BEFORE THE HON'BLE NATIONAL GREEN TRIBUNAL

PRINCIPAL BENCH, NEW DELHI

ORIGINAL APPLICATION No. 751 of 2024

IN THE MATTER OF:

Abhisht Kusum Gupta & Anr **.... Applicant**

Versus

State of Uttrakhand & Ors. **... Respondent**

AFFIDAVIT ON BEHALF OF NATIONAL MISSION FOR CLEAN GANGA i.e. R-5

MOST RESPECTFULLY SHEWETH:

I, Anup Kumar Sirvastava, aged about 58 years, presently working as Executive Director (Technical) in the National Mission for Clean Ganga (NMCG), Ministry of Jal Shakti, Government of India, New Delhi do hereby solemnly affirm and state as under:

1. That I am working as Executive Director (Technical) in the National Mission for Clean Ganga (NMCG), Ministry of Jal Shakti, Government of India, New Delhi. I am duly authorized for and on behalf of the Respondent No. 5 to swear to the present affidavit. I am fully conversant with the facts and circumstances of the present case from the records.

2. That I am the Authorized Representative of the Respondent No. 5 in the captioned matter. I am fully conversant with the facts of the case and am thus competent to depose the present affidavit.

NOTARY M. ARYA Regd. 19591 APPROVED BY GOVT. OF INDIA

Major Dhyanchand National Stadium First Floor New Delhi National Mission for Clean Ganga

3. That at the outset it is submitted that NMCG is one of the authorities constituted in accordance with the provisions of sub-section 3 of Section 3 of the Environment (Protection) Act, 1986 vide notification no. S.O. No. 3187(E) dated 07.10.2016, published in the gazette of India. NMCG has been mandated with for the implementation of programs for protection, prevention and rejuvenation of river Ganga and its tributaries christened as the Namami Gange Programme (NGP) of the Central Government. The NGP focuses on effective abatement of pollution and rejuvenation, protection and management of the river Ganga and its tributaries through interventions like taking up sewerage infrastructure projects for interception, diversion and treatment of waste water discharge from open drains into the river through construction of new STPs and/or rehabilitation and augmentation of existing STPs, laying of sewage pipelines etc.

4. That the present Original Application No. 751 of 2024 has been filed by the applicant raising grievance concerning environmental pollution in River Mandakini, a tributary of River Alaknanda, which originates from Chaorabari Glacier and runs approximately 81 km between Rudraprayag and Sonprayag, merging with River Songanga at Sonprayag and further flowing past the Hindu temple Madhyamaheshwar at Ukhimath. The applicant's grievance is primarily that there is no Sewage Treatment Plant (STP) at Shri Kedarnath Dham and untreated sewage is being discharged into River Mandakini, and further that there is absence of proper solid waste management system at Kedarnath Dham, thereby aggravating pollution in the river.

5. That it is respectfully submitted that no sewerage infrastructure project at Shri Kedarnath Dham has been taken up by NMCG, nor is any such project presently pending with NMCG. The responsibility for development of sewerage infrastructure at Kedarnath rests with the

NOTARY M. ARYA Regd. 19591 APPROVED BY GOVT. OF INDIA

Major Dhyanchand National Stadium First Floor New Delhi National Mission for Clean Ganga

State Government, which is undertaking the work as per its approved master plan. However, in compliance with the directions of the Hon'ble Tribunal in O.A. No. 751/2024, the matter was taken up with the State Government in the meeting convened on 11.11.2024. Copy of the Record of Discussion dated 11.11.2024 has been marked and annexed herewith as **'Annexure A'**.

6. That in the aforesaid meeting, the State Government was advised to carry out a comprehensive assessment of the solid and liquid waste generated in and around Shri Kedarnath Dham and to confirm whether the facilities proposed under the approved master plan, being executed by PWD Uttarakhand, would be sufficient to effectively address the issue of pollution in the area.

7. That it is further submitted that vide letter dated 13.11.2024, NMCG shared the Record of Discussion of the meeting held on 11.11.2024 with the State Government and simultaneously instructed the District Magistrate, Rudraprayag, as well as the Tourism Department, Urban Development Department, and Environment Department of the State to furnish a detailed report outlining the measures taken to address the environmental challenges at Shri Kedarnath Dham, together with other initiatives undertaken for management of such issues.. A copy of the letter dated 13.11.2024 marked to State has been marked and annexed herewith as **'Annexure B'.**

8. That it is submitted that NMCG has received a detailed report from the State Government wherein it has been informed that a committee was constituted for site inspection. The said report records that discussions were held with a Professor from IIT Roorkee following the site inspection carried out on 20.12.2024, and further provides an elaborate account of the

NOTARY M. ARYA Regd. 19891 APPROVED BY GOVT. OF INDIA

Major Dhyanchand National Stadium First Floor New Delhi National Mission for Clean Ganga

measures implemented to address the environmental challenges in the region. A copy of the detailed report from the state has been marked and annexed herewith as **'Annexure C'.**

The summary of the key measures indicated in the said report is reproduced hereinbelow for ready reference.

a) *The construction of 600 KLD STP is 80-85% complete. The remaining works like roof work, flooring work and internal installations which was due by December 2024, have been hampered, due to extreme cold temperature, snowfall, ineffectiveness of welding in extreme cold climatic conditions, cement setting issues and low availability of skilled labours along with other causes. Despite this, efforts are being made & work is in progress in prevailing harsh climate conditions for timely completion of STP so as to complete the STP.*

b) *The liquid waste management was designed for a population of 5000 residential and 20,000 floating population at Dham and regarding the higher numbers of pilgrims reported in the joint committee report dated August, 2024, it is to be clarified that higher numbers of pilgrims mentioned was effectively the number of pilgrims moving from Sonprayag to Kedarnath area and not more than the designed population stays at Kedarnath Dham in a given day. Further STPs (4 in number totalling 222 KLD) along with sewerage network and I&D of drains are under construction along the Kedarnath yatra trek/route at Gaurikund.*

c) *Currently, for pilgrims staying in the camps, 155 nos. of fixed toilets are in place based on soak pit systems. The joint committee highlighted seepage at few locations, however these have been rectified. Professor A.A. Kazmi has advised for installation of*

NOTARY M. ARYA Regd. 19591 APPROVED BY GOVT. OF INDIA

Major Dhyanchand National Stadium First Floor New Delhi National Mission for Clean Ganga

Johkasou System for management of sewage in such locations, in continuation of which proposal will be submitted for sanction/approval.

9. That, the answering respondent herein craves leave of the Hon'ble Tribunal to file additional reply, in future, if required.

10. In light of the above submission, it is respectfully submitted that this Answering Respondent DoWR, RD & GR, shall abide by any order(s) or direction(s) passed by this Hon'ble tribunal in this Application.

DEPONENT

VERIFICATION

I, the deponent above named do hereby verify that the contents of the aforesaid affidavit are true and correct to my knowledge and belief and nothing material has been concealed therefrom. Verified at New Delhi on this ____ day of ____ 2024.

Record of Discussion (RoD) held on 11.11.2024 at 11.00 AM under the Chairmanship of DG, NMCG

A meeting was held with the officials of Uttarakhand on 11.11.2024 at 11.00 AM under the Chairmanship of Director General NMCG for discussion regarding the Hon'ble NGT Matter OA No. 751/2024 - Abhishit Kusum Gupta vs. State of Uttarakhand. The list of participants present in the meeting is at ***Annexure I.***

Actionable points discussed in the meeting are as follows: -

1. **Sewage management:**
   a) A detailed assessment of wastewater generation at Kedarnath Island area is required, especially during peak season, to determine whether the 600 KLD STP under construction is adequate especially in view of the number (peak) quoted by joint committee before NGT. The same may also be corroborated by Tourism Department of Uttarakhand.
   b) The report may include the liquid waste management for Tent area (outside Kedarnath Island) also.

[Action: DM, Rudraprayag/ Tourism Dept. UK]

2. **Solid Waste Management:** Similarly, the report should also include solid waste generation at Kedarnath Island area & along trekking route and waste management options being adopted by the State Government including relevant details of the waste management facilities.

[Action: DM, Rudraprayag/ Urban Development Dept. UK]

3. It was decided in the meeting that there is need to deal the solid waste management issue in a more comprehensive manner and hence state may engage the experts from NIUA (National Institute of Urban Affairs) and IIT Roorkee to assess and prepare the comprehensive waste management plan. NMCG may facilitate the joint meeting of state officials, NIUA and IIT Roorkee.

[Action: NMCG]

4. **Construction and Demolition (C&D) Waste:** Details regarding the quantity of C&D waste generated & disposed-off and time lines/agency responsible for disposing remaining debris in Kedarnath should be included in the report to be submitted to the NMCG.

[Action: DM, Rudraprayag/ UKPCB]

5. **Report Submission:** The detailed report may be submitted to NMCG by 2nd December 2024. The State's report may also include other initiatives taken by the State in managing the environmental challenges in Kedarnath.

[Action: DM, Rudraprayag/ Tourism Dept./Urban Development Dept./Environment Dept.]

The meeting ended with thanks to the Chair.

****

Compliance report in O.A. No. 751/2024 in Abhisht Kusum Gupta Vs State of Uttarakhand

This is in reference to the Hon'ble National Green Tribunal (NGT) order dated 04.10.2024 in O.A. No. 751/2024 Abhisht Kusum Gupta Vs State of Uttarakhand, read with National Mission for Clean Ganga letter No. Er- 12011/17/2017- Office o/dir (T-III) NMCG dt. 13.11.2024, where in detail report was asked from District Magistrate, Rudraprayag, Tourism department, Urban development department and Environment Department. In continuation of the above directions, a committee was constituted for site inspection and discussions with Professor of IIT, Roorkee.

The following committee members inspected the site on dated 20.12.2024 and discussions were held with Proff. Kazmi, IIT Roorkee.

- ACEO, KDA, Rudraprayag.
- Executive Engineer, PWD, Guptkashi
- Environment specialist, SMCG, Dehradun.
- Executive officer, Nagar Panchayat, Kedarnath
- Solid waste management consultant, Urban Development Directorate, Dehradun.
- Assistant engineer, Urban Development Directorate, Dehradun.
- District tourism development officer, Rudraprayag.
- Project manager, Jal Nigam, Srinagar.

A. Hon'ble Tribunal in order dt. 04.10.2024 has stated that

a. **Para 08:** - *The above report clearly indicates that there is no STP in Kedarnath to treat the sewage. One STP of 600 KLD is under construction and annexure C to the report states that 60% of work is over and construction of STP will be completed by December 2024. No timeline has been provided for household connection to the STP. It also needs to be ascertained that 600 KLD of STP is adequate.*

Response: -

i. Under Shri Kedarnath Dham Master plan, 84 buildings (total 862 modules) are being constructed or to be constructed in the temple island area. 04 persons per module cumulates to **3448** Residential/Permanent population. For STP design calculation, Residential/Permanent population was taken as 5000 along with 20,000 floating population. Per capita Water usage/sewage generation was taken as per National Building Code, Part-9 & Central Public Health & Environmental Engineering Organization Manual 1999. Due consideration was also given to cold climatic conditions at the Dham. Sewerage system with STP and DPR was vetted by Jamia Milia Islamia University, Delhi and CSIR-CBRI Roorkee. Copy of the vetted process design is enclosed as **Annexure-*1***

ii. In the design plan, there are branching sewerage channels in 3 major regions, along Saraswati edge, Mandakini edge and in the central street area. Out of these, as the buildings to be constructed in the Master plan are completed or are in near completion along the Mandakini edge, the sewerage channel along this edge measuring 400 meters in length has been installed. As sewerage channel laying work is possible only after

development /finalisation of surroundings and plinth level around the buildings, and the building construction works as per Master plan is ongoing on Saraswati edge and in the central street area, therefore the installation work of the sewerage channel is ongoing in these two regions. Post confluence of the sewerage channels from the three regions measuring 575 meters length is near completion (80%). Due to the ineffectiveness of welding in extreme cold climatic condition, cement setting issues and low availability of skilled labours, work progress in the month of December was hampered, however efforts are being made to complete the work in due time.

iii. The construction of 600 KLD STP is 80-85% complete. The remaining works like roof work, flooring work and internal installations which was due by December 2024, have been hampered, due to extreme cold temperature, snowfall, ineffectiveness of welding in extreme cold climatic conditions, cement setting issues and low availability of skilled labours along with other causes. Despite this, efforts are being made & work is in progress in prevailing harsh climate conditions for timely completion of STP so as to complete the STP. ***Annexure-2- Photographs of the site.***

iv. The liquid waste management was designed for a population of 5000 residential and 20,000 floating population at Dham and regarding the higher numbers of pilgrims reported in the joint committee report dated August, 2024, it is to be clarified that higher numbers of pilgrims mentioned was effectively the number of pilgrims moving from Sonprayag to Kedarnath area and not more than the designed population stays at Kedarnath Dham in a given day. Further STPs (4 in number totalling 222 KLD) along with sewerage network and I&D of drains are under construction along the Kedarnath yatra trek/route at Gaurikund.

v. Currently, for pilgrims staying in the camps, 155 nos. of fixed toilets are in place based on soak pit systems. The joint committee highlighted seepage at few locations, however these have been rectified. Professor A.A. Kazmi has advised for installation of Johkasou System for management of sewage in such locations, in continuation of which proposal will be submitted for sanction/approval.

B. Para 09: - *In respect of solid waste management, the committee has found that there is no waste processing plant established in Kedarnath for the management of solid and plastic waste which is estimated to be 1.667 TPD during the season.*
(Read with)

Para 10: - *The observations of the committee is that waste management facilities needs to be enhanced.*

Response

i. Currently the total solid waste generation was estimated to be 1.667 TPD and this is being managed with following resource.

1. Status of Human Resource

a.	Total number of Paryavaran Mitra	-	190
b.	Environment Supervisor	-	07

2. Status of SWM/PWM

a. Solid Waste Collection Vehicle - 01 (mini tractor with trolley)

b. Processing Facility - 01 MRF and 01 (for segregation of dry waste) Bailing machine (Photograph attached -01)

3. Deposit Refund System (DRS) – New Initiative

a. Under this system all the plastic bottles of water or soft drinks are labelled with QR code. Every bottle is charged Rs. 10.00 extra on MRP. Post use the customer can deposit these bottles at multiple kiosks along the track and can get their Rs. 10.00 refunded.

b. The initiative has engaged the local community and has promoted responsible waste disposal practices and environmental awareness.

c. DRS Progress Status –

i. Total QR provided on plastic bottle/tetra pack is 1,72,100.

ii. Out of above, 1,39,838 Bottles/Tetra Pack (81%) with QR have been returned by the customers for recycling. (Photograph attached-02)

ii. Prospective Solid Waste Management Action Plan -

1. Solid Waste Management Action Plan/Detail Project Report costing Rs. 309.46 Lacs has been prepared and submitted to urban development (***Annexure-3)*** that includes: -

a. For Dry Waste, Executive Officer Nagar Panchayat appraised that 01 TPD capacity Material Recovery Facility centre will be established in collaboration with the Heal Himalaya Foundation with equipments like Plastic Compactor, Shredder, Ballistic Separators, etc.

b. For Wet waste management an Organic Waste Composter of 500 Kg per day capacity is proposed at the MRF and additional 8 Organic Waste Composters with capacity of 50 kg per day are to be established at 08 different locations for processing of Wet Waste generated in outer periphery/tent colony. Contour map of Dham area and the plan is annexed in ***Annexure-4***

c. As per suggestions of Dr./Prof. Kazmi, IIT Roorkee verification of the performance of above proposed organic waste composter was needed with reference to low temperature areas and in continuation satisfactory performance reports issued by agencies, where these have been established have been received. ***Annexure-5***

C. Para 11: - *The joint committee during the visit found a lot of construction and demolition waste materials like iron rods/pipes and cemented broken bricks etc., lying in many places due to ongoing construction activities.*

Response: –

i. As mentioned in the 1st para, buildings and other structures are being constructed as per the Master plan in Dham area. Demolition waste materials like Iron rods, pipes and cement blocks and excavated soil are being used for back filling/foundation filling of under construction buildings and also to construct approach.

ii. In the year 2023-24, 10 old buildings were demolished, generating approximately 2400 cum of waste material, which was completely used in backfilling of Sangam Ghat, Arrival plaza and also in the foundation filling of under construction buildings.

iii. The plan of Construction agency (PWD) is to utilise all the demolition waste for backfilling in low lying areas and also to strengthen such locations. As soon as the construction will be completed, the entire C&D waste will be utilised in such locations. ***Annexure-6.***

Raw Sewage and Treated Sewage Characteristics of 600 KLD Sewage Treatment Plant at Kedarnath Dham, UK

- **Treatment Capacity:**

  The Sewage treatment plant is designed to treat 6,00,000 Litre per day of sewage generated from the site. The treated sewage can be used for agriculture, horticulture or can be discharged to public drain.

- **Characteristics of Raw & Treated Sewage:**

The Sewage characteristics considered for the design purpose of the plant are as mentioned below:-

S. No.	Parameters	Raw Sewage	Treated Sewage	Treated Sewage for Discharge into Inland surface water as per CPHEEO Manual (Table 5.3)
1.	Daily average flow	600 KLD	600 KLD	-
2.	Design temperature	15-25°C	15 -25°C	-
3.	pH	6.5 – 8.5	6.5 – 8.5	5.5 to 9.0
4.	Total suspended solids (TSS)	400 -450 mg/L	< 10 mg/L	10 mg/L
5.	Conductivity	50 µS	-	-
6.	Total BOD	250 – 300 mg/L	< 10 mg/L	10 mg/L
7.	Total COD	400 – 450 mg/L	< 50mg/L	50 mg/L
8.	Oil and grease	<10 mg/Ltr	Nil	NIL
9.	Total ammoniacal nitrogen	<25 mg/L	<5 mg/L	5.0 mg/L
10.	Total Nitrogen	<10 mg/L	<5 mg/L	10 mg/L
11.	Total Phosphorous	5 – 12 mg/L	<2 mg/L	-
12.	Total coliform count	$1x10^6$ MPN/100ml	<100 MPN/100ml	<100 MPN/100ml

- **Design & Peak Flow:**
  - Design Flow : 600 KLD = **30Cum/hr.**
  - Working Hours: **20.**
  - Peak Load Factor: **2**
  - Peak Flow: 30 Cum/hr X 2 = **60Cum/hr.**
- **The Design** of various units are as per CPHEEO manual on Sewerage and Sewage Treatment Systems except Electrocoagulation reactors.

ELECTROCOAGULATION (EC) PROCESS DESCRIPTION

- Water is one of human being's most fundamental needs.
- **Globalization**, uncontrolled growth, and other causes are causing a lack of fresh water, and many countries are concerned about the problem. As a result, it's critical to consider water purifying processes that are both effective and affordable, as well as reusability.

- People are presently aware of a wide range of wastewater treatment options. With recent technological advancements in the **electrochemical** area, a new technique known as electrocoagulation has been introduced into the business.

The Process of Electrocoagulation in Sewage Treatment Plants

Ref. Science journal - Science Direct, Jan 26th 2021

- Here major goal is to focus on **electrocoagulation** process technique and applications!

Introduction of the process

- Filtration, air stripping, ion exchange, chemical precipitation, chemical oxidation, carbon adsorption, ultrafiltration, reverse osmosis, electrodialysis, volatilization, and gas stripping are the traditional physico-chemical treatment techniques utilized for wastewater treatment.
- Oxidation of Biological mass by aeration technique is widely used in treatment of sewage water. Aeration of the sewage generates aerobic bacteria which in turn destroys the disease-causing bacteria in the liquor. But this process is viable at ambient temperature because the growth of aerobic bacteria can only occur at the RT.

- The **electrocoagulation** process is the viable option for such conditions.
- The **electrocoagulation** process is a sophisticated electrochemical technology-based procedure. **Electrocoagulation** (EC), which involves sending an electric current through water to remove pollutants, has shown to be quite successful. Anode and cathode geometries such as plates, balls, fluidized bed spheres, wire mesh, rods, and tubes have been used in electrocoagulation systems for many years.
- Water containing foodstuff wastes, oil wastes, dyes, suspended particles, chemical and mechanical polishing waste, organic matter from landfill leachates, de-fluorination of water, synthetic detergent

Dehr
AHMEDABAD

effluents, mine wastes, and heavy metal-containing solution have all been treated with it in recent decades. By decreasing electricity usage and miniaturizing the required power supply, EC has become one of the most cost-effective

- wastewater treatment systems in the world.

