**Status of River Hindon, CETPs, STPs, GPI existing in Hindon River basin along with Comprehensive Action Taken Report including Project Proposal for “Water Quality Monitoring of Hindon River Basin” for the year 2022-27 in the State of Uttar Pradesh submitted to NMCG on 19-11-2022 for approval is also entailed as below:-**

- Hindon River originates from lower Shivalik ranges in District Saharanpur of Uttar Pradesh and is primarily a rain fed river. The basin area falls in the districts of **Saharanpur, Muzaffarnagar, Shamli, Meerut, Baghpat, Ghaziabad, Gr. Noida and Gautambudh Nagar (Noida)** in Western Uttar Pradesh and covers a distance of about 300 km, before joining the river Yamuna, downstream of Delhi.
- The river Hindon is one of the important rivers in Western Uttar Pradesh (India) having a basin area of about 7000 km<sup>2</sup>. The catchment area of the river lies between latitude 28°30'27" to 30°15'22" N and longitude 77° 20'18" to 77° 50' 16" E. During non-monsoon, the river is dry on upstream of Saharanpur and carries no water in it. Flow in the river starts with discharge of municipal sewage and trade effluents from Saharanpur onwards. The river gets the flow only during monsoon season through rainwater and groundwater recharge.
- The **River Kali (West)** and **River Krishni** are the main tributaries of River Hindon. The river receives considerable amount of waste water every day from the industries and sewage system flow from municipal areas of Saharanpur, Muzaffarnagar, Shamli, Meerut, Baghpat, Gr. Noida, Noida and Ghaziabad which leads to deterioration of its water quality.

## I. INTRODUCTION:

Hindon River originates from lower Shivalik ranges in District Saharanpur of Uttar Pradesh and is primarily a rain fed river. The basin area falls in the districts of **Saharanpur, Muzaffarnagar, Shamli, Meerut, Baghpat, Ghaziabad, Gr. Noida and Gautambudh Nagar (Noida)** in Western Uttar Pradesh and covers a distance of about 300 km, before joining the river Yamuna, downstream of Delhi.

The river Hindon is one of the important rivers in Western Uttar Pradesh (India) having a basin area of about 7000 km<sup>2</sup>. The catchment area of the river lies between latitude 28°30'27" to 30°15'22" N and longitude 77°20'18" to 77°50'16" E. During non-monsoon, the river is dry on upstream of Saharanpur and carries no water in it. Flow in the river starts with discharge of municipal sewage and trade effluents from Saharanpur onwards. The river gets the flow only during monsoon season through rainwater and groundwater recharge.

The **River Kali (West)** and **River Krishni** are the main tributaries of River Hindon. The river receives considerable amount of waste water every day from the industries and sewage system flow from municipal areas of Saharanpur, Muzaffarnagar, Shamli, Meerut, Baghpat, Gr. Noida, Noida and Ghaziabad which leads to deterioration of its water quality. Along its course in the State, effluents from industrial, domestic as well as mining, agricultural sources along with dumping of solid waste are some of the causes of pollution in the river.

As per the monitoring of river water quality in the identified polluted stretch of river Hindon, water is neither fit for Drinking nor for Outdoor bathing and Fish Culture etc. It can only be used for industrial cooling or controlled waste disposal (Class-E, specified as per IS-2296-1982).

- **Pollution Sources in Hindon River:**

As pollution watch dog and regulatory agency, even with best of intentions, Uttar Pradesh Pollution Control Board at times is not able to identify and act against the violators causing pollution and bring them to books. Weak and scattered river monitoring mechanism is one of the main causes of this, siting of monitoring stations and monitoring of right parameters to determine the river quality at different stations gives strength to decision making for betterment of river health. Siting of monitoring stations is done primarily to obtain baseline data, study trends of pollution load at different times or in different seasons, and study impacts of particular drain or industry or region on the river health.

Similarly, it is important to know the parameters to be monitored at different stations. Monitoring at regular frequency and in real time where required is important so that change in trends can be monitored on a regular basis, source of specific pollutants can be back-tracked to a particular industry or drain in case of sudden rise in a particular parameter and public warning can be issued in case of alarming situation.

The State Board requires fund for the effective monitoring of critically polluted river stretch of Priority- I Hindon & its tributaries. For above mentioned requirement, this proposal is being proposed, which will be executed with the help of the funds provided by NMCG.

Uttar Pradesh Pollution Control Board has identified Hindon River & its tributaries where stringent monitoring protocol should be implemented. The river water quality monitoring data can be used to assess and interpret sources of pollution and study its trends, it is important to build a strong network for river water quality monitoring. Thus, for effective and on time monitoring of the existing network, dedicated staffs and the online monitoring (OCEMS) of drains is required to be done in order to sincerely monitor the violators. Brief outline about existing Hindon river monitoring is given below:

## II. BRIEF METHODOLOGY:

### A. Identification of Pollution sources

There are many sources of the pollution discharged into the Hindon River and its tributaries Kali (west) & Krishni which form an entirely rain-fed water resources system. The river system is receiving industrial and municipal untreated waste water which is being discharged directly or via drains into the river. Apart from the urban and industrial point source pollution, Agri-chemical run-off from the fields is contributing to the water quality problems as non-point source pollution.

The problems do not end with the surface water degradation. In parts of the basin the ground water quality is not fit for drinking purpose as per specifications proceeded by Bureau of Indian Standards (BIS, Page 4 of 24 2012). River Kali itself contribute more than 50% of total metallic load to river Hindon before it reaches Ghaziabad, which is also highly industrial and urbanized. Apart from water quality issues, availability of water is also problematic in the Hindon basin. Being a non-perennial river, it is sluggish throughout the year except during high flow periods in the monsoon season. Biological and geological breakdown in the summer season leads to the accumulation of chemicals during the dry session, followed by dilution of those chemicals by monsoonal rainfall. Above mentioned problems can be solved only

through an integrated approach with a package of water quality and water quantity related measures across sectors and at a river basin scale—from ridge to valley.
