium is followed by calcareous kankar up to a depth of 30.00 m. Below this, compact sandstone and disintegrated sandstone occur as alternate layers up to 122.00 m. Disintegrated/fractured sandstone from 107.00 m to the bottom of the well is water yielding and acting as aquifer.

3.4.2 Sub-Surface Resistivities

Application of geophysical methods will help us to identify the nature and thickness of sub-surface formation by studying the variation of their physical properties through the measurements made at the surface. Several surface geophysical methods are deployed to reach the purpose. All these methods rely upon the principle that each lithological assemblage has independent physical properties and identification of these properties helps to recognize the formation. One such property easily detectable is its electrical character for the passage of known strength of current. These testing methods are applied for arriving information on sub-surface lithological data and vertical layering of water structure in the surveyed area.

In geo-electrical methods, the centre of the configuration (O) is kept at fixed location and measurements are made by successively increasing electrode spacing. In this, current is sent into the ground through a pair of electrodes called current electrodes and resulting potential difference across the ground is measures with the help of another pair of electrodes called potential electrodes. The ratio between the potential difference (ΔV) and current (I) gives the resistance (R), which depends on the electrode arrangement and on the resistivity of the sub-surface formations. The apparent resistivity values obtained with increasing values of electrode separations are used to estimate the thickness and resistivity of the sub-surface formations. The plot between apparent resistivity values obtained with increasing values of electrode separations and corresponding current electrodes separation from the centre is used for analysis of thickness and true resistivity of the sub-surface formations.

There are two popular surface electrical methods in geophysical investigations namely Schlumberger and Werner configurations. The Schlumberger method of Electrical Resistivity Test (ERT) was used in the present study with the help of a DC resistivity meter - DDR-3 of IGIS, Hyderabad. In Schlumberger configuration, all the four electrodes (A, B, M and N) are kept in a line. The outer electrode spacing (b) is kept large, compared to the inner electrode spacing (a), usually more than 5 times. Field resistance values will be obtained at every change of electrode spacing for calculating apparent resistivity values. The disposition of electrodes for Schlumberger configuration is shown in below picture and the apparent resistivity ρ_a for a specified configuration is computed with below mentioned formula.

Schlumberger Configuration

Apparent Resistivity $\rho_a = \pi kR$

where, 'k' is the constant = $\pi/a(AB/2^2-MN/2^2)$
'AB' is current electrode spacing and
'MN' is potential electrode spacing
$R = \Delta V/I$

For obtaining the thickness and true resistivity of sub-surface lithological units within the study area, Electrical Resistivity Tests (ERTs) were conducted at 15 different locations following Schlumberger configuration with a maximum AB/2 separation of 100.5 m. The DC resistivity meter model DDR-3 of IGIS, Hyderabad make is used in the present geophysical investigations. Locations for conducting ERTs were selected considering topography & space to run electrodes up to 100 m on either side, site conditions including surface moisture etc.

Out of these, 2 ERT locations were within the project site and rest are spread in the study area. These locations are designated as ERT1 to ERT15 and shown in **Figure-7**.

At ERT1, 2, 5, 6, 7, 10, 12, 13, 14 and 15, field data could not be captured for the complete AB/2 separation of 100.5 m even after several attempts and the data capture at these locations ranged from 21.0 m to 59.0 m. The following reasons may be attributed for not capturing data beyond mentioned AB/2 separation at these locations:

- The layers present below respective depths having very low resistivity values <1Ωm
- The layers are highly altered or highly brackish or saline

The resistivity data obtained is interpreted in terms of physical parameters viz., resistivity and thickness of the formations. In the present study, Inverse Slope method of interpretation is used to interpret the data acquired from the field. Resistivity and thickness of each layer at 15 locations are presented in **Table-5**.

Resistivities of different lighological units in the study area range from <1 Ωm to >300 Ωm. ERT1 and 2 are located in project site lying on older tidal flat and marsh deposit with resistivities ranging from <1.0 Ωm to 5.0 m. The resistivity at these locations decreases to <1.0 Ωm with depth indicating saline nature. The other sub-surface lithological units in the study area represent alluvium of fluvial origin, laterite as capping and extending as lens into sandstone and sandstone with resistivities ranging between 5.0 Ωm to >300 Ωm. At ERT5, 6, 7, 10, 12, 13, 14 and 15 also, resistivity below 21.0 m to 59.0 m is very low <1.0 Ωm indicating formation salinity.

Table-5. Resistivity and Thickness Details from Electrical Resistivity Tests (ERTs)

A review of soil analysis results indicates that the soils in the proposed project site are of clay loam type with slow permeability, high water holding capacity, 1.1 g/cc of bulk density and saline in nature. The project proponent is advised to take up detailed geo-technical investigations to further gaining an engineering decision on foundation and construction of buildings.

3.5 Tectonic Setup and Lineaments/Faults

The Kachchh district lies 3-400 km from the plate boundary between the Indian Plate and the Eurasian Plate, but the current tectonics is still governed by the effects of the continuing continental collision along this boundary. During the break-up of Gondwana in the Jurassic, this area was affected by rifting with a roughly west-east trend. During the collision with Eurasia the area has undergone shortening, involving both reactivation of the original rift faults and development of new low-angle thrust faults. The related folding has formed a series of ranges, particularly in central Kachchh.

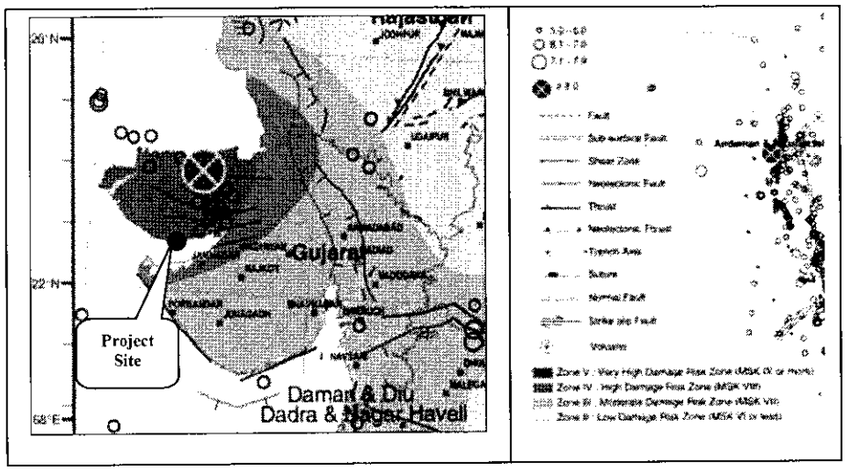
Kachchh geological province, Gujarat is often referred to as "Kachchh Basin", "Kachchh Rift Basin" or "Kachchh Aulacogen", in tune with the usage by workers involved in the exploration of oil in the terrain. The Kachchh basin is bounded between the Nagar Parkar Fault (NPF) in the north and North Kathiawar Fault towards south.

(Source: Current Science, Vol 112, No.5, 10 Mar 2017)

The study area form part of Kachchh Basin and does not show any major tectonic evidences except few geomorphic lineaments parallel to drainage courses and a minor fault of structural origin in the SE (**Figure-7**). The nearest major fault is North Kathiawar Fault (NPF) towards south.