Parameters removed by EC

- **EC removes** metals, colloidal solids and particles, and soluble inorganic contaminants.
- EC treats a wide spectrum of waste streams comprising heavy metals, virus, bacteria, pesticides, arsenic, MTBE, cyanide, Biochemical oxygen demand (**BOD**), Total dissolved solids (**TDS**), and Total suspended solids (**TSS**) using a specialized treatment chamber and electricity. It is used to treat wastewater from municipal, industrial, and commercial sources.

Methodology involved

- For breaking stable emulsions and suspensions, EC is a viable alternative to metal salts, polymers, and polyelectrolyte addition.
- An electrolytic cell with one anode and one cathode makes up an EC reactor. The EC system is made up of two parallel pairs of conductive metal plates that operate as monopolar electrodes.

- The criteria for using EC are as follows:
  - A power source that uses direct current
  - Box of Resistance
  - Multimeter

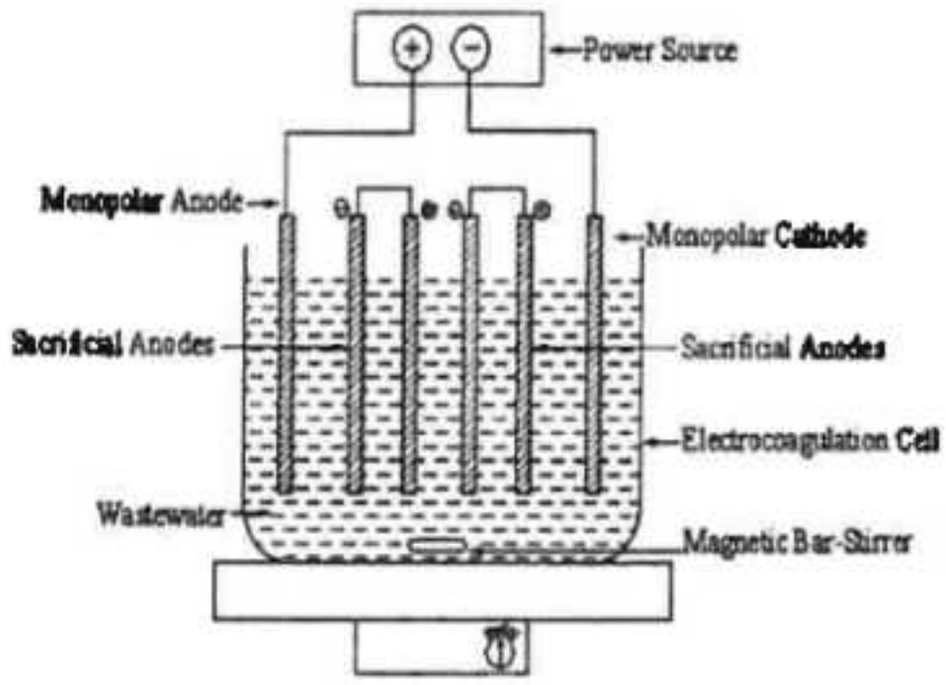

Fig 1: Bench-scale EC reactor with monopolar electrodes in series connection

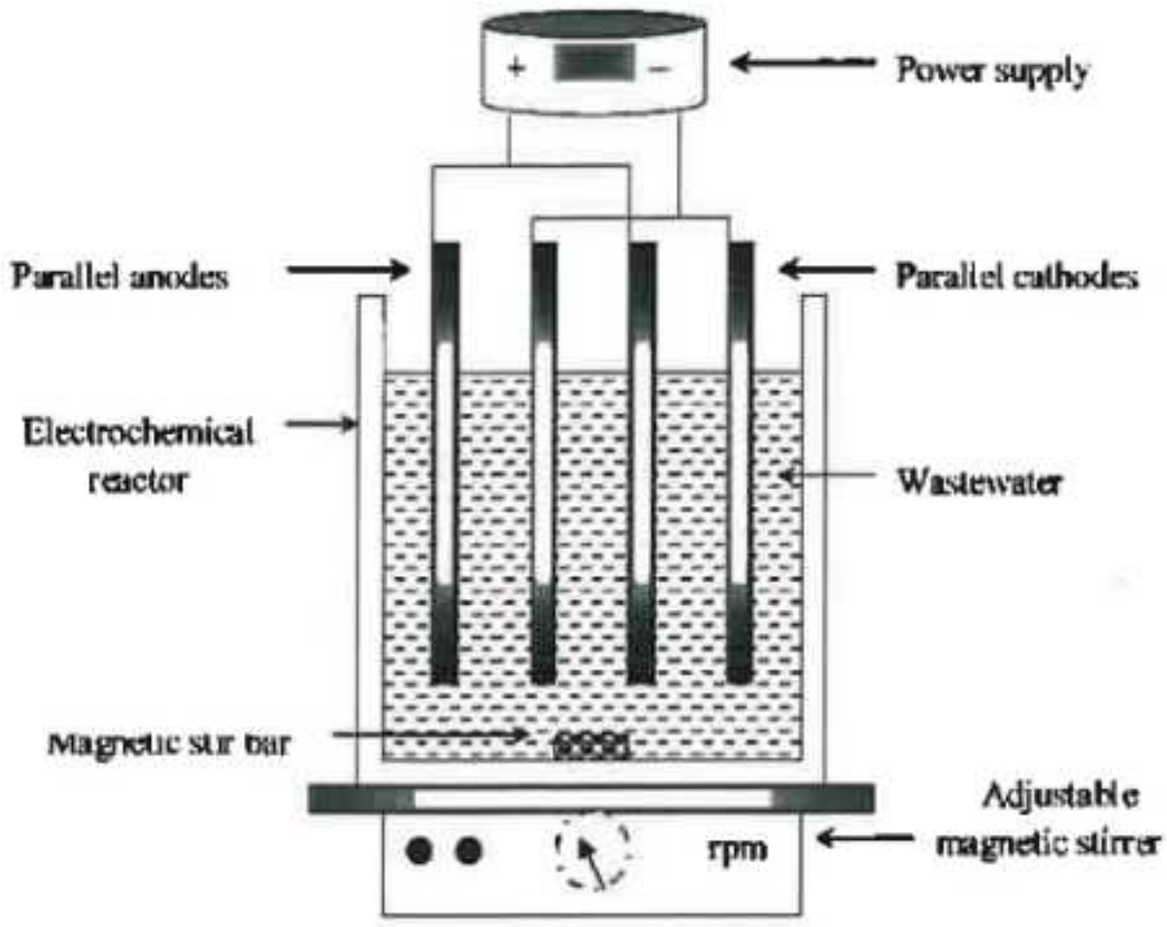

Fig 2: Bench-scale EC reactor with monopolar electrodes in parellel connection

1. "Sacrificial electrodes" is a term used to describe the conductive metal plates. The sacrificial anode decreases the anode's dissolving potential and reduces the cathode's passivation. The materials used for the sacrificial anodes and cathodes might be the same or different.

2. The cells can be connected to monopolar electrodes in a series. or in parallel.
   The cells connected in series have higher resistance, so bigger potential difference is required for a given current to flow in a series cell configuration. The cells connected in parallel have lower resistance, so lesser potential difference is required for a given current to flow in a series cell configuration.

   During electrolysis, anodic reactions occur on the positive side, whereas cathodic reactions occur on the negative side. The coagulation process will begin with released ions neutralizing the charges of the particles.

3. The released ions eliminate undesired impurities by forcing colloidal materials to agglomerate, which can then be removed by flotation. When water containing colloidal particles, oils, or other pollutants passes through an electric field, ionization, electrolysis, hydrolysis, and the generation of free radicals can occur, altering the physical and chemical characteristics of the water and contaminants. Contaminants are liberated from the water and destroyed or rendered less soluble due to the reactive and excited condition.

   Reactions in an EC cell

   At Anode
   $2Al - 6e = 2AL^{3+}$

   At Cathode
   $6H_20 + 6e = 6OH^- + H_2$

   Within the Cell
   $2Al^{3+} + 6OH^- = 2Al(OH)_3$

Gawar Construction Limited Dehradun
INI DESIGN STUDIO PVT. LTD. AHMEDABAD

Conclusion

- **Electrocoagulation** is capable of treating wide range of wastewaters. It is the technique of using a little amount of electrical current to destabilize suspended, emulsified, or dissolved pollutants in an aqueous media. As a result, the process's extra expenses are reduced.

- When it comes to the advantages, the EC method aids in the elimination of TSS by 95-99%, BOD by 50-99%, and bacteria by 95-99%. This shows that the technology is successful and dependable for a wide range of future uses, providing hope for everyone to have access to clean water.

INI DESIGN STUDIO PVT. LTD. AHMEDABAD

SECTION III

UNIT SIZING AND TECHNICAL DESCRIPTION OF VARIOUS UNITS

3.1 Inlet Chamber

Quantity	1 No.
MOC	Civil
Effective Volume	1.6M3
HRT at normal flow	3 minutes
HRT at peak flow	1 minute, 30 seconds
Dimensions in mm	900(L)X1800(W)X1500(LD)+300(FB)
Use	Holding heavy material such as pebbles, metal lids etc

3.2 Coarse Bar Screen Chamber

Quantity	1 No.
MOC	Civil
Effective Volume	2.3M3
Dimensions in mm	2900(L)X800(W)X1500(LD)+450(FB)
Use	Fixing of Coarse Screen

3.3 Fine Bar Screen Chamber

Quantity	1 No.
MOC	Civil
Effective Volume	2.3M3
Dimensions in mm	2900(L)X800(W)X1500(LD)+600(FB)
Use	Fixing of Fine Screen

3.4 Coarse Screen

Quantity	1 working + 1 standby
MOC	SS 304
Dimensions in mm	800 x 2000
Slit or pore size of screen	10 mm approx.
Angle of Inclination	55° to 60°
Head Loss	150mm
Use	Screening of large particulate from raw sewage

3.5 Fine Screen

Quantity	1 working + 1 standby
MOC	SS 304
Dimensions in mm	800 x 2000
Pore Size of screen	6mm approx.
Angle of Inclination	55° to 60°
Head Loss	150mm
Use	Screening of fine particulate from raw sewage

3.6 Grit Chamber

Quantity	1 No.
MOC	Civil
Effective Volume	1.1M3
HRT at normal flow	120 seconds
HRT at peak flow	60 seconds
Dimensions in mm	900 x 900 x 1500
Use	Collection of particle that skips the fine screen (sand etc)

3.7 Oil & Grease Chamber

Quantity	1 No. (divided into two parts)
MOC	Civil

Gawar Construction Limited Dehradun

INDESIGN STUDIO PVT. LTD. AHMEDABAD

Dr. Abid Ali Khan
Principal Investigator
Deptt. of Civil Engineering
Jamia Millia Islamia
New Delhi - 110025

	Effective Volume	7.5M3
	HRT at normal flow	15 minutes
	HRT at peak flow	7 minutes 30 seconds
	Dimensions in mm	2900 x 1800 x 1500
	Use	Separation of oil and aqueous phase
3.8	**Oil Skimmer**	
	Quantity	1 No.
	MOC	Standard
	Capacity	Capable of extracting 50 lph of oil
	Motor capacity	0.37KW, 3P, Geared motor
	Belt size	1200 mm length and 15 mm width, MOC PP
	Use	Extraction of remaining oil from O & G trap
3.9	**Collection/Equalization Tank**	
	Quantity	1 No.
	MOC	Civil
	Effective Volume	250M3
	HRT for normal flow	8 Hrs and 30 minutes (Aerated thru Blowers)
	HRT with peak load	7 Hrs
	Dimensions in mm	9500 x 6030 x 4350 + 500mm FB
	Use	Collection and equalization of influent raw sewage
3.10	**Twin Lobe Air Blower**	
	Quantity	2 working + 1 standby
	MOC	Standard
	Capacity	110M3/Hr at 0.6 bar pressure
	Motor capacity	5.5KW, 3P
	Make	Everest, Model No. M44 or equiv.
	Use	Complete with MS base, antivibration pads, V belt, pulleys, NRV, pressure gauge, filling oil etc Providing air to collection tank to maintain aseptic conditions, EC reactors, flash mixers, sludge holding tank etc. for agitation
3.11	**Air Grid in Collection Tank**	
	Quantity	1 set
	Pipe MOC	GI and CPVC of varied sizes as required for headers, manifolds and connections to diffusers Coarse diffusers 150 mm dia, EPDM disc type diffusers
	Quantity of diffusers	1 set
3.12	**Raw Sewage Transfer Pumps**	
	Quantity	2 working + 1 standby
	MOC	Standard, submersible cutter pumps
	Capacity	30M3/Hr, 15 M head, with low & high level sensors
	Motor capacity	5.5KW, 3P
	Make	KBL, Model Eterna 5500CW or equiv
	Use	Complete with MS lowering & lifting frame, NRV, pressure gauge, valves etc. Lifting of raw sewage from collection tank to EC reactors at desired flow and height
3.13	**Acid/Alkali Dosing system**	
	Dosing Pumps	

Gawar Construction Limited Dehradun

INI DESIGN STUDIO PVT. LTD. AHMEDABAD

	Quantity	1 working + 1 standby
	MOC	Standard, Electronic dosing pumps
	Capacity	0-10 lph, 4 M head (Dose Subject to the site condition)
	Motor capacity	80 W, 1P
	Make	Milton Roy (Asia LMI)
		Complete with PU flexible pipe, inlet & outlet NRV's Dosing
	Tanks	
	Quantity	1 No
	MOC	HDPE
	Capacity	100 Ltr
	Make	Sintex
	Mixing	Agitation by air
	Use	The dosing system will be used to dose acid or alkali to the sewage to adjust pH to almost neutral if required
3.14	**Electrolyte (NaCl) Dosing system**	
	Dosing Pumps	
	Quantity	1 working + 1 standby
	MOC	Standard, Electronic dosing pumps
	Capacity	0-10 lph, 4 M head (Dose Subject to the site condition)
	Motor capacity	80 W, 1P
	Make	Milton Roy (Asia LMI)
		Complete with PU flexible pipe, inlet & outlet NRV's
	Dosing Tanks	
	Quantity	1 No.
	MOC	HDPE
	Capacity	100 Ltr
	Make	Sintex
	Mixing	Agitation by air
	Use	The dosing system will be used to dose electrolyte to the sewage to adjust conductivity to approx. 100uS if reqd.
3.15	**Electrocoagulation Reactors**	
	Quantity	6 Nos, all working
	Effective volume	3.6 M3
	Dimensions in mm	3000 x 1000 x 1200 + 300 mm weir with EC treated water collection tank, complete with outlet weirs, valves etc
	MOC of tanks	MS FRP coated from inside and epoxy coated for outside
	HRT for each EC unit	30 minutes minimum
	Number of Anodes	26 Nos
	MOC of Anodes	Aluminium
	Size of Anodes in mm	800 x 700
	Number of Cathodes	26 Nos
	MOC of Cathodes	Iron
	Size of Cathodes in mm	800 x 700
	Voltage applied	12 V, DC
	Current density at each Electrode	2 mA/cm2
	Electrode configuration	Parallel
	AC Step down transformer & DC Rectifier	AC Transformer 240 V AC to 12 V AC Rectifier 12V AC to 12V DC, 12 A, 3.5 KW
3.16	**Flash Mixers**	
	Quantity	3 Nos.

Gawar Construction Limited Dehradun

INI DESIGN STUDIO PVT. LTD. AHMEDABAD

MOC	MS EP
Effective Volume	4.0M3
HRT	20 minutes (Wastewater Engg, Metcalf & Eddy)
Dimensions in mm	1000 x 2000 x 2000
Mixing	Agitation by air
Use	Mixing of Poly electrolyte for coagulation process

3.17 **Poly Electrolyte Dosing System**

Dosing Pumps	
Quantity	3 working + 3 standby
MOC	Standard, Electronic dosing pumps
Capacity	0-10 lph, 4 M head (Dose Subject to the site condition)
Motor capacity	80 W, 1P
Make	Milton Roy (Asia LMI)
	Complete with PU flexible pipe, inlet & outlet NRV's
Dosing Tanks	
Quantity	1 No.
MOC	HDPE
Capacity	100 Ltr
Make	Sintex
Mixing	Agitation by air
Use	The dosing system will be used to dose polyelectrolyte to the EC treated sewage for floc formation of the sludge toe ease the settling process

3.18 **Tube Settlers**

Quantity	3 Nos.
MOC	MS EP
Length of settler	2062 mm
Width of settler	1300 mm
Total Height of settler	3100 mm
Height of legs	500 mm
Qty of tube deck media(TDM)	2M3
Surface area available	22M2
In tube deck media	
Angle for installation of TDM	60°
	Dimensions in mm details dimensions in tube settler calculation sheet
Use	Gives the required surface area for settling of sludge

3.19 **Chlorine Dosing System**

Dosing Pumps	
Quantity	1 working + 1 standby
MOC	Standard, Electronic dosing pumps
Capacity	0-10 lph, 4 M head (Dose Subject to the site condition)
Motor capacity	80 W, 1P
Make	Milton Roy (Asia LMI)
	Complete with PU flexible pipe, inlet & outlet NRV's
Dosing Tankss	
Quantity	1 No.
MOC	HDPE
Capacity	100 Ltr
Make	Sintex
Mixing	Agitation by air

Gawar Construction Limited Dehradun

INDESIGN STUDIO PVT. LTD. AHMEDABAD

	Use	Dosing of Sodium Hypochlorite in the Filter Feed/Chlorine Contact tank to attain 2ppm of residual free chlorine in treated water
3.20	**Filter Feed/Chlorine Contact Tank**	
	Quantity	1 No.
	MOC	Civil
	Effective Volume	52.4M3
	HRT	95 minutes
	Dimensions in mm	4675 x 2800 x 4000 + 500mm FB
	Mixing	Agitation by air
	Use	This tank collects the treated water & act as a relay tank for water to be fed to the filters. It also acts as chlorine dosing tank.
3.21	**Filter Feed Pumps**	
	Quantity	2 working + 1 standby
	MOC	Standard CI, Horizontal centrifugal pumps
	Capacity	30M3/Hr, 28 M head, with low & high level sensors
	Motor capacity	5.5KW, 3P
	Make	KBL, Model KDS/GMC 844+ or equiv
		Complete with MS base frame, antivibration pads, NRV, pressure gauge, valves etc.
	Use	Feeding of treated sewage to the PSF and ACF at desired flow and pressure
3.22	**Pressure Sand Filter**	
	Quantity	1 No.
	Filtration velocity	10M3/Hr
	MOC	MS EP
	Dimensions in mm	2000 dia x 1800 HOS, both side dish ends, 1manhole and one hand hole
	MS sheet thickness in mm	HOS-6mm, dish ends-8mm, flanges-8mm
	Frontal Piping	MSEP/GI, 65NB,
	Valves	5Nos 63NB butterfly control valves, 1 No 1" air release valve
	Media	Graded sand-3800 Kgs
	Filter vessel	Fabricated
	Valves make	Zoloto
3.23	**Activated Carbon Filter**	
	Quantity	1 No.
	Filtration velocity	10M3/Hr
	MOC	MS EP
	Dimensions in mm	2000 dia x 1800 HOS, both side dish ends, 1 manhole and one hand hole
	MS sheet thickness in mm	HOS-6mm, dish ends-8mm, flanges-8mm
	Frontal Piping	MSEP/GI, 65NB,
	Valves	5Nos 63NB butterfly control valves, 1 No 1" air release valve
	Media	Supporting media pebbles-500 kgs, Granular activated carbon-1600 Kgs
	Filter vessel	Fabricated
	Valves make	Zoloto
3.24	**Filter Backwash Pumps**	
	Quantity	1 working + 1 standby

Gawar Construction Limited Dehradun

INI DESIGN STUDIO PVT. LTD. AHMEDABAD

	MOC	Standard CI, Submersible centrifugal pumps
	Capacity	45M3/Hr, 15 M head, with low & high level sensors
	Motor capacity	3.3KW, 3P
	Make	KBL, Model KDS/GMC 515+ or equiv
		Complete with MS base frame, anti vibration pads, NRV, pressure gauge, valves etc.
	Use	Back washing of PSF and ACF at desired flow and pressure
3.25	**UV Sterilizer Unit**	
	Quantity	1 No.
	MOC	SS-316
	Capacity	for water flow of 30M3/Hr
	UV Dose	60,000 uW-sec/cm2
	UV Transmission per cm	80%
	Voltage	220-240V
	Wattage	1370W
	Make	Alfa
	Model	WL12
3.26	**Filtered Water Tank**	
	Quantity	1 No.
	MOC	Civil
	Effective Volume	86M3
	HRT	2 hrs and 30 minutes
	Dimensions in mm	5200 x 3800 x 4350 + 500mm FB
	Use	This tank collects the final treated & filtered to send to drain/re use/ horticulture etc, Chlorine is also dosed in this final water to achieve 2ppm of residual free chlorine in final treated water
3.27	**Sludge Transfer Pump**	
	Quantity	1 working + 1 standby
	MOC	Semi Open impeller pump
	Capacity	15M3/Hr, 15 M head, with low & high level sensors
	Motor capacity	5.5KW, 3P
	Make	KBL, Model SP1H or equiv
		Complete with MS base frame, anti vibration pads, NRV, pressure gauge, valves etc.
	Use	Transfer of sludge from settlers to sludge holding tank
3.28	**Sludge Holding Tank**	
	Quantity	1 No.
	MOC	Civil
	Effective Volume	31M3
	HRT	1 hrs
	Dimensions in mm	2750 x 2800 x 4000 + 500mm FB
	Mixing	Agitation by air
	Use	This tank collects the sludge received from the settlers and is used as sludge thickner also, apart for feed tank to filter press
3.29	**Filter Press Feed Pump**	
	Quantity	1 working + 1 standby
	MOC	CI body, SS 304 shaft, Screw pump
	Capacity	5M3/Hr, 50 M head
	Motor capacity	3.3KW, 3P

Gawar Construction Limited Dehradun

INI DESIGN STUDIO PVT. LTD. AHMEDABAD

	Make	Roto, Model RLAB541 or equiv Complete with MS base frame, anti vibration pads, NRV, pressure gauge, valves etc.
	Use	Screw type pump is suitable for transfer of semi solids, slurries etc and therefore it is used for feeding of sludge from sludge holding tank to filter press

3.30 **Filter Press**

Quantity	1 No.
MOC	CI mounting structure and PP recessed plates/plate frame
Size of plates	24" x 24"
No. of plates and frames	23
Type of operation	Hydraulic
Sludge Holding Capacity	290 Ltrs in one load
Calculation for sludge generation:	
BOD	300 mg/L
Sludge generation in BOD x 0.5	
Flow/Day	600 KLD 6,00,000 m3/Day
BOD/Day	300 x 600000 180,0.00,000 mg 180 Kgs
Sludge generated	180 x 0.8 **144 Kgs/Day** Selected Filter press of capacity 290 Kgs per lot

3.31 **Sludge Holding Area**

Quantity	1 No.
MOC	Civil
Dimensions in mm	6000 x2825 x300, open space
Use	This space is meant for storing the wet cake of sludge from filter press till disposal, it can take 16 loads (290Ltr x 16 loads) of sludge output from filter press.

3.32 **Platform for EC Reactors**

Quantity	1 No.
MOC	Civil structure
Dimensions in mm	12975 x 6530 at a height of 4500
Use	Civil structure for placing of EC reactors along with walking and working space

3.33 **Platform for Flash Mixers and Settlers**

Quantity	1 No.
MOC	Civil structure
Dimensions in mm	6000 x 6530 on a platform of 250mm height
Use	Civil structure for placing of flash mixers and settlers along with walking and working space

3.34 **Electro Magnetic Flow Meter**

Quantity	2 Nos.
MOC	Standard, Sensor SS
Pipe connections	80mm, flange type
Bore	Full bore
Power	Battery operated

Gawar Construction Limited Dehradun

INI DESIGN STUDIO PVT. LTD. AHMEDABAD

	Type	Flow Indicator, transmitter, flow totalizer, Backlit display, aluminium frame for glass mounting, factory calibrated
	Make	Micro Flow
3.35	**pH Meter**	
	Quantity	2 Nos.
	MOC	Standard, Sensor glass
	Pipe connections	20mm, threaded
	Power	240 V AC from the electrical control panel
	Type	pH range 0-14, digital LED display, Online installation, factory calibrated
	Make	Aster
3.36	**Pressure Gauges**	
	Quantity	Set
	MOC	SS, glycerine filled
	Dial size	4"
	Range	0 – 7 kgs/cm2
3.37	**Level Sensors/Controllers**	
	Quantity	Set
	MOC	Standard
	Type	Float Type NO/NC circuit
	Range	low and high limits adjustable
3.38	**Pipes, Fittings and Valves**	
	Quantity	Set
	MOC	CPVC, GI and MSEP
	Size	Variable sizes of pipes, fittings and valves will be used in the piping system depending upon the flow and pressure requirements at that point
3.39	**Electrical Control Panel**	
	Quantity	1 Set IP 55 LT panel with all incoming and outgoing feeders as per the capacity of the instruments. All feeders shall have overload, short circuit and phase reversal protection. Required PLC and starters etc will be the part of the panel.Incomer feeders shall multifunctional meters, CT's, push buttons and indicating lamps. Panel shall be supplied as per specifications and requirements for auto operation of the sewage treatment plant with manual over rides. Earthing shall be provided for each electrical instrument with GI strip or GI wire as required at the specific place. All power and control panels (from panel to the individual electrical instrument, termination of cables and cable trays (inside the STP) are considered in this item. All cables wires etc will be wrapped with PP/PU insulation sheets.
3.40	Antifreeze Flexible Heating Cables	Antifreeze flexible heating cables will be installed with the CPVC piping system tied by PP cable ties

SECTION IV
DESIGN CALCULATIONS

4.1 Calculation for Coarse Screen

No. of Bars in bar Screen

Width of Bar Screen	800	mm
Effective Length of bar screen	1300	mm
Bar spacing	10	mm
Bar width	40	mm
Total width used by each bar	50	mm
Total Nos. of bars	16	mm
Available spacing width wise	150	mm
Total area available for water flow	195000 mm2	0.195 m2

Approach Velocity at Bar Screen

A = Flow/Velocity

Peak Flow of water	60	M3/Hr
	0.017	M3/Sec
Min. Reqd Approach velocity	0.3	M/Sec
Cross section reqd for desired approach velocity	0.056	M2

Channel dimensions before bar screen: 1800mm (L) X 200mm (W) x 300 mm(H)

Length of the channel is less due to space constraint

Head loss thru the screens

$h = .0729(V^2-v^2)$

h	Head loss in metre
V	flow velocity thru the screen in m/s
Factor	0.0729
V	0.3 m/s
V^2	0.09
V	0.017 m/s
v^2	0.000289
V^2-v^2	0.09
H	0.01 m< 150 mm hence Ok

Head Loss taken is 150mm as standard practice as per CPHEEO, Chapter 5, Section 5.6.1.8 &5.6.1.9

4.2 Calculation for Fine Screen

$h = (1/2g)(Q/CA)^2$

Discharge Flow in M/sec Q		0.017	M3/sec
Coefficient of discharge C		0.6	
Effective submerged open area A	0.4M x 0.6M	0.24	M2
Gravity		9.8	M/Sec^2
2g	9.8 x 2	19.6	
1/2g		0.05	
CA		0.144	
Q/CA		0.12	
(Q/CA)2		0.014	
Head Loss H		0.0007	

Head Loss taken is 150mm as standard practice as per CPHEEO, Chapter 5, Section 5.6.1.9

4.3 Calculation for Grit Chamber

Settling Velocity		
Vs = g (Ss-1) d2		
18 μ		
Gravity g	9.8	
Specific Gravity of grit Ss	2.65	
Particle size of grit d	0.15	mm
	0.00015	M
g/18	0.544444444	
Ss-1	1.65	
d2	2.25E-08	
Viscosity	0.00000114	
d2/μ	0.019736842	
Vs	0.017730263	M/sec
Reynolds Number R = Vs x d/μ	2.332929363	
	2.3>0.5 Hence Stoke law doe not apply	
Applying transition law for 0.5 < R < 103		
Vs = [0.707 x (Ss-1) d1.6 - v-0.6]0.714	0.0168	M/sec 1451.52
Computation of Surface Overflow rate		
Surface overflow rate for 100% removal Efficiency in an ideal Grit Chamber = Settling velocity of minimum size of particle		
Convert Vs to M/day	1451.52	M3/m2/day
Determine actual overflow rate		
n = 1 - {1+nVs/Q/A}-1/n		
Assuming η= 0.75 and n = 1/8 then		
Q = Vsn	959	M3/m2/day
A (1- η)-n -1		
Flow per day	600	KLD
flow per hour/60 minutes Q		
Determine of Dimension of grit chamber	30	M3/Hr
Plan area of grit chamber = Q	0.031282586	M2
Q/A		
Proposed a grit chamber of dimensions	**900mm x 900mm x 1500mm**	
As per CPHEEO manual page No. A-112 critical		

Gawar Construction Limited Dehradun

INI DESIGN STUDIO PVT. LTD. AHMEDABAD

displacement velocity for above parameters Vc	0.161	m/sec
As per CPHEEO manual Horizontal velocity Vh should < Vc		
assuming depth of 900mm Vh	1.20689E-06	

Ref: CPHEEO manual appendix 2, page No. A-111 to A-113

4.4 Calculation for Oil & Grease Trap

Flow per day	600	KLD
Effective working Hours	20	HRS
flow per hour/60 minutes	30	M3/HR
Retention time for removal of oil and grease	15	MINUTES
Min. Volume of oil & grease trap required	**7.5**	M3

4.5 Calculation sheet for Equalization/Collection tank

Flow per day	600	KLD
Effective working Hours	20	HRS
flow per hour/60 minutes	30	M3/HR
Peak load flow (2 times of normal flow in M3/Hr)	60	M3/HR
Retention time for collection tank	8	HRS
Min. Volume of collection tank required	240	M3

Ref: Wastewater Engg. Metcalf & Eddy, CPHEEO Manual. 5,Sec. 5.6.3

4.6 Calculations for EC Reactor

Electro Coagulation Calculator by Faradays Law

$$m = \frac{E \times i \times t}{96485} \quad \text{or} \quad i = \frac{m \times 96485}{E \times t} \quad \text{or} \quad \text{Watts } W = \frac{m \times 96485 \times \text{Voltage } V}{E \times t}$$

CPHEEO, Chapter 5, Section 5.7.3.2

4.8 Calculation for Tube Settler

Calculation for Tube Settler

Flow per day	200	KLD	
Flow of effluent/Hr.	10	M3/Hr	Q
Settling Velocity of effluent	10	M/Hr	V
Angle of inclination	60	degree	
Area in per M3 of Tube deck	11	M2	
Factor for Tube deck media	19		
M3 of Tube deck media	1.727	M3	
Add 10% extra	1.90	M3	
Tube deck Media required in L			
Ht of Tube deck media	1.00	M	
Length & Width required for fixing Tube deck media			
Width of settler	1.30	M	
Length required	1.46	M	
Size required for fixing tube deck media	1.5 x 1.3 x 1	LWH in M	
Height of settler			
Free port top	500	mm	
Inlet Chamber	800	mm	
Free port bottom	300	mm	
Height of Chamber	1500	mm	
Height of cone	500	mm	
Height of legs	500	mm	
Total Height of Tube settler	**3600**	**mm**	
Difference in ht of Inlet and outlet chamber	300	mm	
Length of components of settler			
Inlet chamber	300	mm	
Outlet chamber	300	mm	
Length of media chamber & cone	1461.54	mm	
Total Length of Settler	**2061.54**	mm	
Width of components of settler			
Inlet chamber	1300	mm	
outlet chamber	1300	mm	
Cone	1300	mm	
Main body	1300	mm	
Total width of settler	**1300**	mm

ELECTRICAL LOAD, AUTOMATION LOGIC, EQUIPMENT WEIGHTS

5.1 Electrical Load

Electrical Load Data Sheet

S.No.	Equipment name	Qty in Nos	KW per unit	Total Electrical Load in KW
1	Oil Skimmer	2	0.37	0.74
2	Air Blowers	3	5.5	16.5
3	Sewage Transfer Pumps	3	5.5	16.5
4	Dosing Pump for Acid	2	0.08	0.16
5	Dosing Pump for NaOH	2	0.08	0.16
6	Dosing Pump for NaCl	2	0.08	0.16
7	Electro coagulation unit	6	3.5	21
8	Poly Dosing System	6	0.08	0.48
9	Chlorine Dosing System	2	0.08	0.16
10	Filter Feed Pump	2	5.5	11
11	Filter Backwash Pump	2	3.7	7.4
12	Screw pump	2	2.2	4.40
13	Filter press, Hydraulic	1	3.7	3.7
	Total Connected Electrical Load			**82.36**

5.2 Automation Logic

1. **Collection tank**
   a) The Sewage transfer pumps will stop if the level in the collection tank is low and will restart as soon as the level reaches high.
   b) The blower will continue working even at low level. Needs to be stopped manually

2. **Electrolysis Reactors**
   a) The DC Circuit will trip as soon as the level in the reactor tank gets low and will restart when the level reaches high.
   b) Low level in the reactor tank will also trigger the sewage transfer pump to start if the level in the collection tank is sufficient.
   c) Low level in Reactors will also stop agitation in flash mixers.

3. **Filter Feed Tank**
   a) Filter feed pump will trip if water in the filter feed tank is low and will restart on sensing high level.

4. **Treated Water Tank**
   a) In case level in the Treated Water Tank is sensed high, whole plant will stop including the DC power supply of the Electrolysis reactors and the Dosing system.
   b) The blower will continue working. Plant will restart at low level in Treated water tank.

5. **Manual Overrides**
   a) Manual override will be provided for all the automation. In case the plant is run in manual mode all automation systems will cease to work.
   b) All working and standby equipment have a selector switch to manually switchover to the desired equipment if required.
   c) An emergency switch will be provided in the panel to completely cut off power supply to the complete unit.

7.2 Air Blower

ROOTS BLOWERS

AIR COOLED SERIES

EVEREST TWIN LOBE ROTARY AIR COMPRESSORS

A complete range of Standard Blowers is available for flow rates from 25 m3/hr through 7,000 m3/hr in single stage and upto any capacity in parallel configurations, for working pressures upto 1 kg/cm2. They are available as total package units, ready to install or as bare blower units for replacement.

Our technology is so flexible, we can custom manufacture "Special Air Blowers" by alloying and cross linking diverse designs to suit individual requirements and import substitutes.

STANDARD DESIGN AND CONSTRUCTION FEATURES

- 100% oil free air delivery.
- Factory engineered, factory guaranteed, superior product.
- Alloy steel hardened and ground timing gears.
- Anti-friction bearings.
- Rotary oil sealings.
- Rigid one piece CI casing and side plates.
- Horizontal and vertical configurations available.
- Easy rotor timing setting.
- No vanes, valves or rings to wear.
- Large inlet and outlet connections for minimum loss.
- Improved volumetric efficiency and reduced operating temperatures.
- Alloy steel toughened shafts ground to close tolerances.

APPLICATIONS

- ***Water Treatment Plants*** For backwashing of filter/mixed beds.
- ***Effluent Treatment Plants*** For diffused aeration and agitation of effluent.
- ***Cement Plants*** For Blending, Aeration, Fluidization, Conveying.
- ***Aquaculture*** For maintaining the dissolved Oxygen level.
- ***Chemical Plants*** For supplying of process air.
- ***Electroplating Plants*** For Oil Free air agitation of electrolyte.
- ***Paper Plants*** Knife edge coating, Drying, Conveying, Vacuum pickup.
- ***Yarn Drying*** Vacuum/Pressure Drying of Yarn.
- ***Vacuum Moulding*** For creating quick vacuum.
- ***Polyster Chip Conveying & drying*** For transfer of polyster Chips and other similar materials.
- ***Bag Filters*** For reverse cleaning of Filter bags.
- ***Pneumatic Conveying*** Vacuum, Pressure and Combination Conveying of cereals, cement, husk, baggase, granules, powders and other similar material.
- ***Regeneration of Dryers & Molecular Sieves.***

THE EVEREST ADVANTAGE

Retain your advantage with factory genuine replacement parts.

- All parts meet original manufacturing specifications and tolerances for guaranteed fit and function.
- Pre-packaged overall kits with detailed service manuals are available on request.

WE JUST DON'T OFFER BLOWERS, WE OFFER SOLUTIONS!

EVEREST transmission

PRODUCT RANGE

Air Blowers – Water Cooled Blowers – Gas Blowers – Vacuum Booster Pumps – Acoustic Hoods & Enclosures – Dry Vane Pumps

7.3 Sewage Transfer Pump

KIRLOSKAR PUMPS

ETERNA CW

SEWAGE DE-WATERING SUBMERSIBLE PUMPS

TECHNICAL SPECIFICATION	
Head Range	: Upto 78 Metres
Discharge Range	: Upto 4800 LPM
Power Rating	: 0.75 to 15 KW (1 to 20 HP)
Voltage Range	: 380 to 440 Volts (Three phase)
pH Value	: 6.5 to 7.5
Maximum Density	: < 1050 kg/m³
Protection	: IP 68
Consistency of Medium	: < 1.2 x 10³ kg/m³
Maximum Ambient Temperature	: 40 °C
Insulation	: "B"/ "F" Class.

MATERIAL OF CONSTRUCTION	
Impeller	: Cast Iron
Delivery Casing	: Cast Iron
Motor Body	: Cast Iron
Pump Shaft	: Carbon Steel

APPLICATIONS

- Sewage pumping
- Dewatering from basements, multi-storeys, shopping malls, godowns
- Construction site
- Dewatering foundation, trenches and pits
- Flood water handling

High Efficiency and Energy Saving Design
Innovative design manufactured at state of art plant, delivers optimum efficiency at lower energy consumption resulting in significant cost savings.

Easy Maintainable Designs
Easy maintainable design and better interchangeability of components so that pump can be serviced even at remote locations by semi-skilled technicians.

Robust Construction
Heavy duty construction made from graded cast iron, carbon + silicon carbide mechanical seal makes the pump suitable for sewage and sludge.

Replaceable Wearing Parts
All wearing parts within the pumps are easily accessible and replaceable which facilitates ease of maintenance thereby extending the life of the pump.

Dynamically Balanced Rotating Parts
Minimum vibrations protect components from damages during the operations, thus ensuring consistent performance as concentricity is maintained.

NOTE: KDS+ As compared to KDS-813+ on 13 meter, KDSGMC 125+ also has an enhanced water output over KDS-813+, 50/65 mm. KDS-216+ + can also be used in deep wells upto 95 ± 5 m. As pump consumes 2 HP can be operated under varying water conditions for medium cost of petrol pump set up than the conventional. During 2 HP range KDS-216+ + to KDS-225+ + are supplied with coupling less arrangement for petrol pump set. KDS-2030+ is supplied with coupling less arrangement for petrol pump set.

KS+ Stainless steel version is also available on request. Above KS+ monoblocs can be supplied with coupling less arrangement for petrol pumpset or monoblocs less agricultural pump sets. As KS+ pumps except KS-1012+ are ISI marked.

Performance is applicable for water at a specific gravity 1 and kinematic viscosity of water.

Gawar Construction Limited Dehradun

7.8 Electromagnetic Flowmeter

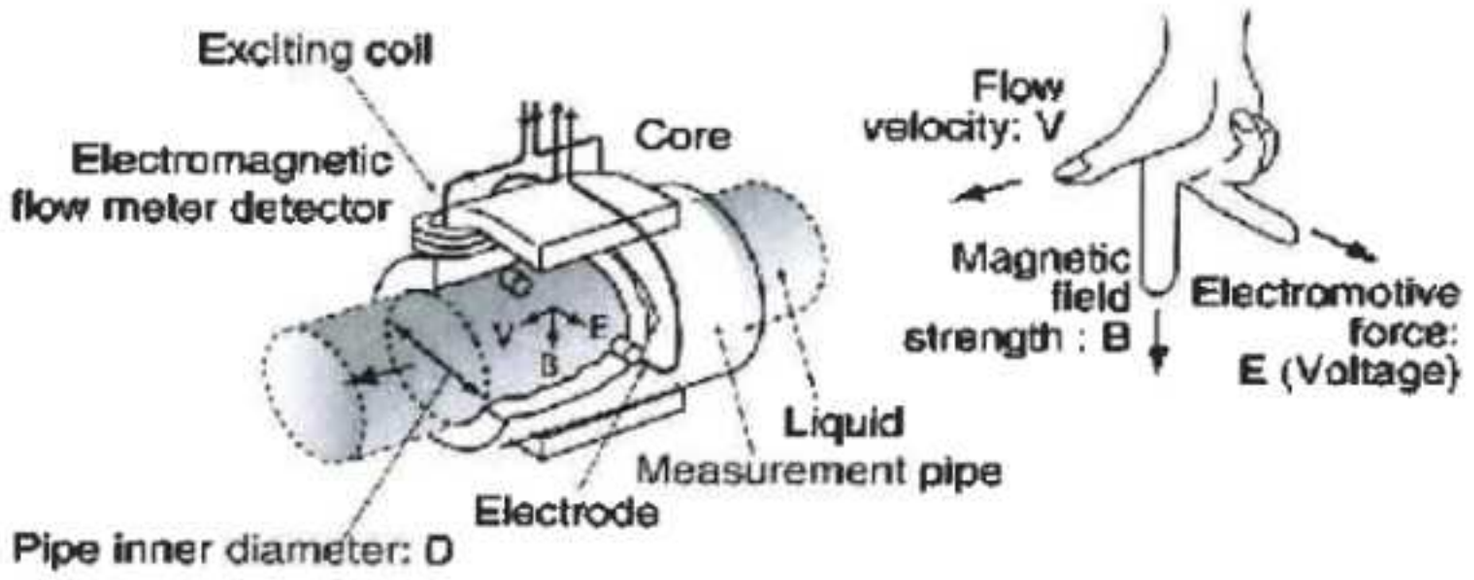
PRINCIPLES

Electromagnetic flow meters detect flow by using Faraday's Law of induction.