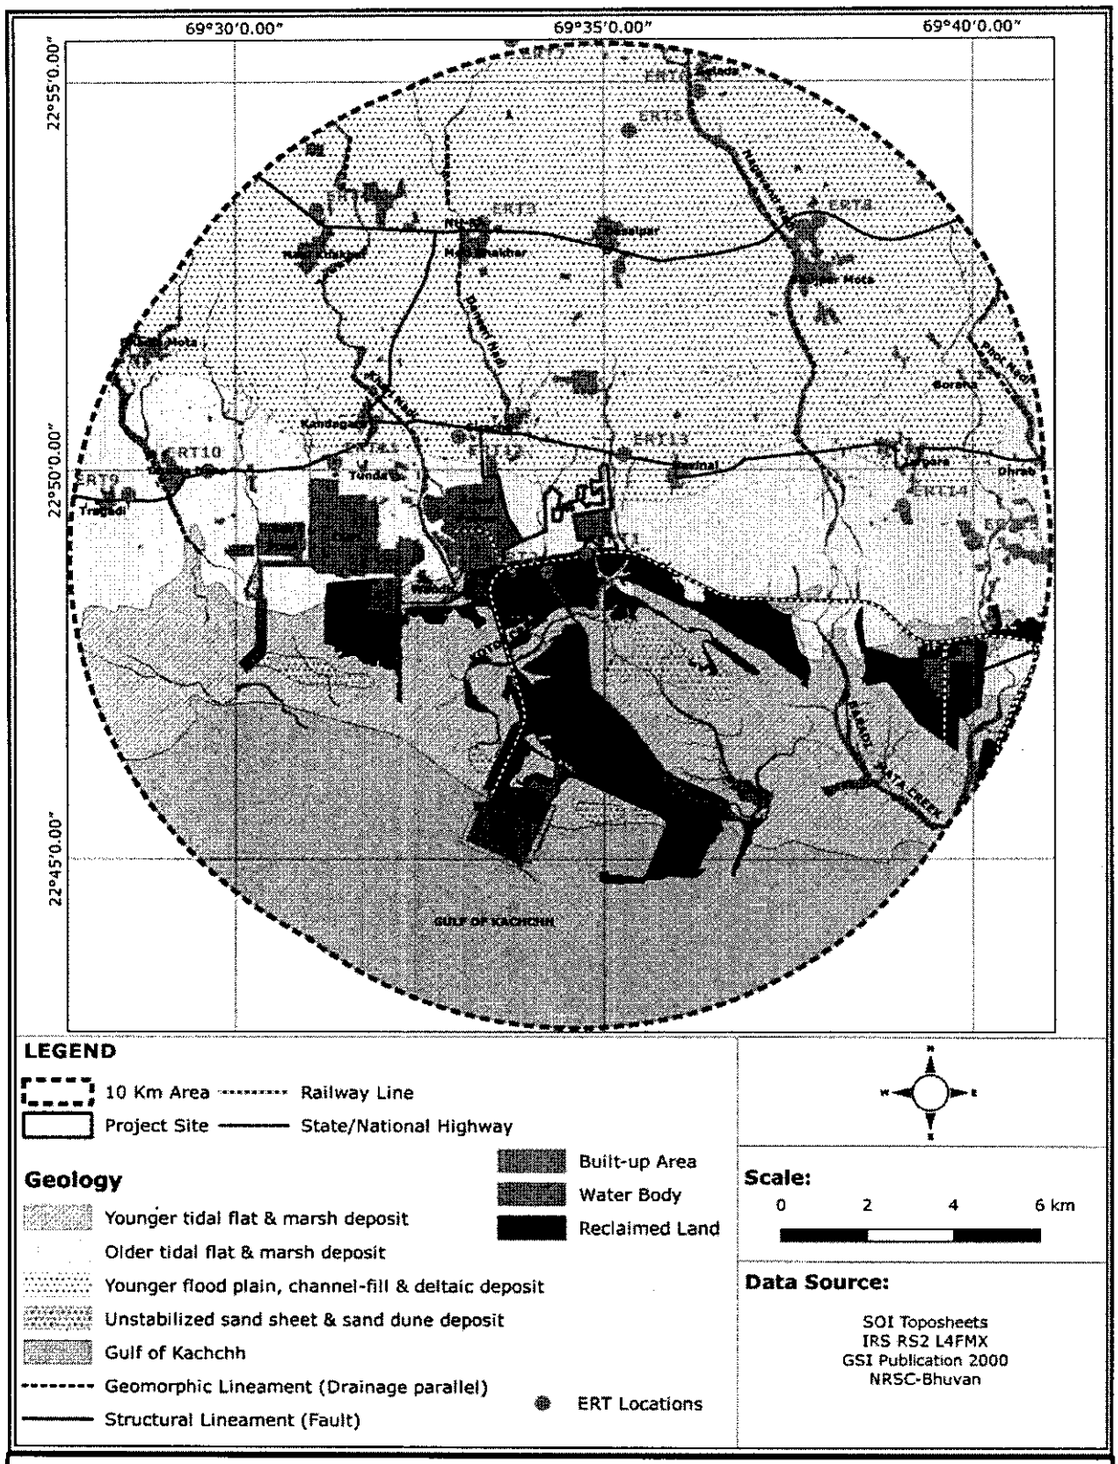
hazards and the physical, social and economic vulnerability of its people, asses and economy at taluka level. The estimated mean taluka Peak Ground Acceleration (PGA in g) zonation with event magnitude for a 100 year return period is presented in **Figure-9**. This zonation would typically be used for the design of critical buildings that need to have a mean design service life of 100 years.

The cities of Ahmedabad, Baruch, Rajkot and Bhavnagar fall into the severe intensity zone, while Bhuj and Jamnagar fall in the very severe intensity zone over this time frame. The project site is located in unclassified zone covering Little and Great Rann of Kachchh including Mundra coastal area, but close to very severe intensity zone.



3478 3180

3.6 Earthquakes



The Indian subcontinent has a history of devastating earthquakes. The major reason for the high frequency and intensity of the earthquakes is that the Indian plate is driving into Asia at a rate of approximately 47 mm/year. Geographical statistics of India show that almost 54% of the land is vulnerable to earthquakes. The latest version seismic zoning map of India given in the earthquake resistant design code of India (IS 193 (Part 2) 2002) assigns four levels seismicity for India in terms of zone factors. In other words, the earthquake zoning map of India divides India into 4 seismic zones (Zone 2, 3, 4 and 5) unlike its previous version, which consisted of five or six zones for the country. According to the present zoning map, Zone 5 expects the highest-level seismicity whereas Zone 2 is associated with the lowest level of seismicity. The MSK (Medvedev-Sponheuer-Karnik) intensity broadly associated with the various seismic zones is VI (or less), VII, VIII and IX (and above) for Zone 2, 3, 4 and 5 respectively, corresponding to Maximum Considered Earthquake (MCE). Each zone indicates the effects of an earthquake at a particular place based on the observations of the affected areas and can also be described using a descriptive scale like Modified Mecalli Intensity Scale or the Medvedev-Sponheuer-KarnikSclae.

Earthquake risk is very high in Gujarat and the state has suffered major earthquakes in 1819, 1845, 1847, 1848, 1864, 1903, 1938, 1956 and 2001 (9 times in past 200 years). The 2001 Kachchh earthquake also known as Bhuj earthquake was the third largest and second most destructive earthquake in India over the last two centuries. The epicentre was about 9 km south-southwest of the village Chobari in Bachau taluka of Kachchh district. The intraplate earthquake reached 7.7 on the moment magnitude scale.

As per Earthquake Hazard Map of India, Building Material and Technology Promotion Council (BMTPC) prepared based on digitized data of SOI, GOI; Seismic Zones of India Map IS:1893-2002, BIS, GOI; Seismotectonic Atlas of India and its Environs, GSI, GOI, the study area falls in Very High Damage Risk Zone – Zone V (MSK IX or more).

In order to provide a guiding framework to undertake mitigation investments and activities, Gujarat State Disaster Management Authority (GSDMA) initiated a study for preparation of a Composite Hazard Risk & Vulnerability Atlas for the state covering six natural and man-made

Note: The older tidal flat deposits are currently inactive or no tidal activity at present in the older tidal flat deposits. Part of this area around Tragadi, Siracha, Navinal, Dhrab and Jarpara has been converted into agriculture and/plantations.