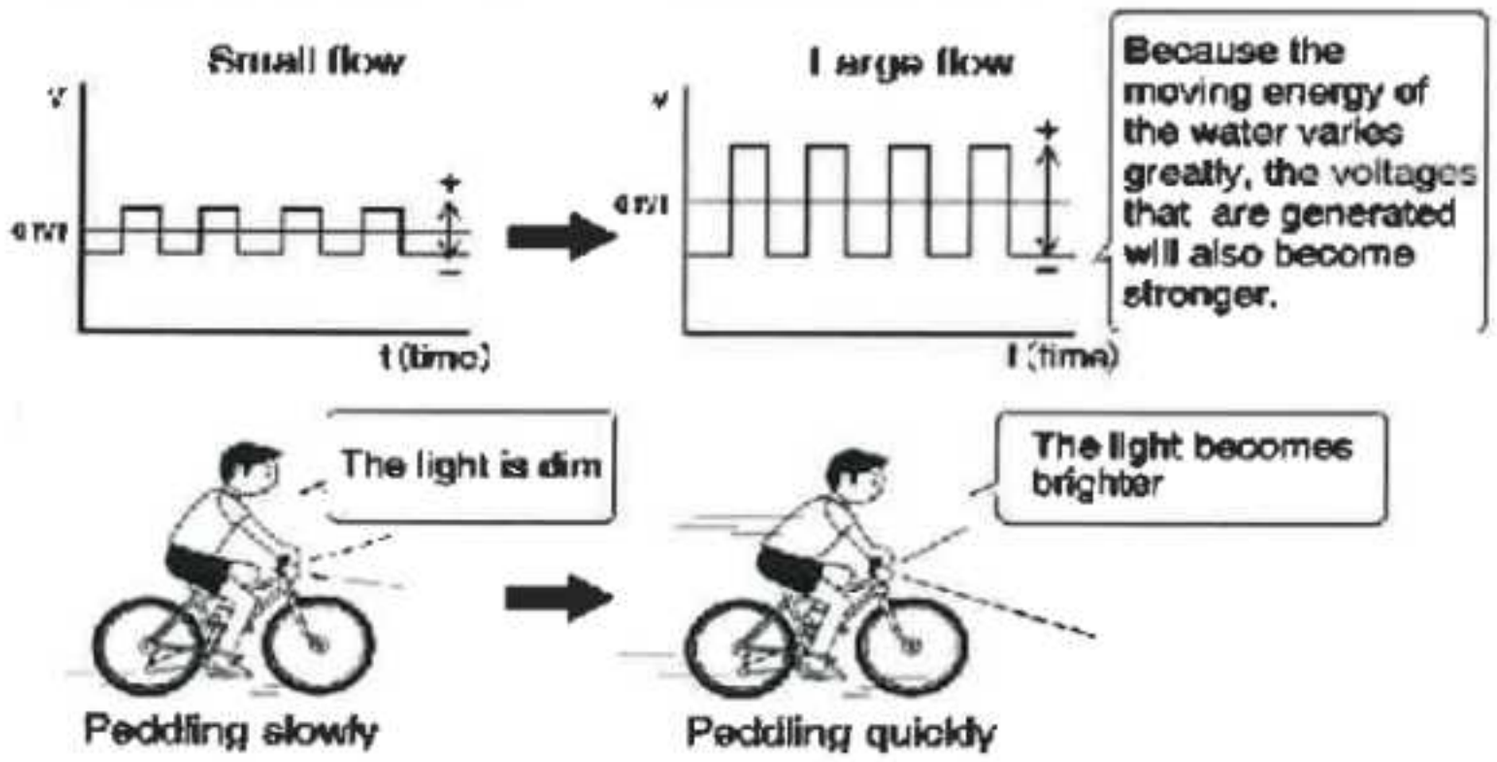
Inside an electromagnetic flow meter, there is an electromagnetic coil that generates a magnetic field, and electrodes that capture electromotive force(voltage).

Due to this, although it may appear as if there is nothing inside the flow pipe of an electromagnetic flow meter, flow can be measured.

Under Faraday's law of induction, moving conductive liquids inside of a magnetic field generates an electromotive force (voltage) in which the pipe inner diameter, magnetic field strength, and average flow velocity are all proportional. In other words, the flow velocity of liquid moving in a magnetic field is converted into electricity. (E is proportional to V × B × D)



As the flow changes, the electromotive force (voltage) captured by the electrodes changes as follows.



Gawar Construction Limited

7.9 pH Meter

pH/ORP METER

EMBARK
SENSE MEASURE CONTROL

pH is the measure of the hydrogen ion concentration in a liquid. pH measures the acidity or alkalinity of a liquid. The pH scale is logarithmic and runs from 0.0 to 14.0 with 7.0 being neutral. Readings less than 7.0 indicate acidic solutions, while higher readings indicate alkaline or base solutions.

Chlorine and Ozone are the most common disinfectants used in the water and waste water treatment industry. Oxidation-reduction potential (ORP) is the parameter commonly used to measure REDOX reactions and is the only practical method we have to electronically monitor disinfectant effectiveness.

PO 650 pH/ ORP

PO 650 pH/ORP with LCD

WHY CHOOSE THIS METER

- **TRACEABILITY?** to NABL/ SRL standards
- **PUSH BUTTON FRONT KEYS** for easy set up
- **INDIVIDUAL HIGH & LOW SET POINT RELAY** for alarm or signal to PLC or can be used for proportional acid/alkali dosing
- **PROGRAMMABLE CONTROL DELAY TIME TO PREVENT CHATTERING**
- **HYSTERISIS TO PREVENT RELAY CHATTERING** Hysteisis is the percentage of set point below which relay will reset after getting energized
- **IN-BUILT DIAGNOSTICS** for wrong calibration or sensor error
- **IN-BUILT ALARM ANNUNCIATOR** It's a facility to acknowledge high/low fault condition and reset relays by pressing the acknowledge key
- **MANUAL/AUTOMATIC** relay reset options

ADVANCED OPTIONS AVAILABLE:

- **AUTOMATIC TEMPERATURE COMPENSATION**
- **DUAL LINE BACKLIT LCD** which displays temperature and pH/ORP along with relay status
- **RS 485** for online monitoring/ data logging
- **ISOLATED 4-20 mA OUTPUT** with normal/inverse function and in-built current simulator

APPLICATIONS

Mineral Water Plants · Beverage Industry · Liquid Waste Management · Pharma & Chemical · Pulp & Paper Industry · Swimming Pool

Dear Sir.

This is with reference to the vetting of 18 EC technology based STPs of Uttarakhand. Earlier we had sent 18 reports excluding the performance of EC Reactor. Now we are ready with 10 days performance analysis report of the pilot plant we had installed at IIT Delhi. Plant performance is now satisfactory and consistent. Find enclosed herewith vetting of Electrocoagulation technology for sewage treatment.

Thanking You,

Sincerely Yours,

Vivek Kumar

Gewar Construction Limited
Dehradun

Introduction

A pilot scale electro-coagulation plant has been installed at the IIT Delhi premises for the purpose of performance analysis and process optimization. 1 m^3/hr plant is installed at micro-model premises near an open unconstructed (Kachha Nala) drain. Drain carries the domestic waste water of Katwaria Sarai village, and IIT Delhi's staff colony. Units of the plant were transported from Coimbatore (M/s Confident Engineering) and installed on a concrete platform. A flowchart of the pilot scale plant shown in fig 1.

The primary focus of the study was to analyze performance of the plant with respect to selected parameters and further optimize the performance as per the targeted values of the selected parameters. Targeted values of the various parameters are shown in table 1. These values are the discharge norms as per the DNIT and Contract.

Table 1: Treated water parameters as per contract

S. No.	Parameter	Values
1.	pH	6.7-7.0
2.	TSS, mg/L	<10
3.	BOD, mg/L	<10
4.	COD, mg/L	<50
5.	Total Kjeldahl Nitrogen (as N) mg/L	<10
6.	Ammonia Nitrogen (as N) mg/L	<5
7.	Total Phosphorous (as PO_4) mg/L	<2
8.	Fecal Coliform Count (MPN)	<100

Before the installation of plant, survey of drain and sampling of wastewater was carried out at various point and time to observe variation in parameters to ease the plant operation. Based on the study it is found that peak flow and pollutant load occur at two times in a day, 8:00-10:00 AM in the morning and 8:00-10:00 PM in the evening. Sampling at Nala was done for 24 hours at the interval of 2 hours. Wastewater parameters were analyzed in CRDT, IIT Delhi following standard methods (table 2). The characteristics of wastewater flowing in the drain is shown in table 3. For the treatment purpose wastewater is being pumped from kaccha Nala, upstream (u/s)

(about 20-30 m from the plant) to 3000 L storage tank by a 1 HP pump having 14 m^3/hr rated capacity and 8 m head. Pump is placed at the bank of the Nala. From the collection tank wastewater flows through the treatment plant by gravity and pump. Finally treated water is being used for gardening purposes. Pilot scale plant is being run at various daytimes on batch basis from morning 6 am to evening 10 pm to study the impact of variation in the flow and pollution load rate on the treatment performance of the plant. The treatment plant based on electrocoagulation technology consisted of EC reactor, followed by online ozone dosing. lamella clarifier. MGF. and ACF. Detailed design parameters of the pilot plant after modification are presented from tables 4a to table 4c.

Table 2: Methods and reference used for wastewater parameters

Parameters	Method	Procedure Reference
pH	Used a Labman scientific instrument	-
COD (mg/L)	Closed Reflux method	5220 B
BOD (mg/L)	Winkler method	5210 B
TSS (mg/L)	Filtration method	2540 D
Total phosphorus (as PO_4)	Colorimetric test	4500-PD
Fecal Coliform (MPN)	-	9221 B-C

Table 4: Analysis of Drain wastewater

Parameters	Range (Average)
pH	6.5-7.2 (6.85)
COD (mg/L)	190-362 (332)
TSS (mg/L)	170-400 (310)
TDS (mg/L)	800-1100 (1030)
EC (µs)	1330-1650 (1200)
Fecal coliform (MPN)	5.60-9.80 x 10^4 (820 x 10^4)

Table 4 (a): Equalization tank

Descriptions	Parameters
Volume of the tank	0.5 m^3
Retention time Actual/design @ 1 m^3/h	30 min
Retention time peak (Assuming peaking factor 3)	10 min
Ozone applied in equalization tank	
Rate of Ozone dosing	3 g/m^3

Table 4 (b): Electro-Coagulation tank detailed description

Description	Value
Design flow	1 m^3/h
Peak flow (Assuming peaking factor 3)	3 m^3/h
Dimension (L*W*d) of the EC tank (meter)	0.465*0.390*0.903
EC tank Volume	0.1637 m^3
One plat Dimensions (L*W*thickness) (meter)	0.6*0.3*0.004
One plate one side surface area	0.18 m^2
Total one plate surface area	0.36 m^2
Total number of electrodes	53 No's
Gaps between two electrodes	5 mm
Total volume occupied by electrodes	0.03816 m^3
EC tank effective volume	0.12554 m^3
Current	6 amp
Optimum power range	300-500 watts
Optimum energy density range	15.72 – 26.20 (watts/total surface area m^2)
Total plats surface area	19.08 m^2
Retention time Design	7.5324 min
Retention time Peak	2.51 min
Maximum electrodes consumption	10 g/ m^3(m^3 of sewage)

Table 4 (c): Other Pilot scale plant unit's capacities

Descriptions	Parameters
Flash Mixer Tank Dimension Volume	0.6*0.54*0.7
Flash Mixer Tank Volume	0.2268 m^3
Lamella Tube settler dimensions	4.18 m^3
Area	3.05 m^2
Angle	55
MGF and ACF Dimensions	1.450 m Height and 0.5 m diameter
Area	0.196 m^2

Methodology:

After initial performance analysis on the basis of COD, SS, and TDA it was found that plant was neither stable nor performing as per the set targets. Further detailed design of the plant was

Jawar Construction Limited Dehradun

Dr. Vivek Kumar
Associate Professor
Centre for Rural Development & Technology
Indian Institute of Technology Delhi
Hauz Khas, New Delhi-110016, INDIA

studied and after discussion with M/s Confident Engineering, process optimization study was carried out to achieve discharge norms and stable performance of the plant. Parameters chosen for, optimization study were Power density, gaps between electrodes, location of ozone treatment, change in the angle of Tube settler media.

Results and Discussion:

Electro coagulation unit was run at 6 Amp constant current using iron electrodes plates with varying power density 13.10-26.20 (watts/ m^2). Tube settler media was adjusted at different angles varying from 45-60°. Angle 55° is found more suitable for proper particle settlement, the same is described in literature also. Location of ozone treatment has a significant impact on pollutant removal efficiency, ozone treatment was tried at two different locations keeping dosing rate constant, (i) after tertiary treatment (MGF and ACF) and (ii) before EC treatment. Ozone treatment before EC reactor has shown significant pollution reduction efficiency, therefore ozone treatment was continued before EC reactor for further work. The gap between two electrodes was varied -4 mm gap (58 No's plates), 5 mm gap (53 No's plates), 6 mm and 10 mm gap (39 No's & 24 No's plates) and uniformity of space electrodes was also maintained. 5 mm gap was found suitable as it enhance contact between wastewater and electrodes, which leads high performance. Lesser gap was not found suitable probably due to the fact that very low gap creates problems in cleaning which leads low performance. Higher gap is not found suitable too, probably it results in poor contact between wastewater and electrodes. After optimization of all the above variables, electrode gap was fixed at 5 mm. Tube settler media at 55°, and Ozone-treatment location at before EC and then optimization of power density was carried out by varying it from 13.10-26.20 (watts/ total surface area m^2) keeping current constant at 6 amp. Range of power density 15.72 – 26.20 watts/total surface area m^2 was found achieving almost similar result. At the optimum conditions outlet parameters were found under target limits. After optimization study plant performance was studied for 10 days continuously and the results are presented in table 5. It is clear from the results that now plant is performing well and achieving treated water quality targets shown in table 1.

Centre for Rural Development & Technology
Indian Institute of Technology Delhi
Hauz Khas, New Delhi-110016, INDIA

Table 5: Analyzed parameters of pilot scale EC plant

Parameter	Inlet Range (Average)	Outlet range (Average)
pH	7.15-7.34 (6.85)	7.25-7.39 (7.3)
COD (mg/L)	190-362 (332)	28-48 (36)
BOD (mg/L)	70-270 (240)	8-9.7 (8.6)
TSS (mg/L)	170-360 (290)	7.5-13.5 (9.5)
Total phosphorus (as PO_4)	4.6-5.8	0.9-1.7 (1.5)
Fecal Coliform (MPN)	$5.60\text{-}9.80 \times 10^4$ (8.20×10^4)	80-95 (84)

Recommendation:

Following are the recommendation for the implementation in all the 18 plants to be installed:

1. Ozone treatment should be done before EC reactor
2. Plate spacing in EC reactors should be kept at 5 mm.
3. EC plants need to be operated at the energy density range from 16-26 Watt/total plate surface area m^2.
4. Angle of the media in lamella clarifier should be kept around 55^o
5. Polishing treatment

Conclusion: The EC based treatment plant in IIT Delhi is performing consistently now. The retention time of EC reactor is much lower than any biological reactor with better plant performance. Therefore the foot print of EC based treatment system will be much lower than conventional treatment system. The treatment system also reduces fecal coliform significantly due to the ozone addition. It is also reported in the literature that ozone is a better option for disinfection as compare to conventional disinfection treatment technologies.

Gewar Construction Limited
Dehradun

1. Introduction:-

This report concerns with the design assumptions considered while designing proposed various STP buildingsin Uttarakhand. This report includes design philosophy and various loadings taken into account while modeling and designing different structural members. The substructure and upto plinth level the building is of RCC and above it the building is of structural steel. For fast construction the contractor has agreed to procure steel tanks for various treatment processes.

2. Design philosophy and modeling:-

The building had been designed as framed structure and modeling hadbeen done using finite element based software ETABS v9.7.4. Column and beam elements had been modeled as frame elements while slab had been modeled as shell element. Foundation had been considered fixed at least 1.2m below stilt for foundation resting on soil and at least 300mm for footing resting on rock. To incorporate the cracked section properties of concrete members the following property modifiers had been considered while modeling:
Column - 0.7; beam - 0.35 and slab - 0.25.

Since the building is in earthquake prone area, ductile detailing as per IS-13920 had been followed.

3. Soil:

Safe bearing capacity of soil has been considered asper the concerned building soil report.

4. Material Properties:

Concrete: M-25; E_c = 25000 N/mm^2; Density = 25 kN/m^3.
Steel: Fe500D; E_s = 2.0E+5 MPa; Density = 78 kN/m^3.
Structural steel – E250 (BR); Bolt grade – 10.9;
Welding electrode (As/ IS 814) – EX41XX with a ultimate stress of 410-510 MPa and a min yield stress of 330 MPa;
Steel deck - 6mm thkchequered plate.

5. Loadings:

This section includes various loading applied on the structure to design various elements.

5.1. Live loads:

STP tank	-	30kN/m^2
Machine area	-	5kN/m^2

5.2 Super imposed dead loads (SIDL):

Decking is of steel chequered plate only painting shall be done to protect from corrosion. Weight of steel deck has been taken while modeling.

Tiwari Construction Limited Dehradun

TECHNICAL CONSULTANCY SERVICES DEHRADUN

5.3 Earthquake loads:

Following parameters has been considered for earthquake loading:

Zone IV; Z = 0.24; Soil type: II; R = 4 (Steel building with ordinary braced frame);

Importance factor = 1.0; Damping (ζ) = 2%.

Calculation of base shear:

$T_a = 0.085 * h^{0.75}$;

Percentage of live load considered for seismic weight is 50%.

5.4 Wind loads:

V_b = 47m/s, $V_z = k1*k2*k3*V_b$; Terrain category – 2; Building class - B

Maximum force = $C_f * A * Pz$.

6. Load combinations:

The following load combinations have been considered for designing structural elements:

A) Limit state of serviceability:
   DL + LL
   DL + EQ
   DL + 0.8 LL + 0.8 EQ
B) Limit state of collapse:
   1.5 DL + 1.5 LL
   1.5 DL + 1.5 EQ
   0.9 DL + 1.5 EQ
   1.2 DL + 1.2 LL + 1.2 EQ

Where, DL is dead load, LL is live load and EQ is earthquake loads.

7. Special notes:

- Since the steel structure is not showing any signs of uplift, 16 diameter holing down bolts have been used.
- Bracing shall be provided to at least two adjacent edges of building.

ABSTRACT

In this study, a pilot test of electrocoagulation (*EC* with aluminium electrodes) of natural municipal wastewater was performed. In view of the obtained results and the unique and innovative nature of the proposed procedures and solutions, *EC* can be regarded not only as a preliminary purification step, but also as a comprehensive alternative to other wastewater treatment methods. Electrocoagulation was conducted at constant current, and changes in voltage were registered continuously to control and calculate energy consumption. After 2 h (7200 s of *EC* + 1800 s of additional sludge settling), initial colour (2140–2570 mg/L) was removed in 86–99.5%, turbidity (87.5–149 mg/L) – in 100%, suspended solids (250–340 mg/L) – in 88.5–91%, COD (609–737 mg/L) – in 60.8–63.5%, and phosphorus (10.0–10.7 mg/L) – in 94.5–96%. As expected, a higher electrocoagulant dose at higher energy consumption improved the efficiency of wastewater treatment, but energy consumption was not directly proportional to the treatment efficiencies of electrocoagulated municipal wastewater. The obtained results of sewage purification seem to be promising both economically and technologically. They fulfil Polish standards of effluent quality, except for COD where higher efficiency is required. *EC* poses a viable alternative to other wastewater treatment methods and should be considered as an initial step in municipal wastewater treatment.