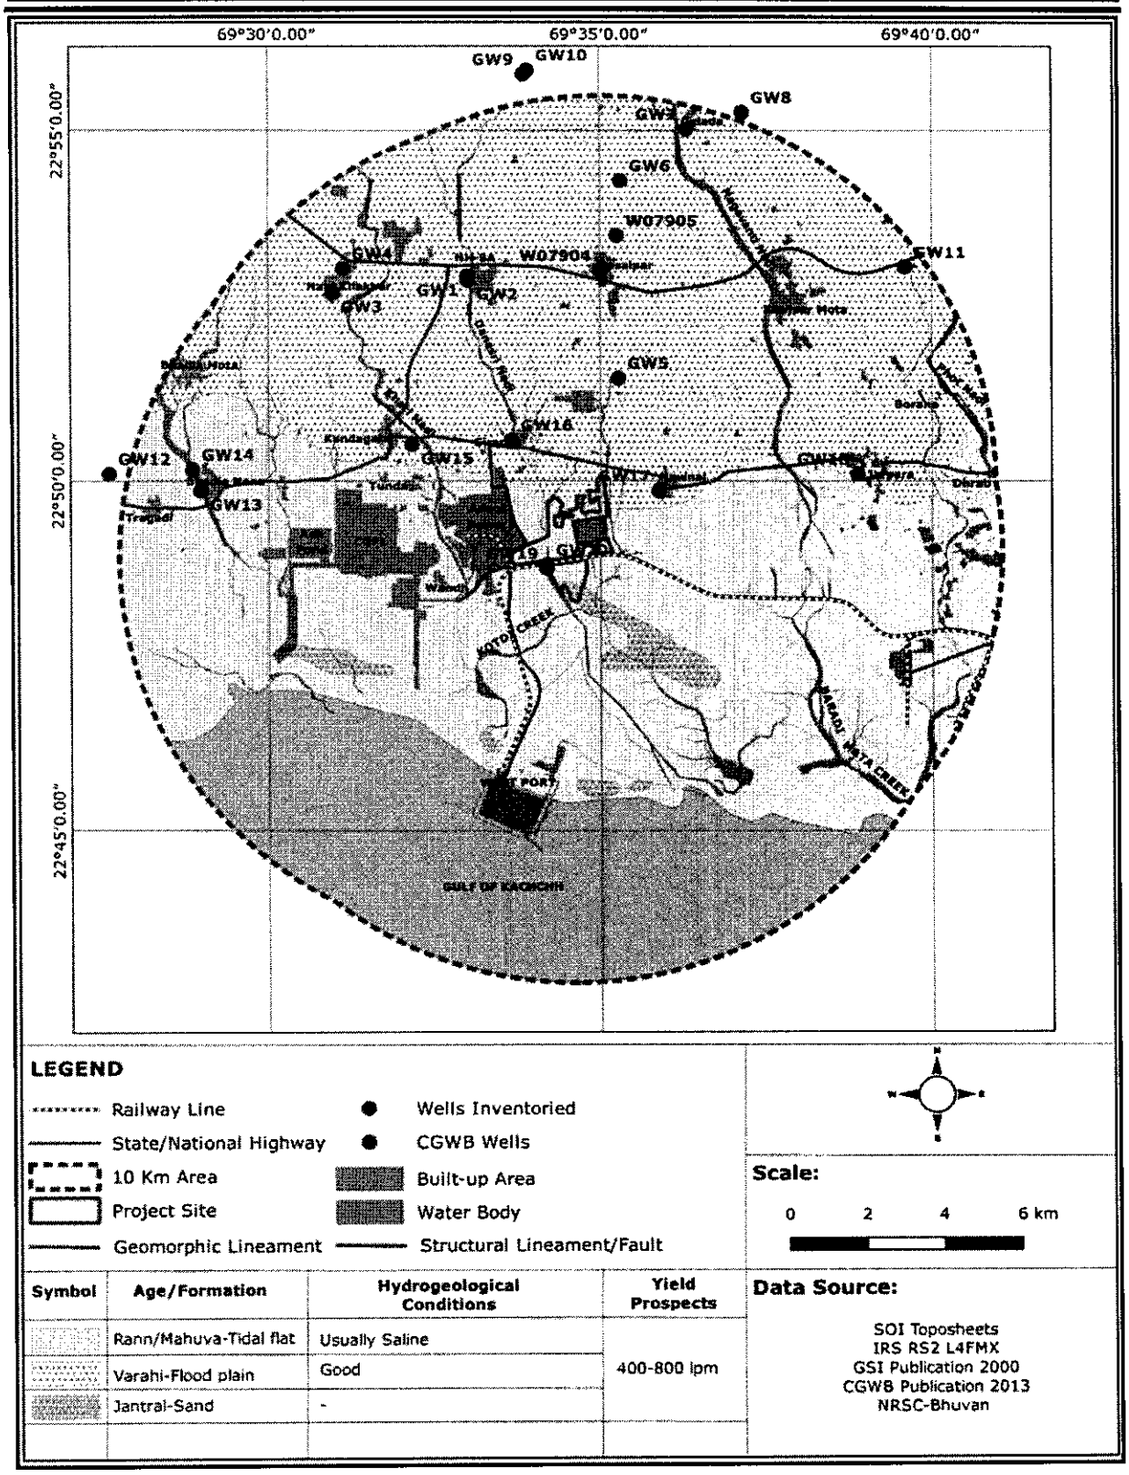
4.0 HYDROGEOLOGY

Hydrogeology is the area of geology that deals with the distribution and movement of ground water in the soil and rocks of earth's crust commonly in aquifers. The hydrogeological studies have been carried out in the area to understand the local geology, geo-morphological features, drainage network, aquifer characteristics and yield of water. Accordingly, various components controlling the hydrogeological regime of the study area have been studied. Hydrogeological investigations were carried out in the area between 06.02.2019 and 08.02.2019. Hydrogeology of the study area is presented in **Figure-10**.

4.1 Nature of Occurrence of Ground Water

Ground water systems are a result of the complex combination of different lithological and structural types within an area that together constitute an aquifer within which ground water accumulates and moves. Rather than describing individual lithologies and their tendencies to form aquifers or otherwise, it is useful to describe the ground water as **one continuous across** various lithological types (Kulkarni and Deolankar, 1995).



Of the total study area of 413.68 sq km, 75.67 sq km (18.29%) of the southern part is covered by Arabian Sea, the Gulf of Kachchh. Remaining study area is entirely occupied by Holocene/Quarternary sediments with surface lithological boundaries running almost parallel to coast line (E-W).

Holocene sediments of the study area comprises of younger and older tidal flat and marsh deposits of Mhuva and Rann Clay Formations respectively from sea towards inland and younger flood plain, channel-fill and deltaic deposits from tidal flats towards inland.

The thickness of alluvium is observed to be 2.0 m in the north to 18.0 m and tidal flat and marsh deposits are more than 20 m in thickness. The alluvium is underlain by sandstone of Sandhan Formation and laterite at places. Sandstone forms productive aquifer at places. The alluvium yields small quantities of brackish water to shallow wells.

4.2 Wells, Water Levels and Yields

Ground water in the study area is developed through shallow dug wells and tube wells for domestic, irrigation and industrial purpose. Dug wells are mainly seen along and in the stream courses and near water bodies/check dams. With the increase of tube wells in the area and lowering of water table, most of the dug wells are abandoned. Only a few dug wells near water bodies/check dams have water during the field visit. Depth of dug wells inventoried range from 7.58 m to 16.90 m below ground level (bgl) and of tube wells range from 54.86 m to 137.16 m bgl. Depth of tube wells in the study area range from 30.00 m to 180.00 m bgl with a diameter of 12". 46% of the dug wells inventoried are dry during the field visit. Of the total dug wells inventoried only two wells are being used for domestic purpose and rest of the wells are not being used. Tube wells are used for both domestic in the villages and for agriculture in the fields installing 3.5 HP to 20 HP submersible pumps.

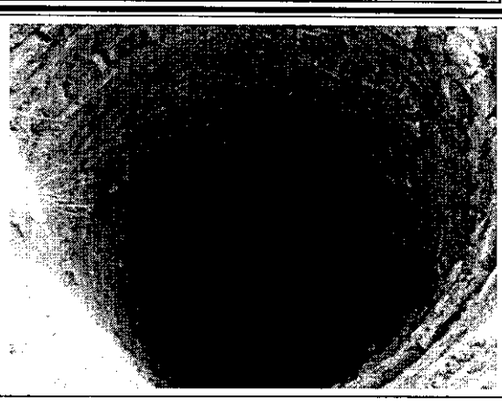
Symbol	Age/Formation	Hydrogeological Conditions	Yield Prospects
	Rann/Mahuva-Tidal flat	Usually Saline	400-800 lpm
	Varahi-Flood plain	Good	
	Jantral-Sand	-	

Figure-10. Hydrogeology of the Study Area

Note: The older tidal flat deposits are currently inactive or no tidal activity at present in the older tidal flat deposits. Major portion of this is turned to be waste land mainly with prosopis/thorny shrub and existing industrial set-ups in Adani SEZ are located in this area. Part of this area around Tragadi, Siracha, Navinal, Dhrab and Jarpara has been converted into agriculture land/plantations.

Water levels during field visit are recorded measuring depth to standing water and post monsoon water levels are recorded up to the moisture indication in the dug wells. Pre monsoon water levels are recorded through interaction with well owner or local person available at the site. The depth to water level in dug wells during field visit (2nd week of February 2019) ranges from 7.85 m to 16.12 m bgl whereas the depth to water level in tube wells ranges from 2.00 m bgl in Adani piezometers near project site to 44.38 m bgl in an agricultural well near Gelada. Of the total dug wells inventoried, all wells except three in Depa and Navinal are reported to go dry during summer. Pre monsoon water levels in the three wells range from 10.00 m to 14.20 m bgl. The depth to water level in dug wells during post monsoon ranges from 3.25 m bgl in Depa to 9.80 m bgl in NaniKhakhar. The average water levels in dug wells during field visit, pre and post monsoon are 12.42 m, 12.13 m and 6.23 m bgl respectively with a water level fluctuation of 7.15 m. Well inventory data is furnished in **Table-6**.

Two to 10 tube wells for domestic use and village water supply and 50 to 300 tube wells for agriculture purpose are reported to be drilled in each village depending on village size and about 30% of these were reported as low or no yielding. Yields from tube wells in the study area range from <75 m^3/day (<1 lps) to around 2000 m^3/day (around 20 lps).



There were two dug wells in Deshalpur under CGWB water level monitoring network (Well Code: W07904 & W07905) and these wells were monitored till 2001. Pre and post monsoon average water levels in these wells between 1996 and 2001 are17.13 m and 0.52 m respectively. Water level monitoring data of these wells is presented hereunder:

4.3 Movement of Ground Water

Ground water movement mainly takes place through the fractures and joints of the crystalline rocks and the ground water is transmitted through voids and interstitial openings in sedimentary rocks and unconsolidated formations. In other words, movement of ground water is controlled by the hydraulic conductivity of the aquifer and hydraulic gradient.

Based on the water level data during field visit, ground water level contour map has been prepared for February 2019 considering water levels reduced to mean sea level and presented in **Figure-11**. The reduced water levels in the study area range from 41.00 m

above mean sea level (amsl) in the north to -22.00 m below mean sea level (bmsl) between Bhadia Mota and Bhadia Nana in the west. General ground water flow direction in major part of the study area is towards Gulf of Kachchh with depressions of deeper levels below mean sea level between Bhadia Mota and Bhadia Nana, around Navinal and east of Bhujpar Mota. These ground water depressions indicate either ground water pumping in these areas is heavy and/or piezometric head of the aquifer is not reaching the general water table.

Reduced water levels <0 around Bhadia Mota, Bhadia Nana, Tragadi, CGPL and Wandh in the west and to the east of Bhujpar Mota in the northeast indicate that ground water movement is towards inland encouraging sea water intrusion. The hydraulic gradient in the study area ranges from 3.33 m/km towards project site from upstream to 6.26 m/km in the northeast.

4.4 Aquifer Characteristics

Ground water is stored in the open spaces and fractures within geologic material such as soil, sand and rock that occur beneath the land surface. Aquifers are the geologic layers that are filled with water and that can transmit enough water to supply a well under normal hydraulic gradients.