Keywords: Electrocoagulation EC; Al-electrodes; Energy consumption; Sewage

1. Introduction

Biological treatment of wastewater, the most popular sewage treatment method, is characterized by very low efficiency at low temperatures [1–3]. At low temperatures (5–10°C), the efficiency of most biological processes decreases considerably, and the effectiveness of suspended solids, COD and phosphorus removal is reduced significantly. Therefore, a biological purification of wastewater, in cold regions, should be supported such as chemical coagulation or, alternatively, electrocoagulation, which will significantly reduce the loading to biological stages.

Electrocoagulation (*EC*) is easy to control, which is an important consideration in wastewater treatment systems for single houses and portable water treatment units [4,5]. When aluminium electrodes are used, the formation of the aluminium coagulant can be described with the use of the following equations representing the main electrode reactions:

$$2n\,Al^{\circ} - 6n\,e = 2n\,Al^{3+} \quad (1)$$

$$6(n-x)H_2O + 6(n-x)e = 6(n-x)OH^- + (n-x)H_2(\uparrow) \quad (2)$$

The formation of a positively-charged, colloidal aluminium electro-coagulant is described by the following reaction equation:

*Corresponding author.

1944-3994 / 1944-3986 © 2017 Desalination Publications. All rights reserved.

$$2n\,Al^{3+} + 6(n-x)OH^- = \left\{Al(OH)_3\right\}_{2(n-x)} + 2x\,Al^{3+} \quad (3)$$

The above reactions are accompanied by minor oxygen polarization of the cathode (the value of n in the above equations is significantly higher than the value of x), which induces a minor increase in the pH of electrocoagulated wastewater:

$$\frac{3}{2}x\,O_2(\text{from water}) + 6x\,e + 3xH_2O = 6x\,OH^- \quad (4)$$

EC poses an alternative to chemical treatment [6,7], in particular with regard to low transportation costs of Al from Al-electrodes which is nearly 10 times lighter than Al from $Al_2(SO_4)_3{\cdot}18H_2O$. The availability of cheap electricity and/or the addition of seawater to wastewater treated by *EC* could reduce the costs associated with this method [8–10]. Such an approach has already been tested in Norway by Foyn [11]. Surprisingly, Al-Zuhair et al. [12] noted a 10–15% increase in *EC* efficiency when the temperature of treated wastewater was decreased by 15°C, which may suggest that this method is more suitable for cold climate regions. Similarly to coagulation, the main stages of *EC* are destabilization and flocculation of the colloidal system [13–15]. Electrochemical treatment of sewage [16–19] and other types of wastewater, such as baker's yeast [20], chips [21], pulp and paper [22,23], has been widely researched. Under these conditions, wastewater disinfection [24] also by chlorine evolution at the anode [10,19] may be an important part of the electrocoagulation process. During laboratory experiments, a variety of practical improvements have been suggested for the *EC* process to lower the coagulant dose, including: a) wastewater recirculation [25], b) the use of electrodes that are specifically shaped to account for the unique parameters of treated wastewater and c) changes in the direction of current flow [26] for electrode self-cleaning [27].

In this study, selected innovative solutions for sewage EC, which had been previously tested only in a laboratory setting, were analysed in semi-industrial conditions. The following unique solutions were applied in a pilot experiment: a) sewage flow during recirculating *EC* was enforced by the shape of the electrodes and the electrolyser, and the electrolyser can be easily adapted to process large quantities of wastewater, b) electrode self-cleaning was induced by changes in the direction of current flow on the electrodes, c) the optimized frequency of changes in the direction of current flow on the electrodes (every 256 s) was sufficient for electrode polarization. In view of the unique and innovative nature of the proposed procedures and solutions, *EC* can be regarded not only as a preliminary purification step, but also as a comprehensive alternative to other wastewater treatment methods.

2. Materials and methods

Sewage from Reszel (Poland, 5000pe) was used in this pilot test. Raw sewage was characterized by the following average parameters: pH = 6.89–6.97; Turbidity TU = 87.5–149 mg/L, Suspended Solids SS = 250–340 mg/L; Chemical Oxygen Demand COD = 609–737 mg/L; Total Phosphorus P = 10.0–10.7 mg/L. A pilot system for *EC* of municipal wastewater, equipped with Al-electrodes, was designed and constructed specifically for this test. The diagram of a recirculation system for sewage *EC* is shown in Fig. 1.

550 g NaCl was dissolved in 100 L of sewage to increase its specific conductance κ to $2.2{\cdot}10^{-3}$ $\Omega^{-1}{\cdot}cm^{-1}$. Then, 26 mL of concentrated HCl (36%) was added to decrease pH and dissolve the passive layer of the anode [28]. According to some researchers [10,19,24], disinfectant chlorine can be generated electrochemically under the above conditions. Next, 100 L of sewage was recirculated at 200 L/h between the small electrolyser and the large container for 1 h (Fig. 5) or 2 h (Figs. 3 and 4). Nine Al-electrodes with the width of 46 cm, height of 16 cm and thickness of 0.3 cm each, spaced at 2.3 cm, were installed in the glass chamber. This unique arrangement contributed to maximum contact between the electrodes and wastewater (Fig. 1, "6"). The pH in the container was maintained at 6.0 by adding small amounts (14–19 mL) of concentrated (36%) HCl during the process.

EC was conducted at constant current. Changes in voltage were registered continuously (Fig. 2), and the mean value of U was determined for controlling and calculating energy consumption. Programmable power supply for the electro-coagulator and the microcomputer controlling the system (10 and 11 in Fig. 1) changed the direction of the current on the electrodes every 256 seconds (based on the results of previous laboratory tests [27]) to: a) facilitate "sophisticated" self-cleaning of the cathode which became a soluble anode after every 256 s, b) minimize polarization loss. The electro-coagulant dose was proportional to the time of electrolysis according to Faraday's law,

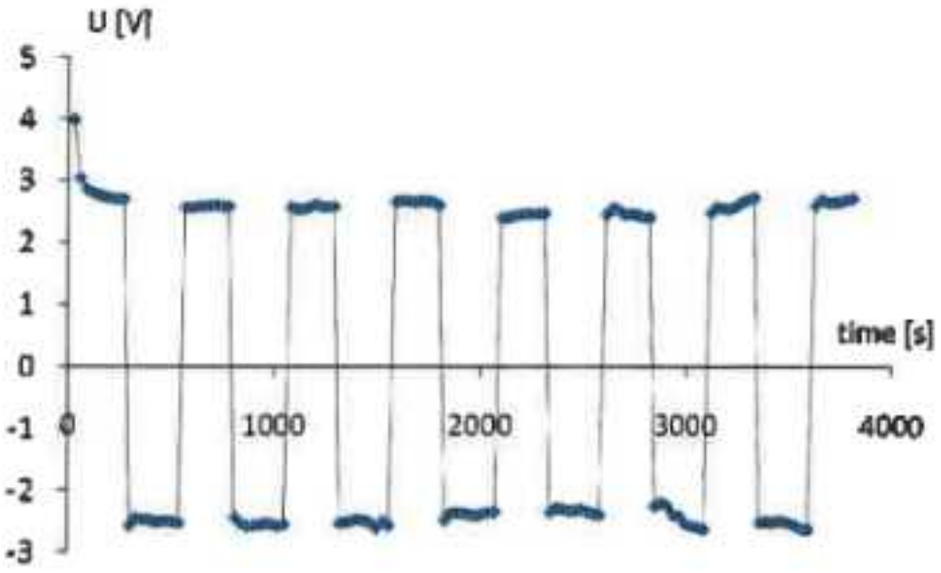

Fig. 2. Example of registration of changes in voltage.

$m = k \cdot i \cdot t$, where the electrochemical equivalent of aluminium is $k = 27/(96500 \cdot 3) = 9.3 \cdot 10^{-6}$ g·A^{-1}·s^{-1}, although previous research [29] demonstrated that it could be higher. Samples for analysis were collected from the supernatant every 10 min. Colour, turbidity (TU), suspended solids (SS), total phosphorus and COD were measured in the DR 2800 HACH-Dr Lange system, and pH was controlled with the Hanna Instruments HI 8424 pH-meter. After *EC*, treated sewage was sedimented for 30 min, and three final samples were collected from the supernatant for analysis. The mean values of parameters describing treated wastewater are given in Figs. 3–5, and the percent error (± %) of SS, P and COD values is presented in Table 1. In Polish wastewater treatment plants, the maximum concentration of phosphorus in purified wastewater is 5 mg/L. Initial phosphorus concentration in the analysed sewage was close to 10 mg/L. Therefore, the common denominator for comparing the obtained purification results was the removal of 50% P.

3. Results and discussion

The purification of re-circulated sewage treated by *EC* with Al-electrodes is shown in Figs. 3–6 as the following relationship:

$$\textit{impurity removal [\%]} = f(\textit{time of electrolysis})$$

The first run of *EC* was performed at I = 10A during t = 2 h (Fig. 3).

During *EC*, aluminium ions formed by electrolytic dissolution of the aluminium anode are transferred to wastewater [Eq. (1)]. Positively-charged colloidal [$Al(OH)_3$] in sewage [Eq. (3)] is gradually bound to wastewater impurities (responsible for the values of TU, SS, P and COD). After aggregation, agglomeration, flocculation and sedimentation of the sewage sludge, the liquid phase of treated wastewater is gradually separated from impurities expressed by the values of TU, SS, P and COD. After 2 h of *EC*, the initial colour (2520) was finally removed in 70.2%, turbidity (148) – in 98%, suspended solids (350) – in 74.3%, and phosphorus (10.0 mg/L) – in 79.1%. The electro-coagulant dose required to achieve the above results was:

$$m = 9.3 \cdot 10^{-5} g \cdot A^{-1} \cdot s^{-1} \cdot 10\ \text{A} \cdot 7200\ \text{s} = 6.7 g\ \text{Al} / 100\ \text{L} \quad (5)$$

According to the data in Fig. 3, less Al (approx. 62.5 mg Al/L) was required (t = 6720 s) to meet the Polish sewage treatment standards with regard to (–50%) phosphorus removal. Unfortunately, the final COD of 289 mg/L (up to 60.8%) did not conform to the Polish requirements, i.e. 150 mg/L. The energy consumption associated with the introduction of 6.7 g of Al to 100 L of treated sewage was:

$$E = 2.65\text{V} \cdot 10\text{A} \cdot 2\text{h} = 53\text{Wh} / 100\text{L} = 0.53\ \text{kWh per tonne of sewage} \quad (6)$$

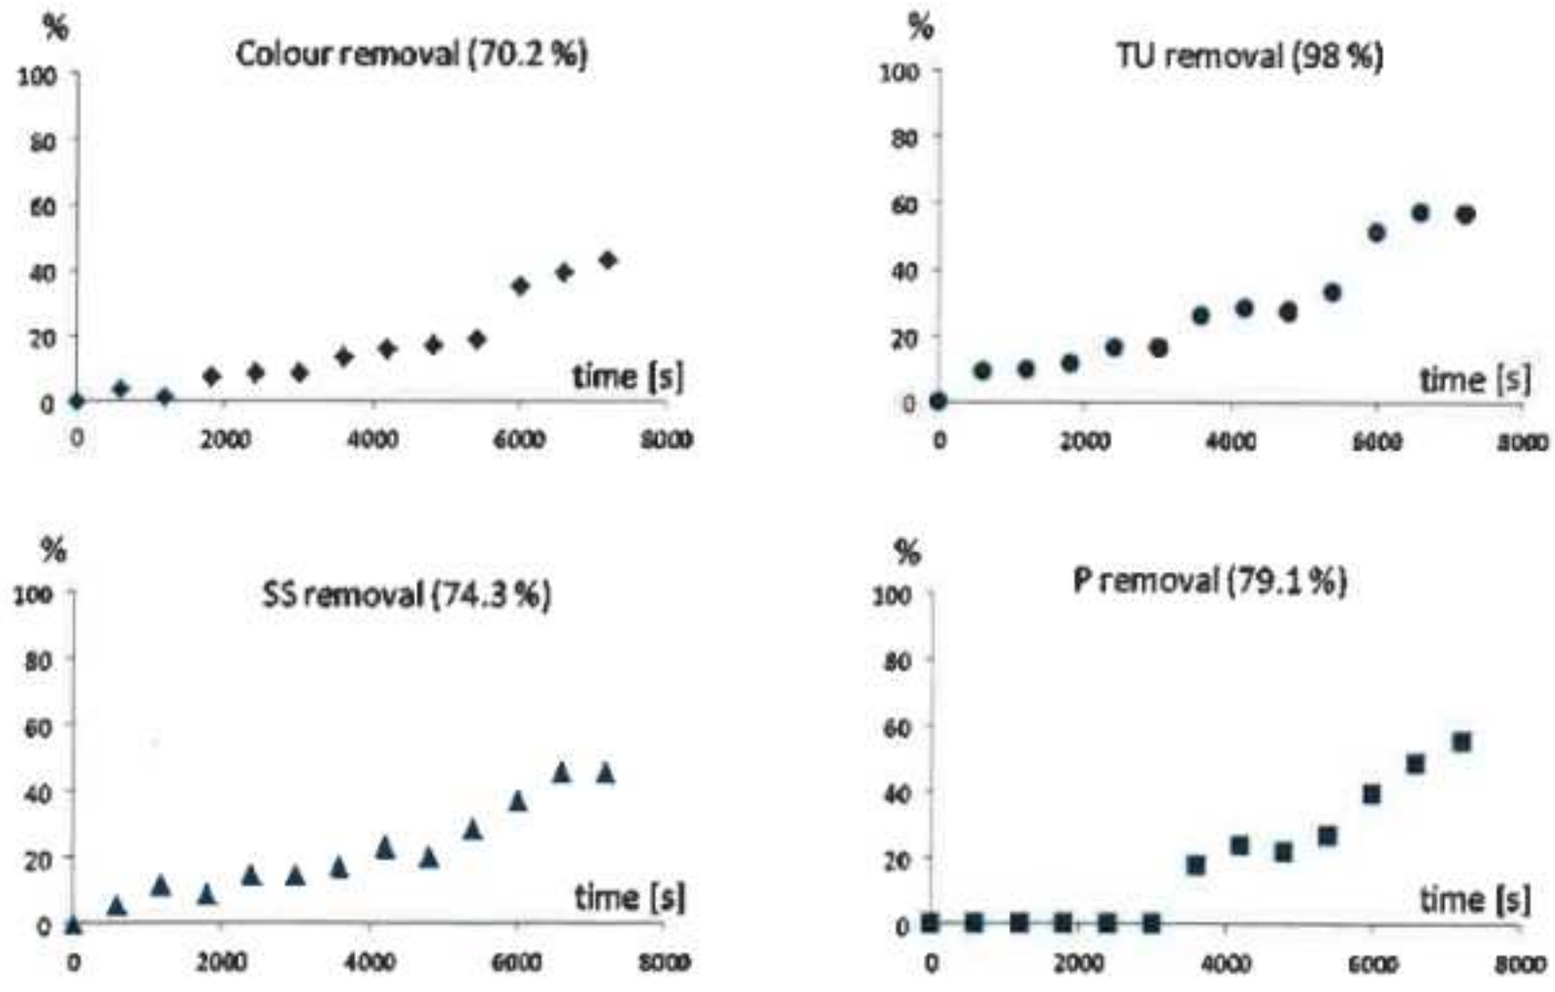

Fig. 3. Purification of sewage treated by *EC* at I = 10 A, U = 2.65 V, t = 7200 s, pH_o = 6.93 + 15 mL HCl, P_o = 10.0, $Colour_o$ = 2520, TU_o = 148, SS_o = 350, $COD_o \rightarrow COD_t$ = 609 → 326 mg/L (–46.5%).

Gawar Construction Limited Dehradun
INI DESIGN STUDIO PVT. LTD. AHMEDABAD

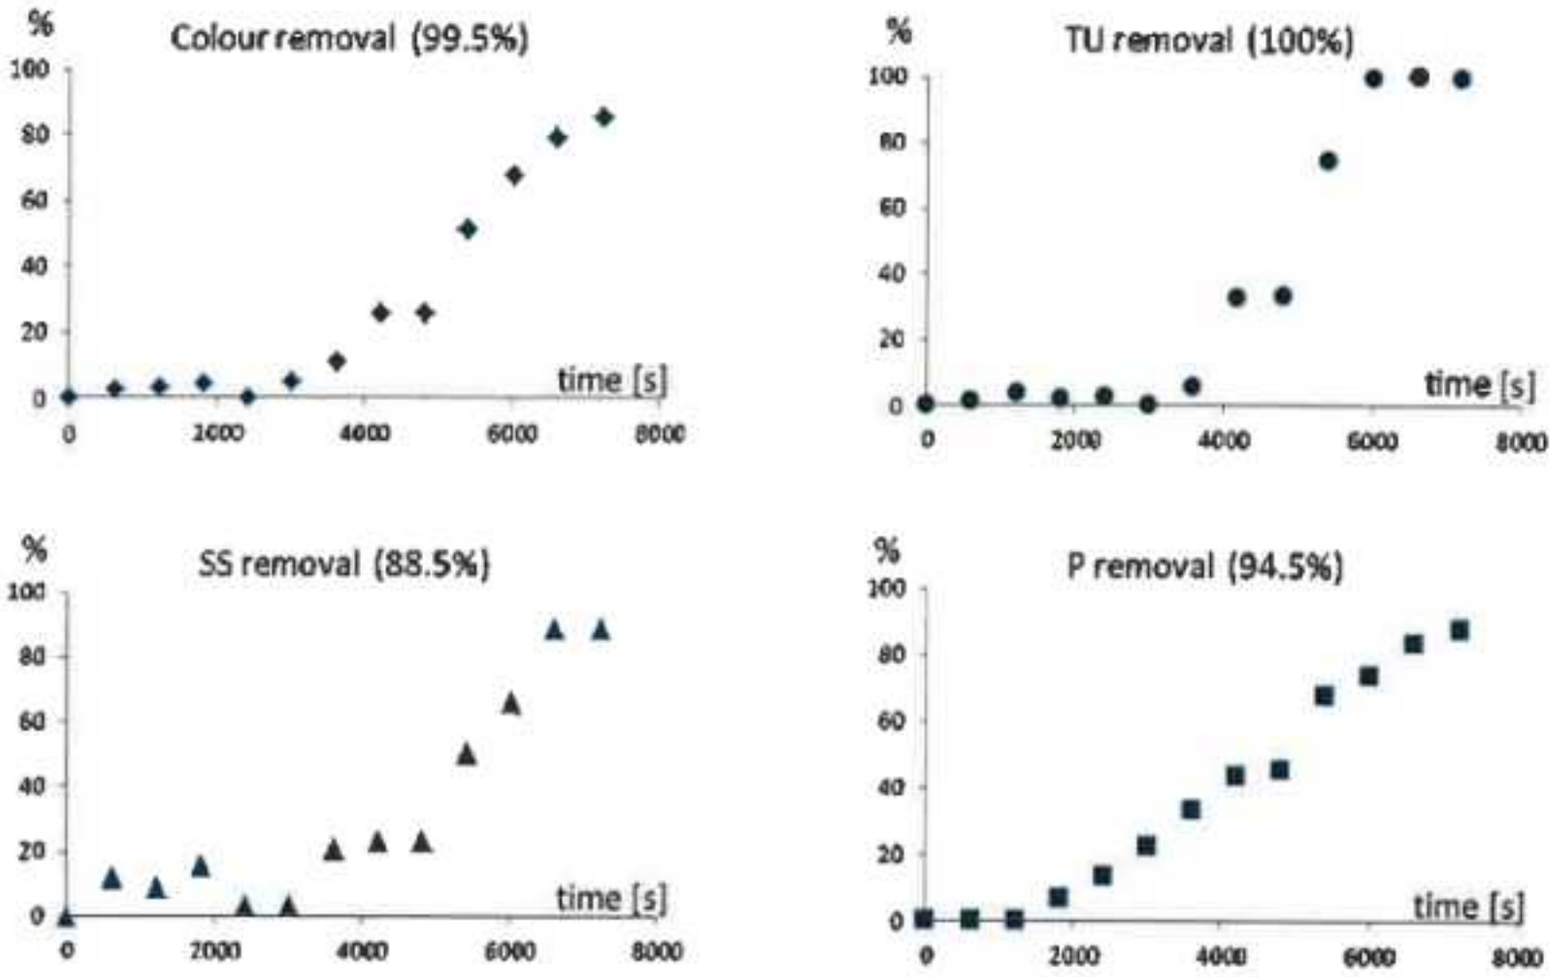

Fig. 4. Purification of sewage treated by EC at I = 13 A, U = 2.8 V, t = 7200 s, pH_o = 6.92 + 14 mL HCl, P_o = 10.7, $Colour_o$ = 2140, TU_o = 87.5, SS_o = 260, $COD_o \rightarrow COD_t$ = 737 → 289 mg/L (–60.8%).

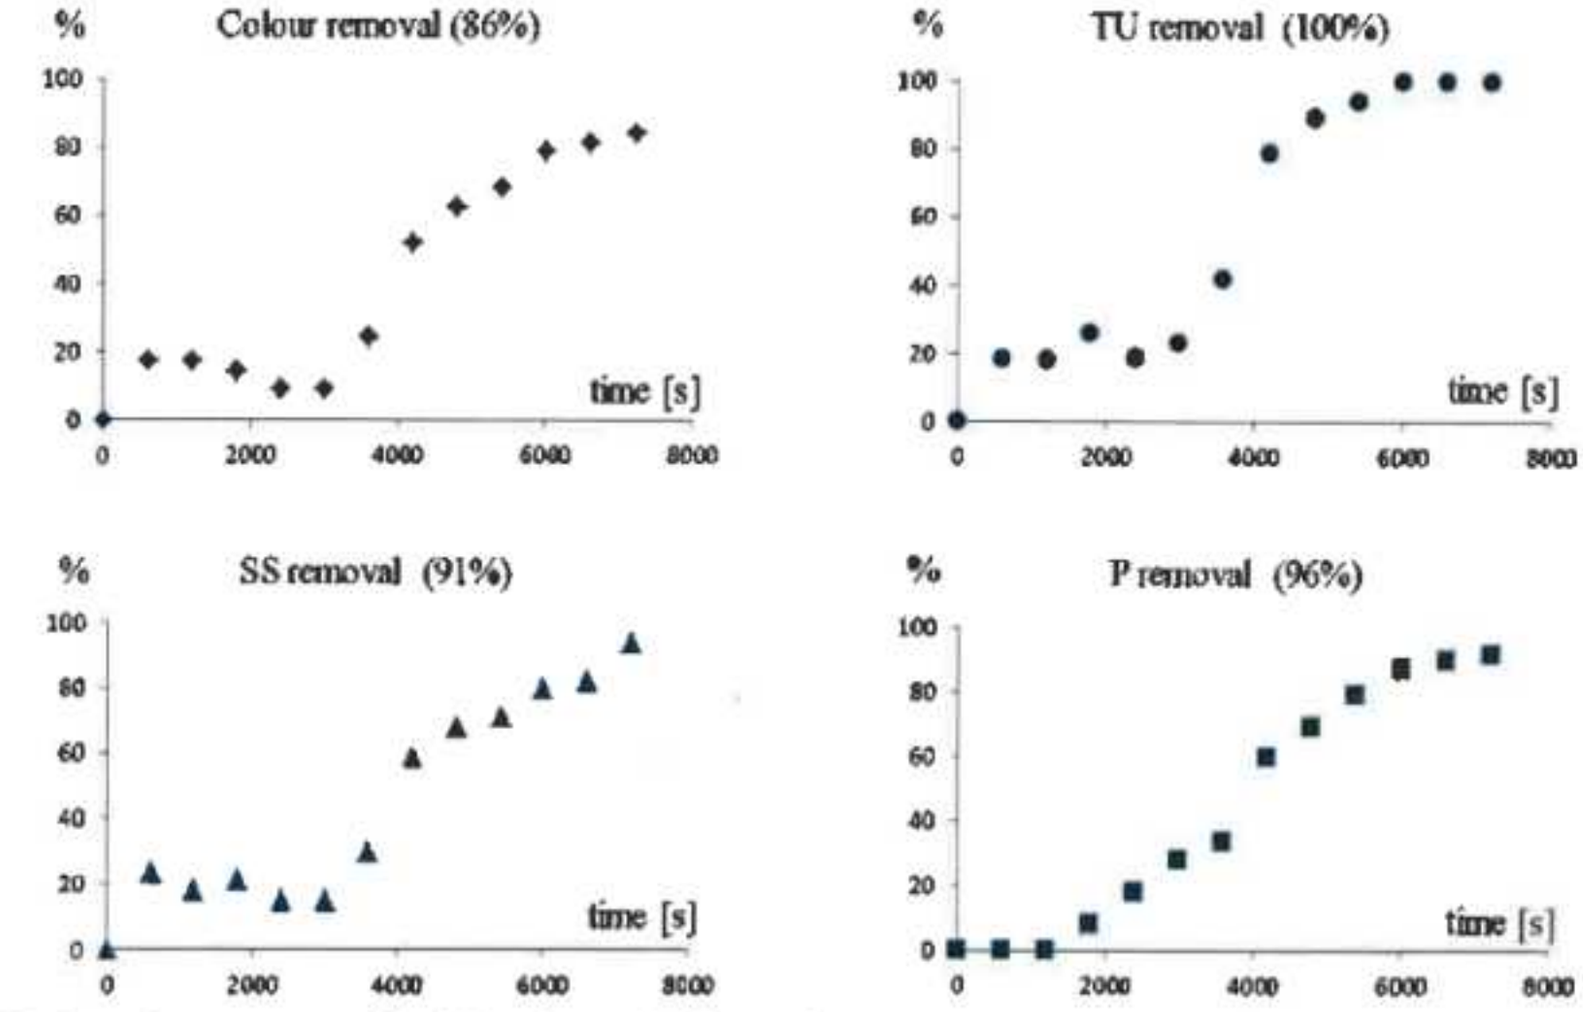

Fig. 5. Purification of sewage treated by EC at I = 15 A, U = 3.2 V, t = 7200 s, pH_o = 6.89 + 15 mL HCl, P_o = 10.7, $Colour_o$ = 2570, TU_o = 149, SS_o = 340, $COD_o \rightarrow COD_t$ = 737 → 269 mg/L (–63.5%).

Table 1
Parameters and results of pilot EC of municipal wastewater

No. of run	Al-dose	Energy consumption	SS	P	COD
	g/tonne	kWh/tonne	[%] removal		
1	67	0.530	74.3 ± 1.2	79.1 ± 4.4	46.5 ± 5.0
2	87	0.728	88.5 ± 1.5	94.5 ± 4.5	60.8 ± 5.5
3	100	0.960	91.0 ± 1.7	96.0 ± 4.3	63.5 ± 1.6

Gawar Construction Limited Dehradun

INI DESIGN STUDIO AHMEDABAD

Therefore, energy consumption required to remove 50% of P was 0.49 kWh per tonne of sewage (62.5 mg Al/L was consumed). Al-anode dissolution and energy consumption are the main costs associated with *EC* maintenance.

The second run of *EC* was performed at $I = 13$ A during $t = 2$ h (Fig. 4). Those parameters (I and t) were selected based on numerous laboratory experiments and trials [29–31].

After 2 h of *EC*, the initial colour (2140) was removed in 99.5%, turbidity (87.5) in 100%, suspended solids (250)– in 88.5%, and phosphorus (10.7 mg/L) in 94.5%. The electro-coagulant dose required to achieve the above results was:

$$m = 9.3 \cdot 10^{-5}\, g \cdot A^{-1} \cdot s^{-1} \cdot 13\ \text{A} \cdot 7200\ \text{s} = 8.7 g\ \text{Al} / 100\ \text{L} \quad (7)$$

According to the data in Fig. 4, less Al (approx. 58.6 mg Al/L) was required ($t = 4850$ s) to meet the Polish sewage treatment standards with regard to (–50%) phosphorus removal. Unfortunately, the final COD = 289 mg/L (60.8% removal) did not conform to the requirements, i.e. 150 mg/L. The energy consumption associated with the introduction of 8.7 g of Al to 100 L of treated sewage was:

$$E = 2.8\ \text{V} \cdot 13\ \text{A} \cdot 2\ \text{h} = 72.8\ \text{Wh} / 100\ \text{L} = 0.728\ \text{kWh per tonne of sewage} \quad (8)$$

Therefore, energy consumption required to remove 50% of *P* at 58.6 mg Al/L was 0.49 kWh per tonne of sewage. It means that energy consumption required to remove 50% of *P* is the same at $I = 13$ A and $I = 10$ A, although less Al was consumed at $I = 13$ A.

In the third run of *EC* (Fig. 5), current was increased to $I = 15$ A.

After 2 h of *EC*, the initial colour (2570) was removed in 86%, turbidity (149) – in 100%, suspended solids (340) – in 91%, and phosphorus (10.4 mg/L) – in 96%. Due to higher $I = 15$ A, the electro-coagulant dose required to achieve the above results was:

$$m = 9.3 \cdot 10^{-5}\, g \cdot A^{-1} \cdot s^{-1} \cdot 15\ \text{A} \cdot 7200\ \text{s} = 10 g\ \text{Al} / 100\ \text{L} \quad (9)$$

According to the data in Fig. 5 and according to expectations (Figs. 3 and 4), less Al (approx. 55.5 mg Al/L) was required to meet the sewage treatment standards with regard to (–50%) phosphorus removal. However, the final COD of 269 mg/L (up to 63.5% removal after EC) did not fulfil the Polish requirements. Similar or even worse results were obtained in numerous laboratory experiments and trials [29–31]. The energy consumption associated with the introduction of 10 g of Al to 100 L of treated sewage was:

$$E = 3.2\text{V} \cdot 15\text{A} \cdot 2\text{h} = 96\text{Wh} / 100\text{L} = 0.96\ \text{kWh per tonne of sewage} \quad (10)$$

Therefore, energy consumption required to remove 50% of *P* (at 55.5 mg Al/L) was 0.53 kWh per tonne of sewage. It means that energy consumption required to remove 50% of *P* at $I = 15$ A was slightly higher than at $I = 10$ A and $I = 13$, but less Al was consumed at $I = 15$ A. Considering the final results of purification (final removal of Colour, TU, SS and *P*, Fig. 5), a compromise between Al-anode dissolution and energy consumption has to be reached.

As expected, a higher electrocoagulant dose at higher energy consumption improved the efficiency of wastewater purification. The data presented in Table 1 indicate that the improvement in the purification degree of electrocoagulated waste may not be cost-effective in practice. When energy consumption is increased by 45% and aluminium consumption (Al electrodes) is increased by 33%, the corresponding increase in removal efficiency (SS, P and COD) is only around 17%. However, operating costs (consumption of Al electrodes and energy) can be adapted to local needs and requirements. One of the greatest advantages of the proposed *EC* method is that it is easy to control by changing the current flowing through the electrolyser.

As mentioned in the Introduction, *EC* and chemical coagulation involve the aggregation, agglomeration and flocculation of impurities with colloidal particles of aluminium hydroxide and other aluminium compounds in the system after the hydrolysis of aluminium cations [32].

The diagram in Fig. 6 presents a simple model for the aggregation and flocculation of phosphates and COD with colloidal $\{Al(OH)_3\}_n$. From the physicochemical point of view, this process involves bridging of positively-charged, colloidal $\{Al(OH)_3\}_n$ adsorbents by negatively-charged sewage impurities, and the adsorption of other wastewater impurities (such as phosphate anions) by colloidal $\{Al(OH)_3\}_n$ adsorbents [30]. In industrial practice, this aggregation mechanism is known as sweep flocculation [15,32]. Sewage impurities are agglomerated in sludge, and sludge is separated to produce treated wastewater.

In the fourth run (Fig. 7), in order to validate the data from purification trials 1, 2 and 3, the duration of the experiment was reduced to 1 h of *EC* at the current of $I = 15$ A (Fig. 5).

After 1 h of *EC*, the initial colour (2170) was removed in 63%, turbidity (102) – in 100%, suspended solids (270) – in 71%, and phosphorus (10.7 mg/L) – in 51%. Since the fourth run of *EC* was twice shorter, the electro-coagulant dose required to achieve the above results was also twofold lower (50 mg Al/L). In such conditions purification results were not satisfactory, except for the final removal of P after 0.5 h of additional sludge settling. Therefore, *EC* has to last longer under practical conditions.

The results obtained during *EC* of municipal wastewater indicate that *EC* can pose a viable alternative to other wastewater treatment methods and can be seriously considered as an initial process of municipal wastewater purification.

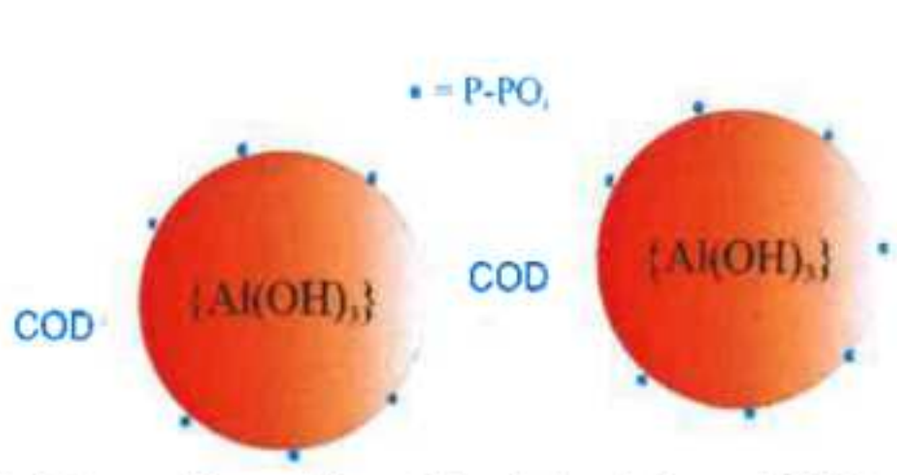

Fig. 6. Aggregation and flocculation of phosphates and COD in wastewater electrocoagulated with Al electrodes.

Gawar Construction Limited Dehradun
INDESIGN STUDIO AHMEDABAD

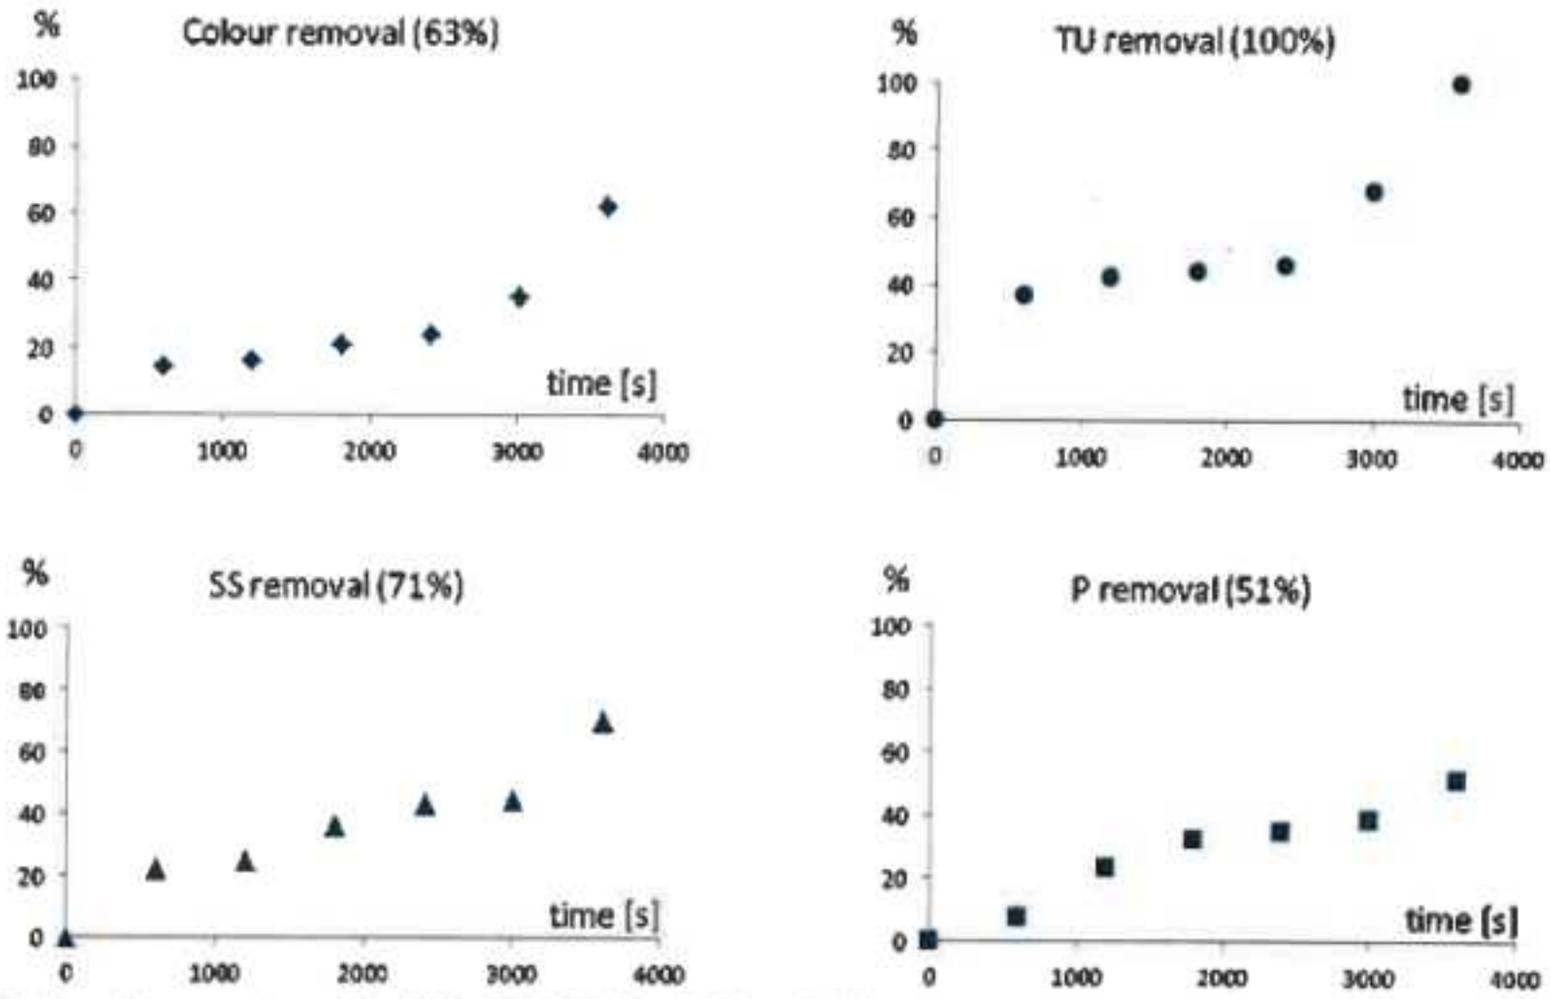

Fig. 7. Purification of sewage treated by *EC* at $I = 15$ A, $U = 3.0$ V, $t = 3600$ s, $pH_o = 6.97 + 19$ mL HCl, $P_o = 10.7$, $Colour_o = 2170$, $TU_o = 102$, $SS_o = 270$, $COD_o \rightarrow COD_f = 737 \rightarrow 304$ mg/L (–58.7%).

4. Conclusions

Municipal wastewater treated by the pilot electrocoagulation method (*EC*) is purified equally or more effectively than sewage treated in a laboratory. The costs of the main components of the *EC* system are determined by the prices of aluminium and energy. Therefore, a certain compromise has to be reached to match the specific requirements of a wastewater treatment plant. In the described pilot test: a) the maximum energy consumption associated with 55.5 mg Al/L was 0.53 kWh per tonne of sewage and b) the minimum energy consumption associated with 62.5 mg Al/L was 0.49 kWh per tonne of sewage. Sewage purification results seem promising, and they fulfil Polish effluent quality standards, excluding COD where higher efficiency is required, which is caused by the dissolved fractions. Electrocoagulation alone can pose a viable alternative to other wastewater treatment methods in most cases and will be an important initial step, where biological processes are required to remove dissolved COD during municipal wastewater purification.