Pumping tests are conducted to determine the performance characteristics of a well and to determine the hydraulic properties of the aquifer such as permeability/hydraulic conductivity, transmissivity and storage coefficient. Permeability is the ease with which water can flow in a soil mass or a rock. These properties determine how easily water moves through the aquifer, how much water is stored, and how efficiently it produces water. During an aquifer test, the hydraulic head in the aquifer declines as the time of pumping increases. Analysis of hydraulic head decline, or drawdown, allows for the estimation of aquifer hydraulic properties. There are many pumping test solution methods but most commonly used for different aquifers and conditions have some general assumptions: a) aquifer extends radially and infinitely, b) single pumping well, c) fully penetrating well (except for Neuman method).

A medium duration test was conducted on a bore well in Navinal on 07.02.2019 and corresponding drawdown measurements were done on the pumping well. The bore well is 91.44 m deep with a discharge of 4.2 lps. The pump test was conducted for 300 minutes till steady state condition was achieved. After stopping the pump, recovery was continued for 100 minutes. In the absence of observation well, interpretation of single well tests with Cooper-Jacob straight line method remains more reasonable than most alternatives. The aquifer parameters were determined using Cooper-Jacob straight line method for pumping and Theis Recovery method for recovery data.

Pumping and recovery data are presented in **Table-7** and **Table-8** respectively and flows are shown in **Figure-12**. The results of pumping and recovery analysis are presented in **Table-9**. The average transmissivity is found as 54.75 m^2/day while storage coefficient is 8.93E-03 and hydraulic conductivity is found as 5.475 m/day. Aquifer characteristics in the region as summarized from different studies are presented in **Table-10**.

5.0 GROUND WATER RESOURCES

5.1 Ground Water Recharge

Ground water recharge or deep drainage or deep percolation is a hydraulic process where water moves downward from surface water to ground water. Recharge is the primary method through which water enters an aquifer. This process usually occurs in the vadose zone below plant roots and is often expressed as a flux to the water table surface. Recharge occurs both naturally through the water cycle (rainfall) and through anthropogenic processes (artificial ground water recharge), where rain water and or reclaimed water is routed to the sub-surface. Most of the rainfall flows downstream as run-off and the amount of rainfall reaching ground water naturally after meeting evaporation and evapo-transpiration losses is very limited. The anthropogenic processes of ground water recharge in the study area include return flow from irrigation, check dams etc.

Of the total study area of 413.68 sq km, 75.67 sq km (18.29%) of the southern part is covered by Arabian Sea, the Gulf of Kachchh. Remaining study area is entirely occupied by Holocene/Quarternary sediments with surface lithological boundaries running almost parallel to coast line (E-W).

Holocene sediments of the study area comprise of younger and older tidal flat and marsh deposits of Mhuva and Rann Clay Formations respectively from sea towards inland and younger flood plain, channel-fill and deltaic deposits from tidal flats towards inland.

Since most of the ground water abstraction is in alluvial deposits, only 161.48 sq km of flood plain area has been considered to estimate the ground water recharge. Recharge in the study area has been worked out by rainfall infiltration and increment in ground water storage methods as per the guidelines of Ground Water Estimation Committee (GEC), 1997 and details are presented in **Table-11** and **12**respectively. Recharge by rainfall infiltration is estimated considering average rainfall of IMD, Mundra and Mandvi and rainfall infiltration factors of geological units in the study area. The average ground water fluctuation in dug wells between pre and post monsoon in the study area has been considered to estimate recharge by increment in ground water storage.

Table-11. Recharge by Rainfall Infiltration

Sr.No.	Recharge Unit	Area (sq.km)	Rainfall Infiltration	Annual Rainfall (m)	Recharge (MCM)
1	Younger flood plain, channel-fill & deltaic deposit	161.48	0.10	0.43	6.98
2	Recharge from return flow (irrigated + aquaculture)	40.59	0.25	0.43	4.39
3	Water Body	11.57	0.20	0.43	1.00
Total Ground water recharge					12.37

Table-12. Recharge by Increment in Ground Water Storage

Sr.No.	Recharge Unit	Area (sq.km)	Specific yield	Increment in groundwater storage (fluctuation) (m)	Recharge (MCM)
1	Younger flood plain, channel-fill & deltaic deposit	161.48	0.120	7.15	138.55
2	Recharge from return flow	40.59	0.250	0.43	4.39
3	Water Body	11.57	0.200	0.43	1.00
Total Ground water recharge					**143.94**

The average ground water recharge by rainfall infiltration and increment in ground water storage is 78.15 MCM. However, the huge difference in recharge by rainfall infiltration and increment in ground water storage indicate that the ground water draft is much more than ground water recharge.

5.2 Ground Water Discharge

The ground water discharge in the study area is mainly for domestic and irrigation purposes. The annual ground water draft has been estimated as per GEC 97 guidelines and is given in **Table-13**.

Wheat, bajra, millets and **pulses** are the major food crops, while **cotton, castor** and **groundnut** are the major commercial crops grown in the area. Mango, **papaya, Date Palm**, Sapota, Lemon and **Pomegranate** are the important horticultural crops. While wheat and cotton are most water intensive crops, water requirement for other crops and plantations is less. As the area receives very low rainfall, no canal irrigation facilities (Narmada Canal running across north central part of study area is under construction), deep water levels resulting in dry open wells, the local agriculture is dependent on only tube wells for irrigating the crops and plantations.

The total ground water draft for different purposes in the study area is 11.40 MCM.

Table-13. Annual Ground Water Draft/Discharge

Sr.No.	Purpose	Usage in Days	Requirement/Usage m^3/day	No. of Units	Ground water draft (MCM)
1	Domestic human population and livestock	365	0.075	60525	1.66
2	Irrigation	120	40 (per ha)	2030	9.74
4	Existing Industries	365	0	0	0.00
Total groundwater draft					**11.40**

5.3 Ground Water Balance

Ground water balance in respect of the study area has been estimated as per GEC 97 guidelines and is indicated in **Table-14**. Ground water balance flow diagram is placed as **Figure-13**. As per GEC 97 norms, areas where ground water resources assessment shows stage of ground water development at 70% or lower and there is no significant long term decline of pre or post monsoon ground water levels are categorized as "Safe" areas with potential for development; more than 70%, but less than 90% and either pre or post monsoon ground water level shows a significant long term decline are categorized as "Semi Critical" areas with cautious ground water development; more than 90% but less than 100% are categorized as "Critical"; more than 100% are categorized as "Over-exploited".

The study area forms part of Mundra and Mandvi blocks of Kachchh district. The average stage of ground water development in these blocks as per CGWB assessment is 82.26% and categorized as "Semi-critical" (Mundra at 63.28% as "Safe" and Mandvi at 101.23% as "Over-exploited").

The following factors of the study area make it difficult to arrive at a reasonable water balance:

- The study area has a complex geological setup with 59% of the under Gulf of Kachchh and tidal flat and marsh deposits;
- Very low rainfall, meagre natural recharge and higher ground water draft
- The study area covers 10 km radius area from the project site and not defined as a hydrological unit (watershed or catchment);
- Non availability of exact information on ground water draft through tube wells or number of tube wells; etc.,

However, an attempt has been made to arrive at a water balance for the study area based on available information. The present stage of ground water development in the study area is estimated as 102.37% and can be categorized as "Over-exploited".

Table-14. Ground Water Balance

Sr.No.	Particulars	Quantity (MCM)
I	Gross groundwater recharge	12.37
ii	Natural discharge to drain and other losses – 10% of (i)	1.24
Iii	Net groundwater availability (i-ii)	11.13
iv	Annual groundwater draft for all uses	11.40
v	**Groundwater balance (iii-iv)**	**-0.26**
vi	Water requirement for the proposed project	0.00
Vii	Balance of groundwater left for development	-0.26
[illegible]	[illegible]	102.37
iX	Present stage of groundwater development in Mundra & Mandvi blocks as per CGWB District Profiles	82.26% (Semi-critical)
X	Stage of ground water development in the study area	102.37

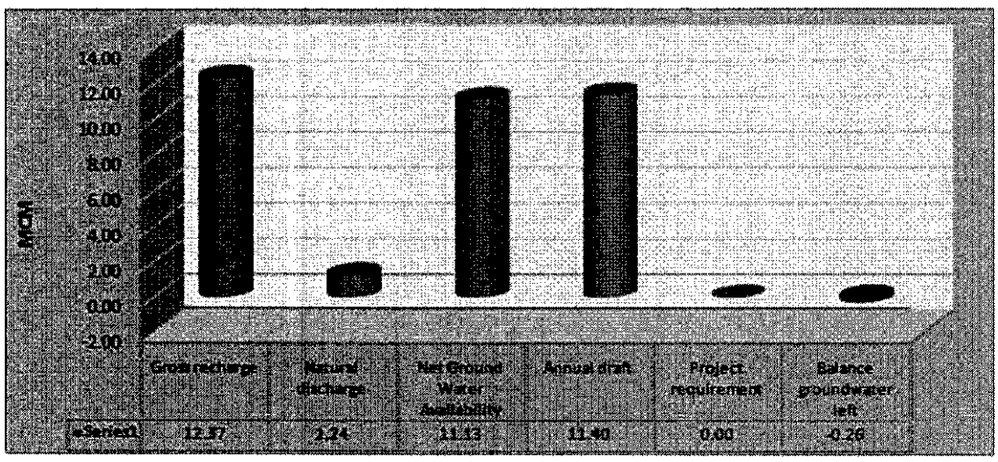

Figure-13. Ground water Balance in Study Area

6.0 WATER QUALITY

For any water body to function adequately in satisfying the desired use, it must have corresponding degree of purity. Drinking water should be of highest purity. As the magnitude of demand for water is fast approaching the availability supply, the concept of management of the quality of water is becoming as important as its quantity. Each water use has specific quality need. IS 2296:1992 specifies surface water quality standards based on the following designated best uses:

A. Drinking water source without conventional treatment but after disinfection
B. Outdoor bathing (organized)
C. Drinking water source after conventional treatment and disinfection
D. Propagation of wild life and fisheries
E. Irrigation, industrial cooling, controlled waste disposal

Drinking water is water intended for human consumption for drinking and cooking purposes from any source. It includes water (treated or untreated) supplied by any means for human consumption. IS 10500:2012, Indian Standard was formulated with the objective of assessing the quality of water resources, and specified the acceptable and the permissible limits in the absence of alternate source. It is recommended that the acceptable limit is to be implemented. Values in excess of those mentioned under "acceptable" render the water not suitable. Such value may, however, be tolerated in the absence of an alternate source.