Abstract — Treatment of sewage wastewater has become an absolute necessity because sewage is main point source pollutant on global scale. An innovative, cheap and effective method of purifying and cleaning wastewater before discharging into any other water system is needed. Wide ranges of wastewater treatment techniques are known which include biological process and physicochemical process. Study has been made to replace the biological treatment of sewage by electrochemical process with consideration to achieve desired water quality. Present study was conducted to investigate the applicability of the electro-coagulation technique for the treatment of sewage wastewater. In this study lab-scale electro-coagulation was carried out for the treatment of raw sewage wastewater at different operating time i.e 15min, 20min, 25min, 30min using Aluminum as Cathode and Mild steel as a Anode, with 15mm and 10 mm electrode spacing, supplying 24v and 10amp. It is observed that the batch which is operated at 10Amp for 30 min has maximum removal efficiency of COD & S.S i.e. 95% & 86% respectively at optimum pH 8.3.

Keywords: Sewage, Electro-Coagulation, COD removal

I. INTRODUCTION

Sewage is the main point source pollutant on a global scale [5]. So, direct discharge of raw or improperly treated sewage into the water body is one of the main sources of pollution [5]. Sewage normally consists of biological, chemical and physical constituents which usually high in Bio-chemical Oxygen demand (BOD), Chemical Oxygen Demand (COD) and Suspended Solids (SS). There are two main objectives of wastewater treatment, one is protecting the environment and other is conserving fresh water resources [1].

Nowadays, many treatment plants use the biological process in treating sewage water but there are also disadvantages for that process. Besides, this Conventional biological treatment needs aeration for days and growth of bacteria. To enhance the removal efficiency of Suspended Solids (SS) in conventional treatment, chemical coagulant such as alum, ferric chloride, ferric sulfate and lime are usually used resulting in suspended solid removal efficiency ranging between 80% to 90%. The major disadvantages of chemical precipitation process for the removal of SS and COD are that it involves the addition of chemicals which can be costly and result in the increase of Total Dissolve solids (TDS). Research in the past few decades, have shown that the Electro-Coagulation is a promising treatment method and have potential to treat variety type of wastewater including sewage.

Electro-coagulation treatment offers an alternative to the use of chemical coagulant such as metal salts or polymer for breaking the pollutants because during the Electro-coagulation process, the electrode can generate the metal hydroxides that destabilized and aggregate the suspended particles and precipitates. It is a complex process involving chemical and physical mechanism operating simultaneously to remove the organics from the sewage wastewater. It involves 3 successive stages

1) Formation of coagulants by Electrolytic oxidation of the sacrificial electrode such as mild steel.
2) Destabilization of contaminants, particulate suspension and breaking of emulsion.
3) Aggregation of destabilized phase to floc formation. (Mollah et al., 2014)

Main aim of the study is to investigate the potential of Electro-Coagulation process using Mild Steel electrodes in the removal of COD and SS from Domestic wastewater. The effect of electrolysis time, inter electrode distance for the removal of parameters are discussed.

II. MATERIALS AND METHODS

A. Sewage Water Samples

Raw sewage wastewater samples were collected from the Pirana 106 MLD sewage treatment plant located in Ahmedabad, Gujarat. The composition of sewage wastewater then characterized to identify the pH, SS, COD, TDS.

B. Experimental Set-up

The batch experimental set-up shown in Fig. 1. The Electrochemical unit consists of an Electrocoagulation cell, a DC power supply and the electrodes (4 Aluminum as cathode and 3 Mild Steel as anode). A Monopolar electrode having same dimensions (230mm X 170 mm X 3mm) as an anode and cathode which spacing of 10mm and 15 mm (depending on the experiment) between each other. The total effective area of electrode was 78200 mm2. All the electrodes were washed with dilute HCl before every experiment conducted.

C. Specifications of lab-scale model

Sr No	Physical Features	Dimensions
1	Reactor Dimensions	380 X 235 X 255 mm^3
2	Liquid Depth	210mm
3	Width of Baffle	50mm
4	Volume of Reactor	22L
5	No of Electrode	4 Al + 3 MS
6	Electrode Dimensions	230mm x 170mm
7	Electrode Area	78200mm^2
8	Thickness of Electrode	3mm
9	Distance between Electrode	15 mm & 10mm

Table 1: SPECIFICATION OF LAB-SCALE REACTOR

D. Electrodes for Lab-scale Model

In the present work Aluminum used as Cathode and Mild steel used as Anode. Electrode design is one of the most important factor that affects the Electro-coagulation process. Electrode design affects the release of coagulants in the solution and the bubble type.

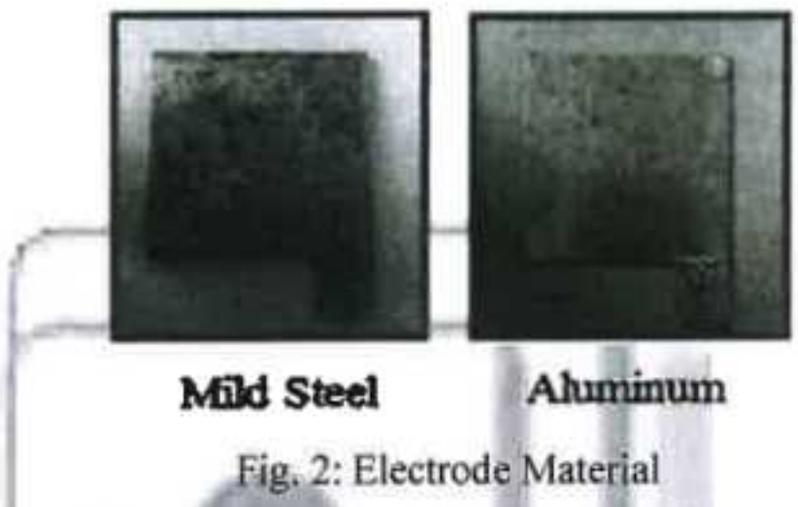

Fig. 2: Electrode Material

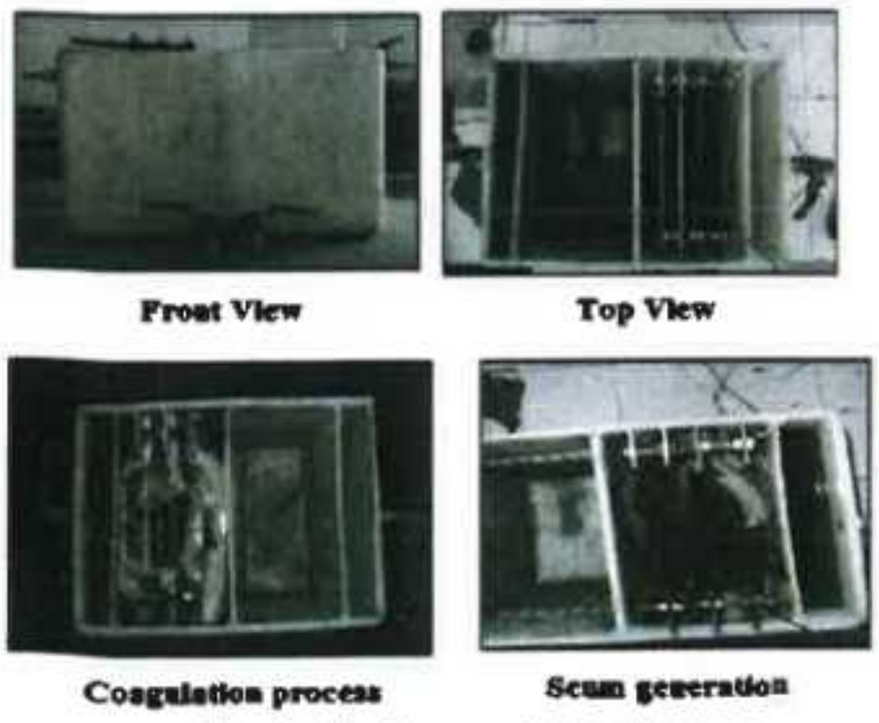
E. Experimental procedure

The experiments were carried out in a batch mode. Monopolar electrodes used with electrode distance 15mm and 10 mm. 10 Ampere and 24 volt are fixed in power supply unit. Each run was carried out at time interval of 15min, 20min, 25 min, and 30 min, once the DC power supply was started. Experiments were carried out to Determine the effect of electrode material, Electrocoagulation time, interelectrode distance and initial pH. After the experiment 500ml treated sample was taken from each plate and then kept undistributed for 60 min in order to allow the flocs to settle. Subsequently after settling the sample of supernatant was collected to perform the analysis of TDS, SS and COD.



. Fig. 3: Electrocoagulation Process

III. RESULTS AND CONCLUSION

A. Characteristics of raw sewage water

Parameter	Avg Value
COD(mg/L)	506
SS(mg/L)	182
TDS(mg/L)	847
pH	7.1

Table 2: Average raw sewage characteristics of 106 MLD, Pirana, Ahmedabad

Parameter	Avg Value
COD(mg/L)	506
SS(mg/L)	182
TDS(mg/L)	847
pH	7.1

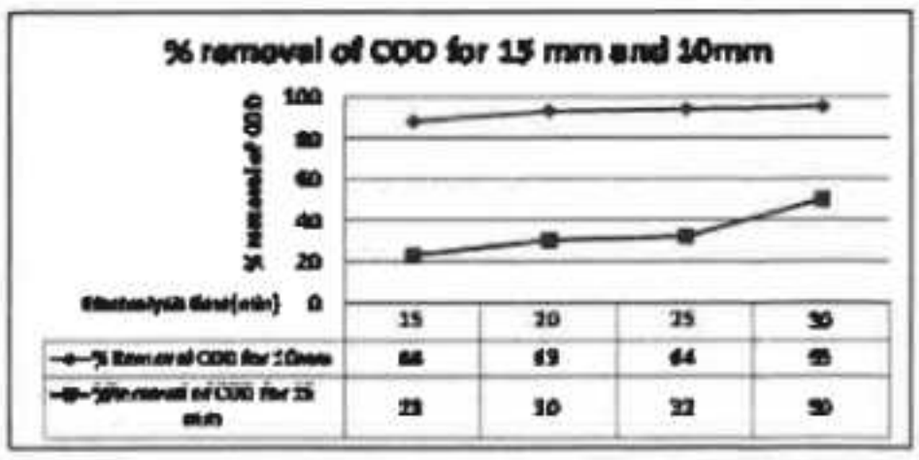
B. Effect of electrolysis time

As shown in fig 4 as the time of electrolysis increase comparable changes in the removal efficiency of COD, SS, TDS and pH are observed. Reactive time also influence the treatment efficiency of Electrocoagulation Process because the more time consume the more production rate of hydroxyle and metal ions are produced on the electrodes.

Parameter	Raw	15 min	20min	25min	30min
COD(Mg/L)	457.6	52	31.2	26	20.8
% removal	-	88	93	94	95
SS(Mg/L)	440	120	120	60	60
% removal	-	72	72	86	86
TDS(Mg/L)	790	755	748	742	734
% removal	-	44	53	60	70
pH	7.6	8.0	8.1	8.1	8.3
Energy consumption(kwh/m^3)		6.31	8.42	10.52	12.6

Table 3: Effect of Electrocoagulation time on parameters

C. Effect of interelectrode distance



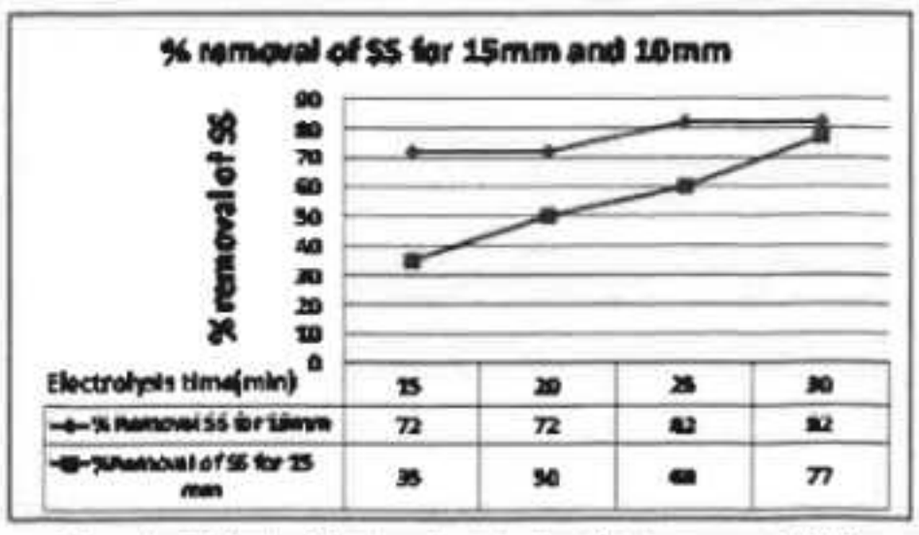


Fig. 4: Effect of inter electrode distance on COD

Gawar Construction Limited Dehradun
INDESIGN STUDIO AHMEDABAD

and SS removal using MS and Al electrode, current density 42A/m2 and for 15 min, 20min, 25min, 30min Ec time.

The effect of interelectrode distance shows a significant result in this experiment.

Electrolysis time(min)	COD(% removal)		SS(%removal)	
	15mm	10mm	15mm	10mm
15	23	88	35	72
20	30	93	50	72
25	32	94	60	86
30	50	95	77	86

Table 4: Effect of electrolysis time on COD and SS removal

As shown in fig 4, when interelectrode distance increases the efficiency of COD and SS removal decreases slightly because the rate of electron transfer is become slower. Variations of the percentage removal with inter electrode distance is shown in figure below.

IV. CONCLUSION

In this study the EC process was found to be an effective method for the treatment of Domestic wastewater. The effect of operational conditions such as electrolysis time, pH and inter electrode distance on removal of COD and SS was examined. The result showed that the removal of COD and SS increase with increase electrolysis time except for pH and inter electrode distance. The highest removal efficiency of COD by 95%, SS by 82% occurred at 42A/m2 current density, 10mm electrode distance and pH 8.3 in 30min of operating time by Mild Steel electrode.

ACKNOWLEDGEMENT

It is indeed a great pleasure for me to express my deep and profound gratitude to Dr. N. S. Varandani, Head of Environmental Engineering Department,
LDCE for providing me an opportunity to work on the Dissertation titled "Comparative Study of Electro-Coagulation and Electro-Oxidation for Oxidation of Organics from Sewage". Their faith in my abilities has led me to a path of confidence and determination. I express my deep gratitude to Prof. Minarva pandya, Prof.Huma Syed and Prof. Dimpi shah and Mrs Varsha for their stimulating support in various ways. I am also thankful to Sandip Parmar Student of L.D college of Engg who helped me in all way possible to conduct the study and all staff members of AMC 106MLD and 126MLD who helped me a lot for collecting fresh sewage whenever I needed. I equally Thanks to my Family members, to all my friends specially Prashant Thakkar, Monika panchani and other classmates i.e Nilesh, Harshit , Huzaifa, Dharmesh, Ketan, mitul for helping me to complete my work. Last but not the least; I am deeply thankful to all the known and unknown persons who have helped me a little or more towards completion of my task.To those I am sure to miss out, my sincerest apologies.

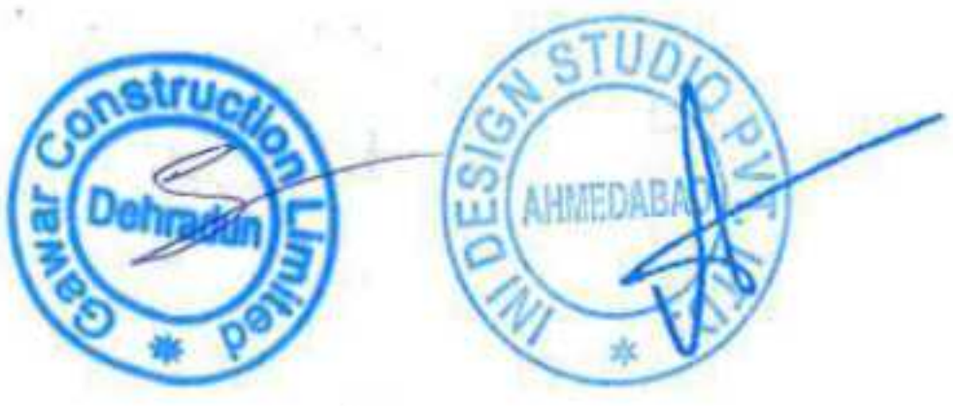
Abstract

Sewage has become a major point-source pollutant on a global scale. The management and treatment of wastewater is important to ensure that it is processed to a safe quality before re-use or disposal. The purpose of this study is to investigate the effectiveness of the electrocoagulation process in treating wastewater as an alternative to conventional methods to treat sewage. A 2 litre batch electrocoagulation unit was set up consisting of 4 monopolar electrodes connected to a DC power supply and the process was investigated for chemical oxygen demand, ammonia, and phosphates reduction. Iron and aluminium were comparatively used as the treatment electrodes, and effects of operating conditions like applied voltage and treatment time were investigated. Voltage was varied from 5V, 10V and 15V for 30 and 60 minutes treatment duration and aluminium gave better results than iron. The optimum conditions were experimentally determined to be 15V at 30 minutes treatment using aluminium, to give 92% COD removal, 100% phosphate removal and 61% ammonia removal using DC current converted to alternating pulse current by use of a circuit. The experimental results showed electrocoagulation to be a feasible process in the treatment of wastewater.

Keywords: electrocoagulation; wastewater treatment; applied voltage; COD removal; phosphate removal; ammonia removal; monopolar electrodes.



INTRODUCTION

Sewage is the main point-source pollutant on a global scale [1]. The biological and chemical composition of sewage is usually high in Biological Oxygen Demand (BOD), Suspended Solid (SS) and Chemical Oxygen Demand (COD). So, direct discharge of raw or improper treated sewage into the water body is one of the main sources of pollution on a global scale [1]. Wastewater treatment serves two main objectives, protecting the environment and conserving fresh water resources [2].

Treated municipal wastewater is considered, in many major cities of the world, as a supplementary water source for several uses such as agricultural irrigation, landscaping, industrial activities (cooling and process needs), groundwater recharge, recreational and other uses. The continued dependence on treated municipal wastewater for the previously mentioned uses coupled with emerging stricter policies/guidelines for such uses prompted scientists and researchers to concentrate in improving current treatment technologies and to come up with innovative ideas to treat municipal wastewater in an efficient and cost effective manner [3].

The most common conventional methods of treating sewage include Activated Sludge Process, Aerated Lagoons (Oxidation Ponds), Biological Trickle Filtration systems and Anaerobic Digesters. The major disadvantages of most of the conventional methods is that they consume a lot of space and require long periods to process sewage. Simple and efficient sewage water treatment systems are urgently needed in developing countries [4].

Electrocoagulation is one of a simple method to treat wastewater efficiently [5]. Electrocoagulation (EC) is an emerging technology that combines the functions and advantages of conventional coagulation, flotation, and electrochemistry in water and wastewater treatment [6]. It is a complex process involving chemical and physical mechanisms operating simultaneously to remove pollutants from wastewaters [2]. Therefore the potential of electrocoagulation to treat multiple contaminants must be studied. Wastewater is the main cause for irreversible damages to the environment and also contributes to the reduction of fresh water reserves, creating threats to the next generation [7]. Sewage treatment plants are then setup to manage wastewater disposal from the sewer systems and processing this wastewater to safe quality before re-use or disposal.

The purpose of this study is to investigate the treatment of wastewater using electrocoagulation and study its effectiveness as an alternative treatment system to already existing methods. Eyvaz et al. (2014) states that electrocoagulation (EC) has gained many interest due to providing simple, reliable and cost effective operation for the treatment of wastewaters without and need for additional chemicals, and thus the secondary pollution [8].

Research, in the past few decades, have shown that electrocoagulation is a promising

Gawar Construction Limited Dehradun

INI DESIGN STUDIO PVT. LTD. AHMEDABAD

treatment method and effectively potential to treat variety type of wastewaters including dyes wastewater, tannery wastewater, restaurant wastewater, palm oil mill effluent, food wastewater, potato chip manufacturing wastewater, urban wastewater, and removing heavy metals [9-10]. Hence a multiple contaminant treatment system could prove very beneficial for municipalities and this could lead to advancement in water treatment technology.