Since all surface water bodies and streams courses in the study area are dry during field visit, surface water quality of samples analysed during previous monitoring period are discussed to present the surface water quality in the study area. Ground water sampling and analysis of physical, chemical & heavy metals have been undertaken during field investigation period (February, 2019). 8 ground water samples were collected from tube wells at different locations in the study area. These samples were collected as grab samples and were analysed for 37 water quality parameters. The location details of ground water samples collected and results of the samples analysed at VIMTA Labs Ltd., are presented in **Table-15, 16** and **17** respectively and locations are shown in **Figure-14**.

6.1 Surface Water

The analysis results indicate that pH is found to be 7.2 to 8.0, which is well within the specified standard 6.5-8.5. The TDS is observed to be 41,645 to 43,572 mg/l. Dissolved oxygen is observed to be 5.6 to 5.9 mg/l. The chlorides and sulphates are found to be 16,078.9 to 20,915.5 mg/l and 2,139.1 to 2,734.0 mg/l respectively. Bacteriological studies reveal the 5 MPN/100ML. The surface water is observed to be saline in nature.

6.2 Ground Water

The analysis of ground water samples indicate that these are mild alkaline with pH values ranging between 7.53 and 8.49 and found to be within drinking water standard (IS: 10500-2012).

TDS of Navinal, Bhujpar Mota, Jarpara, Kandagara and Nana Badia (955.60 mg/l to 1973.91 mg/l), Total Hardness of all samples except Jarpara (248.6 mg/l to 573.6 mg/l), Total Alkalinity of all samples, Calcium of Navinal, Moti Khakhar, Desalpar, Jarpara and Siracha (97.2 mg/l to 132.6 mg/l), Magnesium of all samples except Nana Badia (46.5 mg/l to 79.8 mg/l). Total Boron of Navinal, Desalpar and Siracha (0.52 mg/l to 0.62 mg/l), Chlorides of all samples except Nana Badia (472.6 mg/l to 996.8 mg/l), Sulphates of all samples except Moti Khakhar and Nana Badia (261.2 mg/l to 366.8 mg/l), Fluorides of Moti Khakhar, Desalpar and Siracha (1.1 mg/l to 1.2 mg/l), Copper of Bhujpar Mota and Jarpara (0.06 mg/l) and Manganese of all samples except Bhujpar Mota and Jarpara (0.12 mg/l to 0.16 mg/l) samples shows slightly higher values than acceptable limits but are within permissible limits.

TDS of Moti Khakhar, Desalpar and Siracha (2660.7 mg/l to 3322.3 mg/l), Total Hardness of Siracha (659.9 mg/l), Chlorides of Siracha (1321.6 mg/l), Sulphates of Moti Khakhar (486.5 mg/l), Manganese of Siracha (0.36 mg/l) and Iron of Jarpara (0.31 mg/l) samples show higher values than permissible limits.

Cyanide, Cadmium, Arsenic, Lead, Chromium and Mercury, parameters concerning toxic substance and the all other parameters are well within acceptable limits.

Table-15. Water Sampling Locations

Sample Code	Location	Distance from Project Site (km)	Direction
Surface Water Samples

6.2.1 Ion Distribution and Water Types

Since the chemistry of water directly hints the quality of water for various purposes, its monitoring and assessment gained substantial importance in the century. Water type/hydro-chemical facies evaluation is extremely useful in providing a preliminary idea about the complex hydro-chemical processes in the sub-surface. Determination of hydro-chemical facies was extensively used in the chemical assessment of ground water and surface water of several decades. This method is able to provide sufficient information on the chemical quality of water, particularly the origin.

The first attempt in this direction was made by Hill (1940) and which is modified by Piper (1944), Duroy (1948) further improved the piper plot. Piper diagrams are made in such a way that the milli-equivalent percentages of the major cations and anions are plotted in separate triangle. These plotted points in the triangular fields are projected further into the central diamond field, which provides the overall character of the water. In general, the sample points in Piper diagram can be classified into 6 major fields. They are 1. Calcium Magnesium Chloride, 2. Calcium Bicarbonate, 3. Sodium Chloride, 4. Calcium Sodium Bicarbonate, 5. Calcium Chloride and 6. Sodium Bicarbonate types. Details of Ion distribution and water type classification based on major anion and cation variation are presented in **Table-18** and Piper diagram with Ion distribution of ground water samples is presented in **Figure-15**.

In the present study, water type of all ground water samples is Sodium Chloride indicating brackish/saline origin.

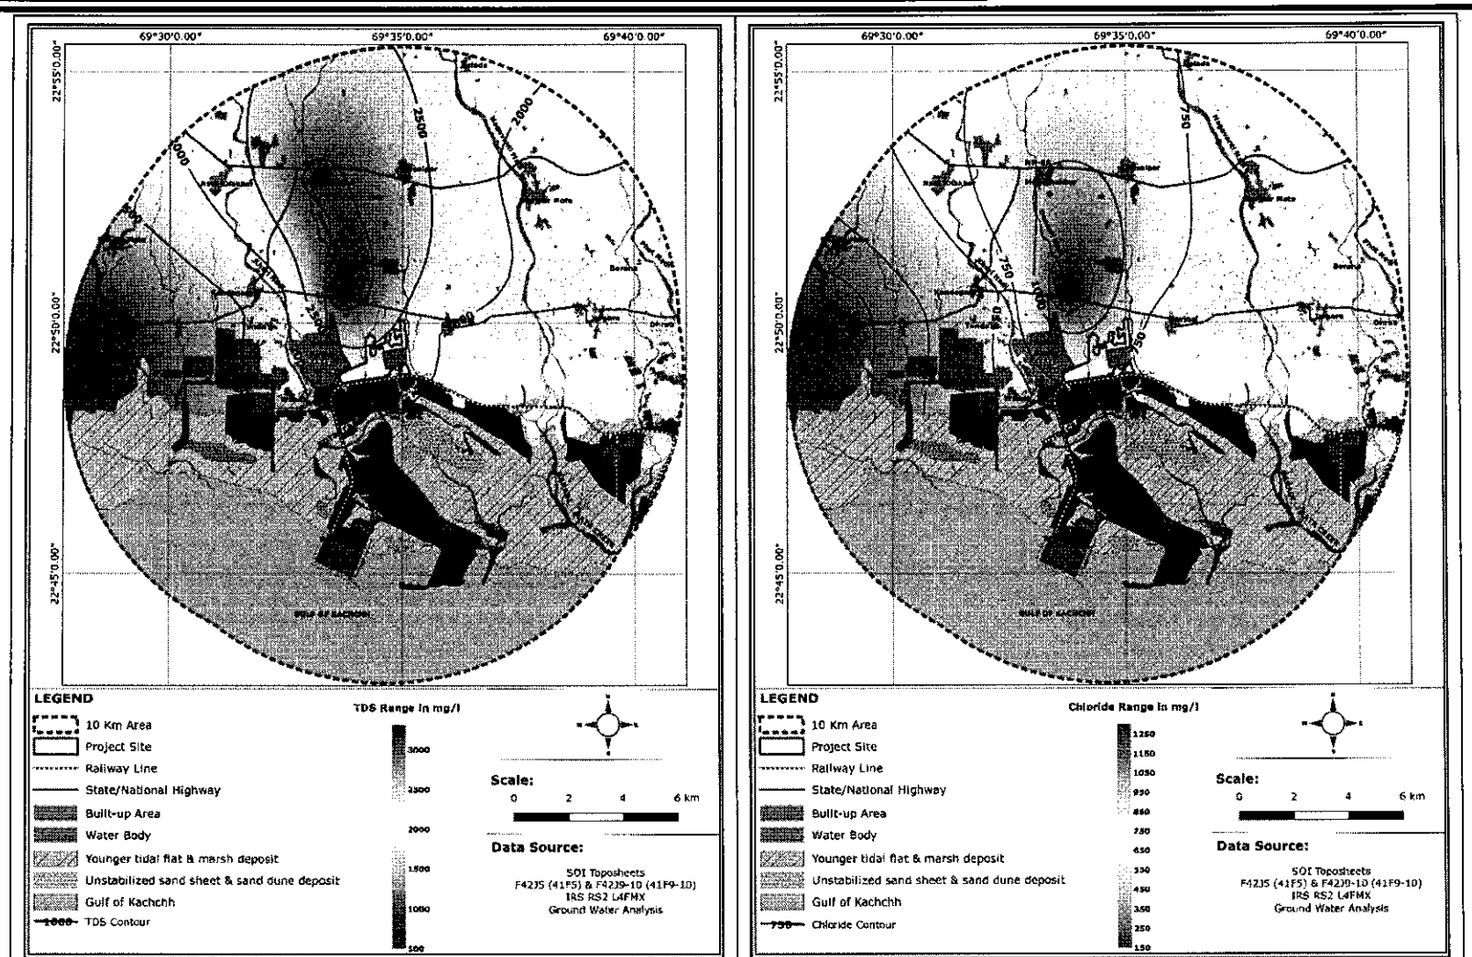
6.2.2 Ground Water Salinity

Salinity by definition is the presence of soluble salts in soils or water. Salinity processes are natural processes closely linked with landscape and soil formation processes; however, human activities can accelerate salinity processes, thereby further aggravating the land and water degradation of the affected region. Salinity in water is usually defined by the Total Dissolved Solids content (TDS, mg/l or g/l) or the Chloride content (Cl, mg/l) although the Chloride ion comprises only a fraction of the total dissolved salts in water. The classification of ground water based on TDS suggests four categories as given below:



Water Type	TDS Range (mg/l)
Fresh water	0 - 1000
Brackish	1000 - 10,000
Saline	10,000 - 1,00,000
Brine	>1,00,000

Along the coastal tracts of Gujarat, salinity of ground water broadly varies with geological formations and their disposition with reference to the coast. It is influenced by factors like sea water ingress, inherent salinity of the formations deposited under marine conditions and the structural features. Also, several creeks under tidal influence allow the sea water to invade and deteriorate the ground water quality in the phreatic aquifers. Thus, the soil and ground water salinity is a combined effect of a) inherent formation water salinity, b) sea water encroachment due to ground water overdraft, c) tidal water incursion through creeks/estuaries, d) saline water percolation in low lying marshy lands inundated by sea water, e) irrigation with saline water, and f) salt laden winds/sea sprays. In addition, in such fresh saline aquifers, where fresh water is underlain by saline water at deeper depths, the overdraft of ground water causes salt water upcoming of the underlying saline water.

Water level contours presented in **Figure-11** indicate that the water levels in and around Tragadi, Bhadia Nana, CGPL, Wandh, Navinal and Jarpara are below mean sea level and these areas are prone to saline water intrusion. To understand the salinity levels in terms of water quality, distribution of TDS and Chloride in ground water in the inland area of study area up to younger tidal flat deposit is presented in **Figure-16**.

A review of maps showing TDS and Chloride distribution in ground water in the inland area reveal that the TDS and Chloride distribution in the inland area show similar pattern and the ground water in entire area except around Tragadi and Bhadia Nana is moderately brackish with TDS more than 1000 mg/l. TDS and Chloride values of more than 3000 mg/l and 1000 mg/l respectively around Siracha and Moti Khakhar does not show any continuity from coast line and appears to be native to the deeper aquifers/formations.

3508

TDS in mg/l | Chloride in mg/l

7.0 IMPACT OF PROPOSED PROJECT ON WATER REGIME AND MITIGATION MEASURES

The construction, commissioning and expansion of any type of developmental projects have significant influence on the existing physical, biological and social components of environment.

The impact of proposed Copper Refinery on water regime may be in different ways and on surface or ground water or both. Water environment may be affected by the proposed project in terms of disturbing natural water courses or change in drainage pattern of the area, quantity and quality – due to drawl of water, discharge of polluted/waste water, by contaminated leachate from disposal/dumping of solid waste etc.

7.1 Natural Drainage and Water Bodies

Danesri Nadi, a seasonal stream passes through western part of the project site. Danesri Nadi originates from north of study area (3.80 km from study area) and has a catchment area of 3.75 sq km from railway line near project site. There are no other drainage courses in the project site.

7.1.1 Danesri Nadi Conservation Plan

Danesri Nadi along the project boundary will not be disturbed and maintained with necessary bank stabilization will be done with compaction/stone pitching and raising the bund up to 2.0m. The Danesri Nadi conservation plan will include a 50 m corridor from HFL along the stream course for green belt development and another 50 m along the green belt where any storage is coming (total of 100 m from HFL along the stream course near the storage areas) as presented in plant layout hereunder. No effluent will be discharged into this stream from the plant. Storm water drains carrying excess storm water from the plant area will be provided sand filters to arrest any suspended particles and quality will be monitored periodically to ensure contaminant free storm water only reaches Danesri Nadi. Danesri Nadi conservation plan is presented in **Figure-17**.

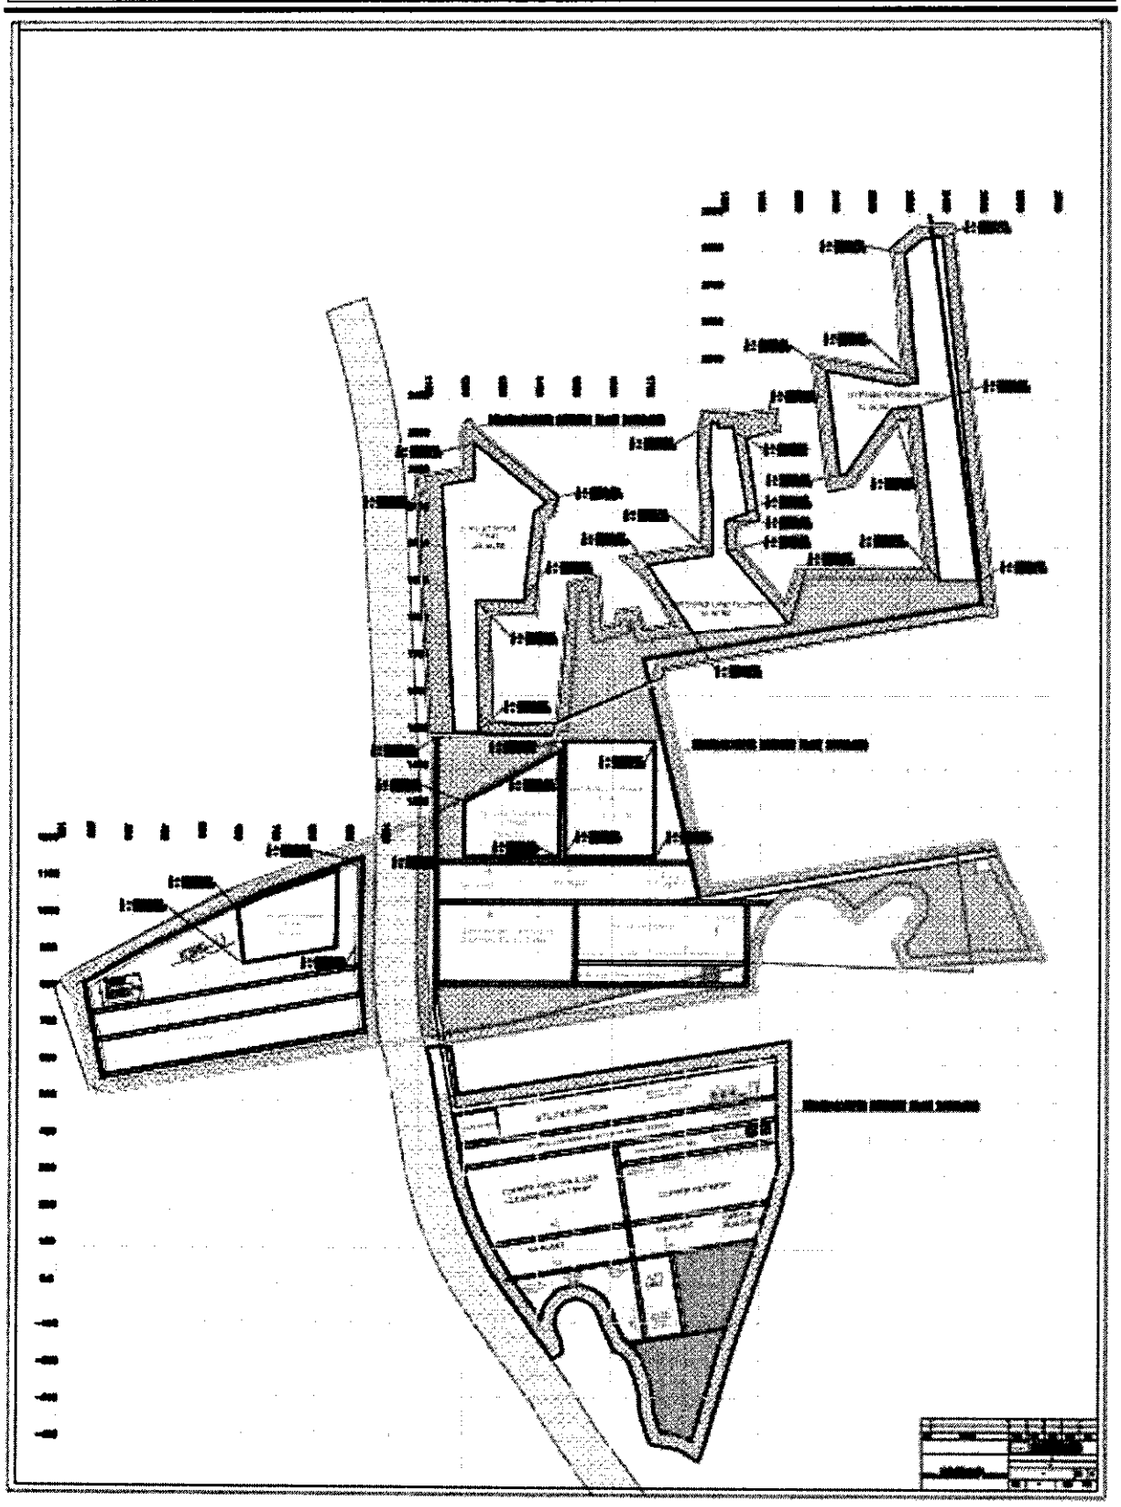

Figure-17. Danesri Nadi Conservation Plan

7.2 Drawing Surface/Ground Water

The total water requirement for the project (phase-I & phase-II) is about 35,496 KLD (35.5 MLD). 32,267 KLD (32.27 MLD) would be sourced from desalination plant of APSEZ Limited and supply through M/s. Mundra Utility Private Limited (MUPL). Balance will be met from treated/blowdown recycled water for greenbelt/cover, lime slurry preparation and reverse osmosis plant and multi effect evaporator. The water allocation letter is enclosed as **Annexure-I**. The details of usage of water and water balance for Flash Smelter Furnace (FSF) and TSL Furnace technologies are presented in **Table-1** and **Figure-3** &**3b**.

No ground water is proposed to abstract for the proposed project.

7.2.1 Water Availability

Use of sea water is in favour of saving fresh water resources, easing tensions in industrial water, availability in abundant quantity, scope of economy, environment etc.

7.3 Water Quality

A review of water quality during field visit and analysis results during February 2019 indicates that surface and ground water quality in the study area in general is poor.

TDS of Moti Khakhar, Desalpar and Siracha (2660.7 mg/l to 3322.3 mg/l), Total Hardness of Siracha (659.9 mg/l), Chlorides of Siracha (1321.6 mg/l), Sulphates of Moti Khakhar (486.5 mg/l), Manganese of Siracha (0.36 mg/l) and Iron of Jarpara (0.31 mg/l) samples show higher values than permissible limits.

Impact on water quality during construction and operation of any industry may be due to sewage generated from the domestic facilities, waste water generated from different plant operations, waste and oil spillage from the workshop, ash or other waste disposal etc. It is important to ensure that the water discharged from the project meet the relevant disposal norms and water used in the project meets the relevant national standards.

7.3.1 Waste Water

An integrated water system is proposed, where the effluent from the process units will be treated and reused to reduce water demand. It is also proposed to install a secondary Reverse Osmosis (RO) plant to further treat water from the effluent plant facility for effective use. Rejects from the reverse osmosis plant will be sent to Multi Effect Evaporator (MEE) for further recovery and solids generated will be sent to Secured Land Fill (SLF). This water would be utilized to meet the DM water and plant/utility requirement of proposed project. The water system is highly integrated and is designed for Zero Liquid Discharge (ZLD).

313 m^3/day (in both FSF and TSL Furnace technologies) of sewage generated from service water will be treated in STP and used for greenbelt, gardening and horticulture.

8.0 WATER RESOURCE MANAGEMENT PLAN

8.1 Ground Water Development

Since the entire water requirement would be sourced from desalination plant of APSEZ Ltd and supply through M/s Mundra Utility Private Limited (MUPL), no ground water development is envisaged for the proposed project.

8.2 Rain Water Management

Considering the ground water scenario in and around the project site (<2.0 m during post monsoon) and ground water flow direction in major part of the project site towards Gulf of Kachchh, the water conservation and artificial recharge system in proposed project may be more on water harvesting and reuse to reduce the dependency on external water and less on artificial recharge.

8.2.1 Rain Water Potential

To understand the quantum of water available from the project area for rain water harvesting, reuse and ground water recharge, a tentative run-off estimation based on different land uses in the area is worked out and presented in **Table-19**. The annual volume of rain water available from the project site spread in 256.58 ha (634 acres) is estimated at 6,11,007 m^3 (0.61 MCM) and during SW and NE monsoon periods is 6,00,057 m^3 (0.60 MCM).

Rain water from the contamination potential areas like plant operations, storage areas, landfill shall be diverted to effluent treatment facilities for treatment and reuse and from contamination free areas like administration and other buildings, open areas and green belt shall be directed to rain water harvesting and use for non-domestic usage and recharge.

Table-19. Annual & Monsoon Run-Off from Project Site

Sr.No.	Land Use	Area (ha)	Run-off Coefficient	Annual Rainfall (m)	Annual Run-off (m^3)	Monsoon Rainfall (m)	Monsoon Run-off (m^3)
1	Buildings/sheds	2.30	0.7	0.432	6957.44	0.425	6832.75
2	Plant & utilities	56.76	0.7	0.432	171817.06	0.425	168737.83
3	Roads & paved area	59.13	0.9	0.432	230131.59	0.425	226007.28
4	Green belt	89.84	0.25	0.432	97126.02	0.425	95385.37
5	Storage of Waste (slag yard, gypsum & Secured Landfill - Undeveloped land/clay loam)	48.55	0.5	0.432	104974.81	0.425	103093.50
Total/average		**256.58**	**0.61**	**0.432**	**611006.93**	**0.425**	**600056.73**

8.2.2 Rain Water Management in Smelter, Production Plant, Storage and Landfill Areas

Rain water from Concentrate Storage, Smelter Area and Slag Storage will be collected in separate tank installed in the areas of feed stock storage and conveying, smelting system which will potentially pollute the collected rain water. 4000 m^3 of rain water is expected to

2916 m^3/day in the case of FSF technology and 5028 m^3/day in the case of TSL Furnace technology of waste water generated from different plant operations will be treated in 5 ETPs and reused within the plant for process, cooling and other purposes.

7.3.2 Solid Waste

The main solid wastes envisaged from the proposed project are:

- ❖ Copper slag from copper smelter plant;
- ❖ Phosphogypsum from phosphoric acid plant;
- ❖ Hazardous cake produced from effluent treatment plant; and
- ❖ Scrubber cake from fugitive gas handling scrubbers.

Hazardous cake, ETP waste sludge, scrubber cake, spent catalyst and spent resins (from DM, RO and refinery) will be stabilized and stored in secured land fill of 13.35 ha as per guidelines of MoEF & CC/CPCB/GPCB. Further, an area of 18.2 ha and 20.63 ha are identified for the intermediate/emergency storage of copper slag and phosphogypsum. Provision would be made to reclaim the disposed copper slag and phosphogypsum from gypsum pond at a later stage for various utilization ventures.

The ETP cake, because of its hazardous nature, will be stored in a Secured Land Fill (SLF)). The SFL will be constructed as per CPCB guidelines. The SLF will have impervious layers of clay liner and HDPE liner. This will ensure that the ground water will not be impacted by the storage of the ETP cake. In case of any rupture/breakage or failure of the SLF bottom liner, any contaminant reaching sub-surface strata and water table will move towards Gulf of Kachchh following the ground water flow direction in the project area. The SLF facility will be provided with monitoring piezometric bore wells around it and the samples will be collected periodically to have a check on the sub-soil water quality.

Spillage of hazardous material such as waste oil, used paints, colour material, used batteries from store, workshop etc., may reach surface and ground water causing deterioration of water quality. These hazardous wastes shall be disposed-off as per Hazardous Waste Amendment Rules and it shall be sent to an authorized dealer.

collect from these areas. The water collected in these tanks will be treated in initial rain water treatment station and then goes to the advanced treatment section of the production effluent treatment plant for treatment before it is reused for production. The process flow of collection and treatment is presented in **Figure-18.**

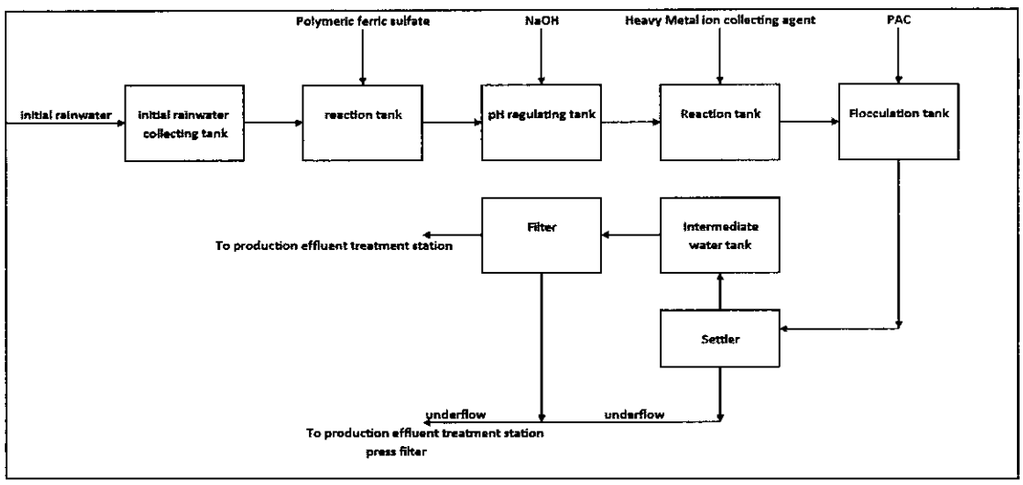

Figure-18. Process Flow of Treatment of Rain Water from Concentrate Storage, Smelter & Slag Storage

Rain water from the Gypsum Storage will be collected in a separate tank installed in Gypsum Storage area and about 4000 m^3 of rain water is expected to be collected from this area. The rain water collected in this tank will reused in the phosphoric acid manufacturing process and thereby reducing the fresh water consumption to that extent. Additional water if any will be used for spraying purpose in the Gypsum Storage area.

Rain water from Production Plant premises will be collected in a separate tank installed in the plant premises to collect rain water from all roofs. The collected rain water will be treated in initial rain water treatment station and then goes to the advanced treatment section of the production effluent treatment plant for treatment before it is reused for production. The process flow of collection and treatment is presented in **Figure-18.**

Rain Water from Secured Landfill (SLF) is required to minimize:

- ❖ Leachate generation by preventing ponding and the infiltration of water into the fill;
- ❖ Transport of contaminants from the landfill; and
- ❖ Erosion of the liner, solid waste or cover material.

The surface water drainage system performs the function of collecting and transporting run-off from the landfill and surrounding area to drains at the periphery of the landfill. Drainage channels should be located so that surface water run-off from the surrounding area is intercepted and diverted before it reaches the waste. Perimeter surface water control systems are usually designed to accommodate both off site run-off and onsite run-off.

Surface water run-off arising within the landfill area may be classified as that from cells under construction, operational areas and restored areas. Surface water can be controlled using drainage blankets, ditches, french drains and garland drains. It is necessary to provide a settlement pond to remove solids from surface water running off restored areas. The surface water from these areas may be used for plantation, toilets etc., provided they meet the receiving water standards.

Water from cells under construction may need to be pumped to the drainage channels or retention pond. Surface water from the restored areas should be transported via drainage layers incorporated in the capping system to the perimeter drainage channels. Surface water in active cells should be directed into the leachate collection system.

Surface water run-off from paved areas and site access roads shall be directed to storm water retention ponds or if necessary, to leachate storage facilities. Provision should be made for surface water from parking/fuelling/repair/maintenance/paved areas to pass through petrol/oil interceptors.

Considering only 80% of the run-off as available volume after evaporation, spillage and other losses, **2,21,433 m^3 (0.221 MCM)** of rain water will be available from **Smelter, Production Plant, Storage and Landfill** areas for use in the production process, green belt/plantation, toilets etc.

8.2.3 Rain Water Harvesting

Of the total project site, rain water from plant area, and secured landfill areas will be treated and used for plant and other purposes as described under 7.3. Admin building, canteen, SAP office building and engineering stores (shown as building area in **Table-19**) are found to be feasible for roof top water harvesting and use. An amount of 6,832 m^3 (0.007 MCM) of rain water will be available from these roof areas. Considering only 80% of the run-off as available volume after evaporation, spillage and first flush wastage, 5,566 m^3 (0.006 MCM) of rain water is available from the roof top areas for harvesting and use. A typical roof top rain water harvesting model is presented in **Figure-19**.

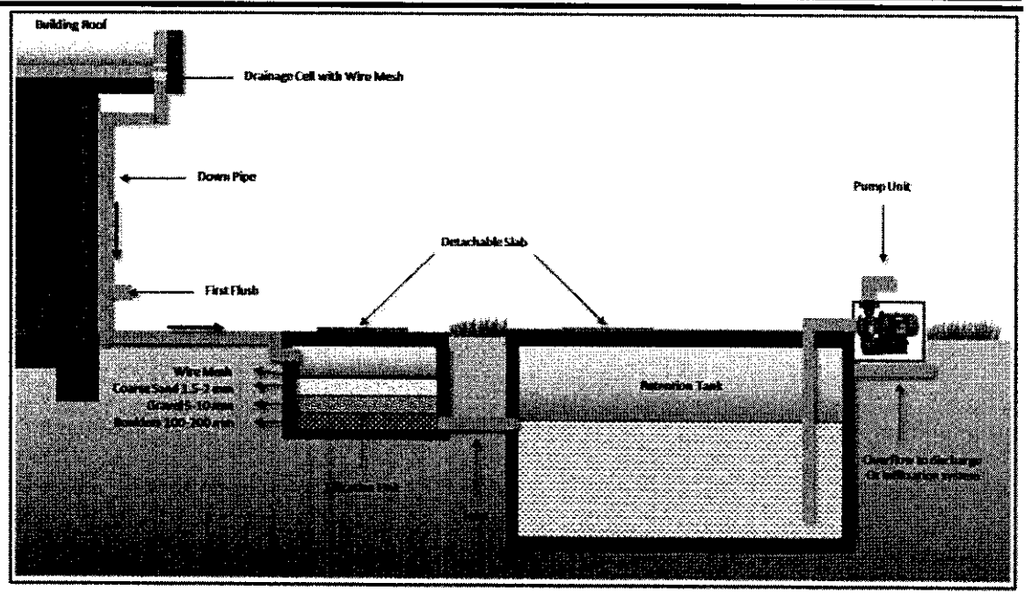

Figure-19. Typical Roof Top Rain Water Harvesting Model

To hold 80% of rainfall from these buildings during wettest months of July and August (308.1 mm) and use for the project during non-monsoon period, the volume of storage structure(s) shall be 4096 m^3. This storage may be spread in 3 locations with pit sizes of 32 m x 32 m x 4 m. For simultaneous use, the volume of storage structure may be reduced to 50%.

Considering 25% of the roads and paved area 50% of the green belt area free from contamination, 84,877 m^3 (0.085 MCM) of run-off from the rainfall collected in these areas is available for harvesting after 20% of this run-off accounting for evaporation, spillage and other losses.

The amount of run-off available from the above areas if managed with at least 70% efficiency will be **63,310 m^3 (0.063 MCM),** which would meet 69.96% of proposed green belt water requirement.

8.2.4 Measures towards Salinity Reduction in the Study Area

To address the severe problem of water and land salinity in the coastal regions of Gujarat, that posed a major threat to agriculture, animal husbandry, rural economy and urban development of the coastal stretches, the State Government appointed two High Level Committees (HLC-I and HLC-II) in 1970s and 1980s. The committees opined that the problem of poor recharge, extensive withdrawal of ground water, intrusion of tidal waters through creeks/estuaries and the increase in salinity has to be considered in its totality. No single solution will be applicable to the entire affected area or will be sufficient in isolation. Various measures involving engineering, agriculture, forestry, social and legal aspects have to from a part of an integrated approach to reduce the water and land salinity problem and improve conditions in the salinity affected areas. The Committee recommended several salinity prevention techniques, outline in **Table-20**, including construction of a large number of structures to achieve the following objectives:

1. To control surface and subsurface salinity ingression along the coastal stretches
2. To recharge and enhance the quality of underground aquifer of the coastal belt
3. To promote agricultural activities by providing surface water facilities to the farmers in and around the constructed civil structures
4. To achieve an overall improvement in socio-economic conditions of the village community in the vicinity of the constructed civil structures

Table-20. Salinity Prevention Techniques Recommended by HLC-I and HLC-II in Gujarat

Salinity Control Techniques	Recharge Techniques
• Tidal regulators • Bandharas • Fresh water barrier • Extraction barrier • Static barrier	• Check dams • Recharge tanks • Recharge wells • Spreading channels • afforestation
Management Techniques	**Land Reclamation**
• Change in cropping pattern • Regulation of ground water extraction	• Coastal land reclamation

It is a well-known fact that no recharge or salinity control scheme will give its full long-term advantage, unless supported by proper management strategies such as control over the pumping and use of ground water, conjunctive use of ground water and surface water and cultivation of less water intensive crops that are also salt tolerant.

A review of measures implemented under Salinity Ingress Prevention Scheme, Government of Gujarat indicate that:

- ❖ Ground water recharge techniques such as check dams, recharge tanks, spreading channels and recharge wells as well as afforestation measures were found to be feasible in augmenting the ground water recharge.
- ❖ Tidal regulators and bandharas were found to be effective in preventing upstream movement of tidal water through river channels.

Though, ground water abstraction is not proposed for the present project, based on the measures recommended by HLC-I & II and implemented under Salinity Ingress Prevention Scheme, the following measures are proposed to implement in the vicinity of the project site as a corporate responsibility:

- ❖ A fund of Rs. 1600 Lakhs has been allocated for **Drinking water supply** to nearby villages **Siracha, Jarpara, Desalpar and Moti Khakhar**, which will limit the ground water abstraction through tube wells.
- ❖ A fund of Rs. 120 Lakhs has been allocated for carrying out afforestation activities with suitable species in village panchayat lands, waste lands, open lands in SEZ area, areas of

degraded vegetation in public lands of owners motivated towards the community benefit, which will slowdown the surface run-off and enhance recharge.

- **Drinking water supply** to nearby villages Siracha, Navinal, Jarpara, Wandh and Kandagara, which will limit the ground water abstraction through tube wells
- **Afforestation** with suitable species in Government lands, waste lands, open lands in SEZ area, areas of degraded vegetation in nearby forests and public lands of owners motivated towards the community benefit, which will slow down the surface run-off and enhance recharge
- **Water spreading channels** along Mundra-Mandvi road on the upstream side, which will enhance recharge
- **Check dams** across the stream course of Khari Nadi, Danesri Nadi and Nagavanti Nadi – dam constructed across a drainage course to reduce water flow velocity and thereby enhancing recharge
- **Bandharas** near river/stream mouths of stream near Bhadia Nana, Danesri Nadi and Nagavanti Nadi as recommended by HLC in coordination with Salinity Ingress Prevention Scheme - bandharas are structures constructed near the mouths of rivers to top tidal/backwater ingress into the land by sealing the mouths of the rivers. Locations of bandharas are shown in the below **Figure-20**.

Locations of water harvesting and salinity reduction measures are shown in **Figure-21**.