METHODS AND MATERIALS

A schematic diagram of the experimental set-up is depicted in Figure 1. The electrochemical circuit unit consists of an electrocoagulation cell, a D.C power supply and the electrodes (aluminum and iron) and is shown in Figure 2. A magnetic stirrer was put in place to keep the composition the sample homogeneous throughout the treatment and set at 100 rpm. All the electrodes were washed with 5% HCl before every experiments conducted. At the beginning of each experiment, 2000 mL of Municipal wastewater was fed into the electrocoagulation cell and current was applied to the circuit for 60 min. The amount of voltage that were applied to the system were 5, 10 and 15 V with maximum treatment time of 60 minutes. Every experiment was performed at room temperature and experimental samples were taken at 5 minute intervals of each run for COD, phosphate and ammonia measurements. Reagent grade of chemicals were used without further purification in every experiment. The pH value was determined by a pH meter (HACH HQ11d). The COD values were measured using a Double Beam UV/VIS Spectrophotometer (PERKIN – ELMER). Conductivity measurements were obtained using a Conductivity meter (Eutech CON 5100). Phosphates and ammonia measurements were obtained using a Single Beam Ultra-Violet Visible Spectrophotometer (HACH-LANGE DR 6000). The system's current was provided by a regulated D.C power with maximum 30V and 3A output volume and current respectively with a 2cm gap between them.

Figure 1: Electrocoagulation unit setup

Gawar Construction Limited Dehradun

INI DESIGN STUDIO AHMEDABAD

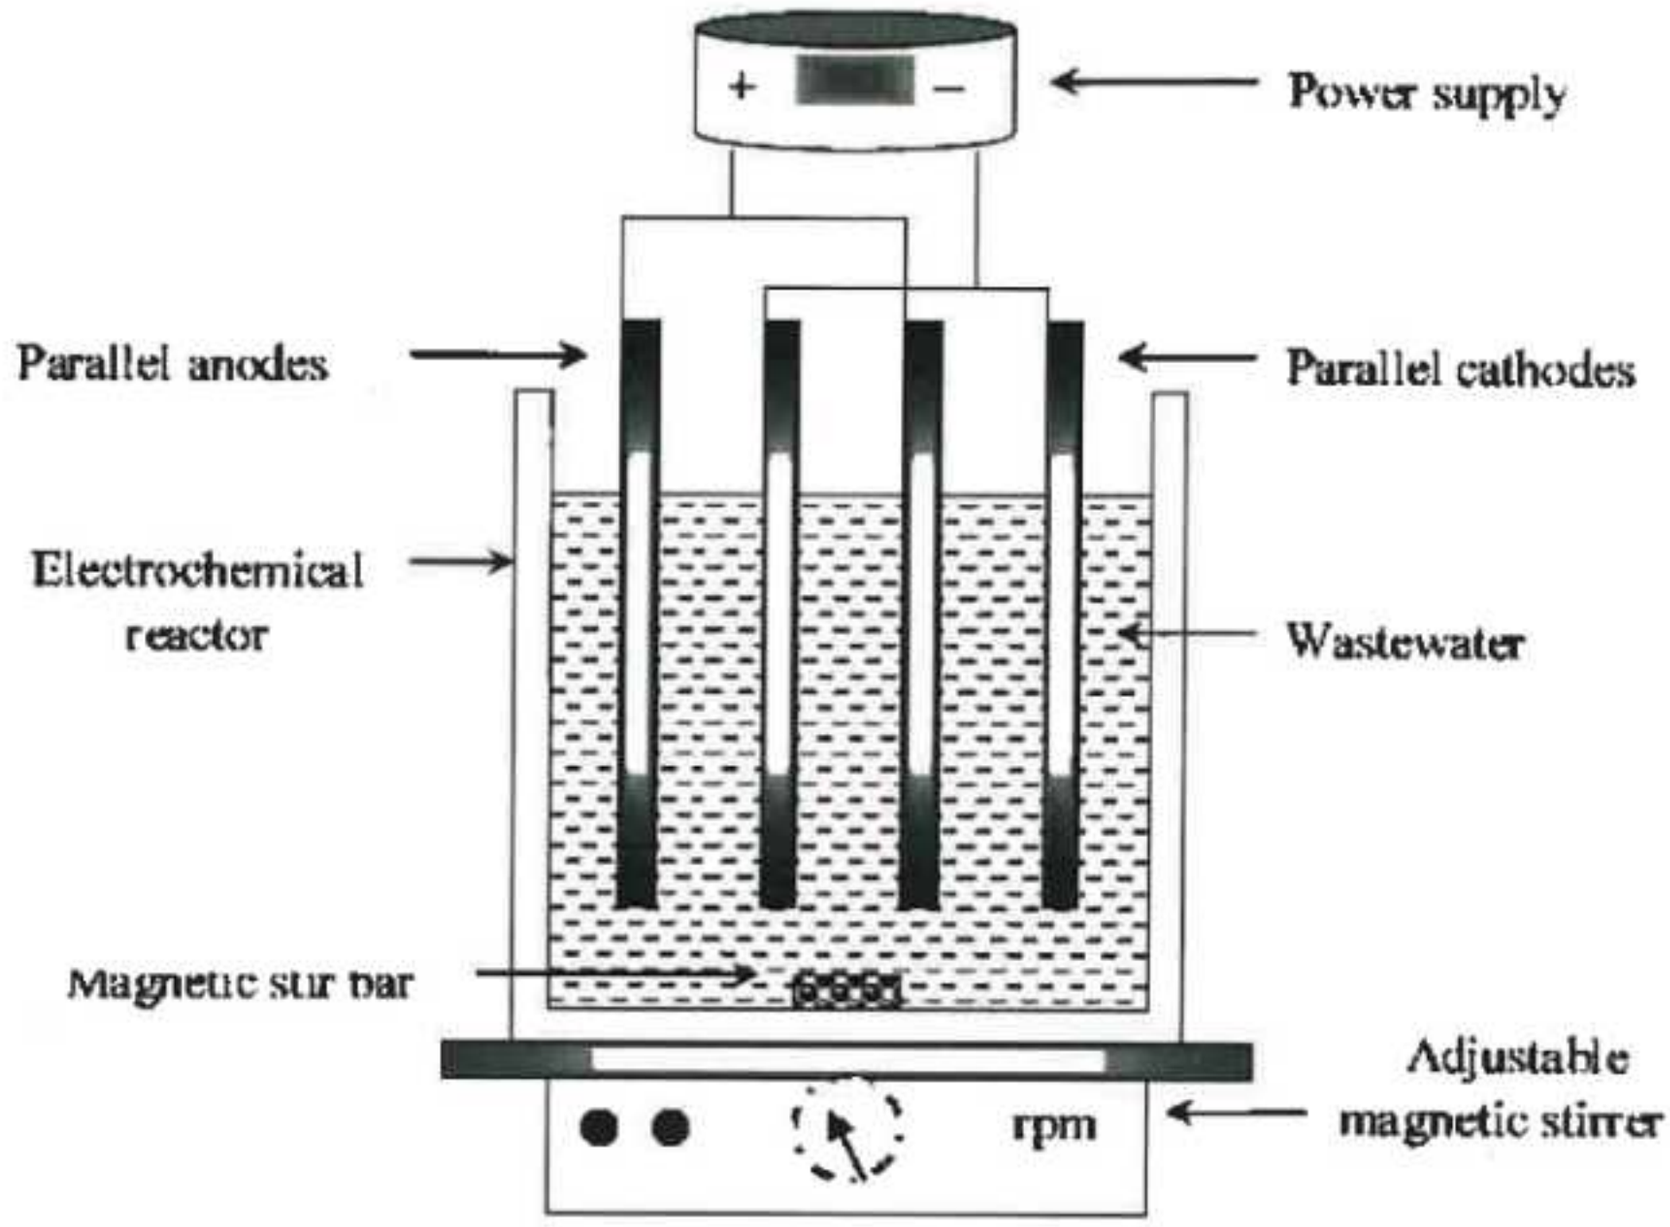


Figure 2: Circuit diagram of electrocoagulation reactor setup

Effect of electrode material

Aluminium and iron were compared for their treatment efficiency. The varied parameters were voltage and treatment time for each electrode.

Effect of Applied Voltage

Voltage was varied from 5V, 10V to 15V. Each voltage was run on a fresh sewage sample. The electrodes were washed with 5% HCl and rinsed with water before and after each treatment in order to remove all dirt from the electrodes [11-12].

Effect of treatment time

50 ml samples were taken after 30 minutes and 60 minutes treatment time. These were filtered and preserved with concentrated H_2SO_4 at 4°C for analysis. The amount of electrode material used up in the treatment was determined using Faraday's Law

$$W = \frac{itM}{zF}$$

Gawar Construction Limited Dehradun
INI DESIGN STUDIO AHMEDABAD

RESULTS AND DISCUSSION

pH and conductivity

The effect of pH and conductivity were not subjects of this study, but were analyzed before treatment was carried out to ensure that their values could suffice electrocoagulation. From literature near neutral pH and conductivity in the range >50mS/cm was adequate for electrocoagulation. Domestic wastewater has a fairly good concentration of dissolved salts like NaCl which enable the conduction of current.

Treatment using iron

The EC process was first applied using iron electrodes and the results shown in Table 1.

Table 1: Characteristics of raw and treated wastewater for iron at 5, 10 and 15 volts

5 VOLTS	Pre-Treatment	30-Minutes	60-Minutes
COD (mg/L)	346	242.2	215
Phosphates (mg/L)	10.8	1.3	0.11
Ammonia (mg/L)	56.4	50.1	49.3
10 VOLTS	**Pre-Treatment**	**30-Minutes**	**60-Minutes**
COD (mg/L)	470	222	153
Phosphates (mg/L)	7.51	0.12	0.00
Ammonia (mg/L)	58.6	37.4	30.8
15 VOLTS	**Pre-Treatment**	**30-Minutes**	**60-Minutes**
COD (mg/L)	481	154	96.1
Phosphates (mg/L)	10.33	0.00	0.00
Ammonia (mg/L)	41.7	23.2	19.13

Removal Efficiency was calculated from equation 1:

Taking COD at 5 Volts, Removal efficiency (R %) was calculated from equation 1:

$$R\%\,(30\text{minutes}) = \frac{346-242.2}{346}\times 100 \qquad (1)$$

$$= 30\%$$

(Tables showing Removal efficiencies are in the Appendix)

Effect of Time :

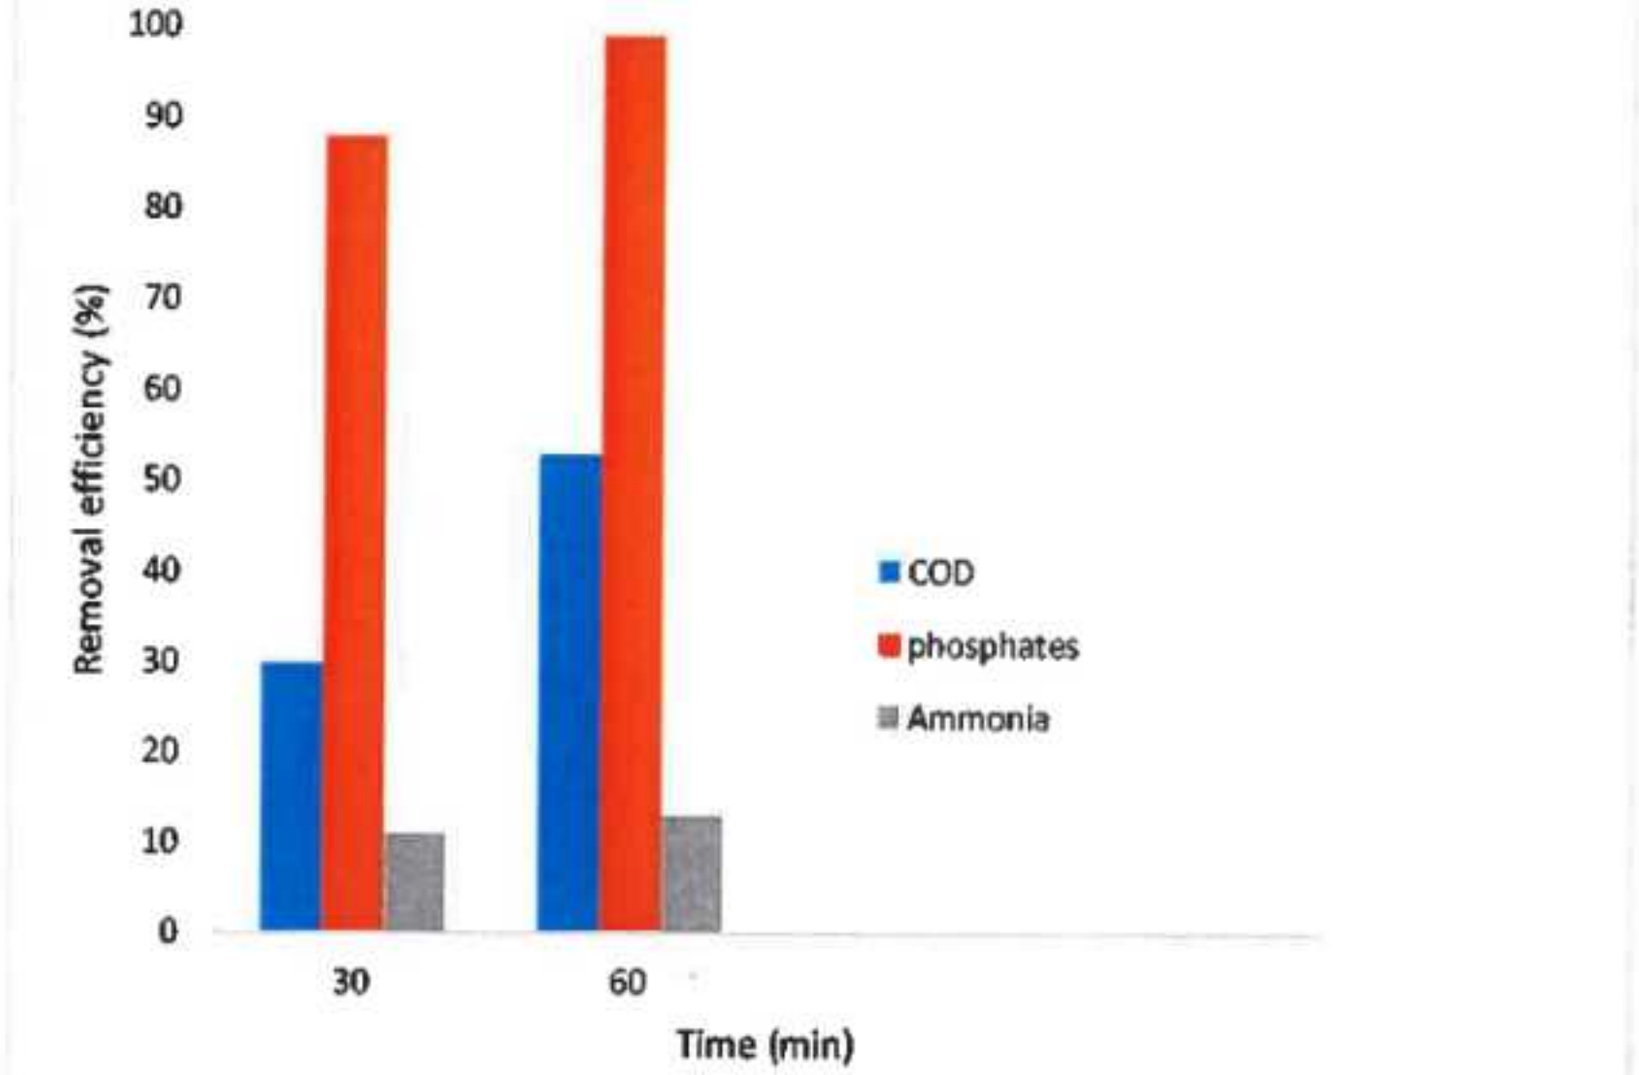

Figure 3: Effect of time at on removal efficiency at 5 volts

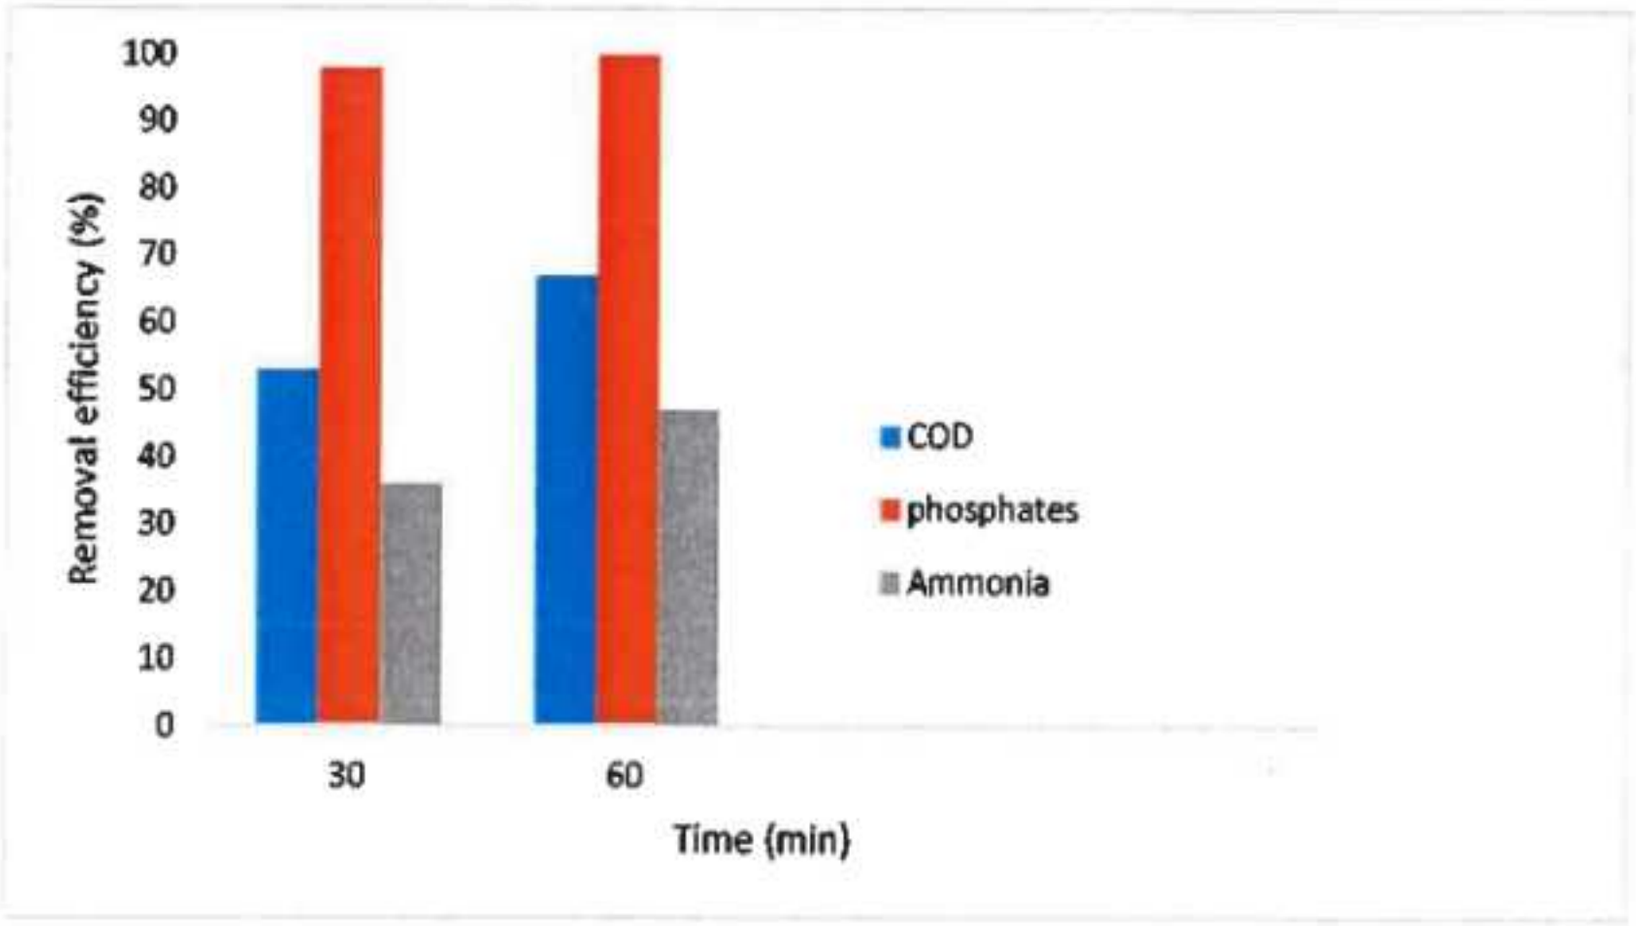

Figure 4: Effect of time on removal efficiency at 10 volts

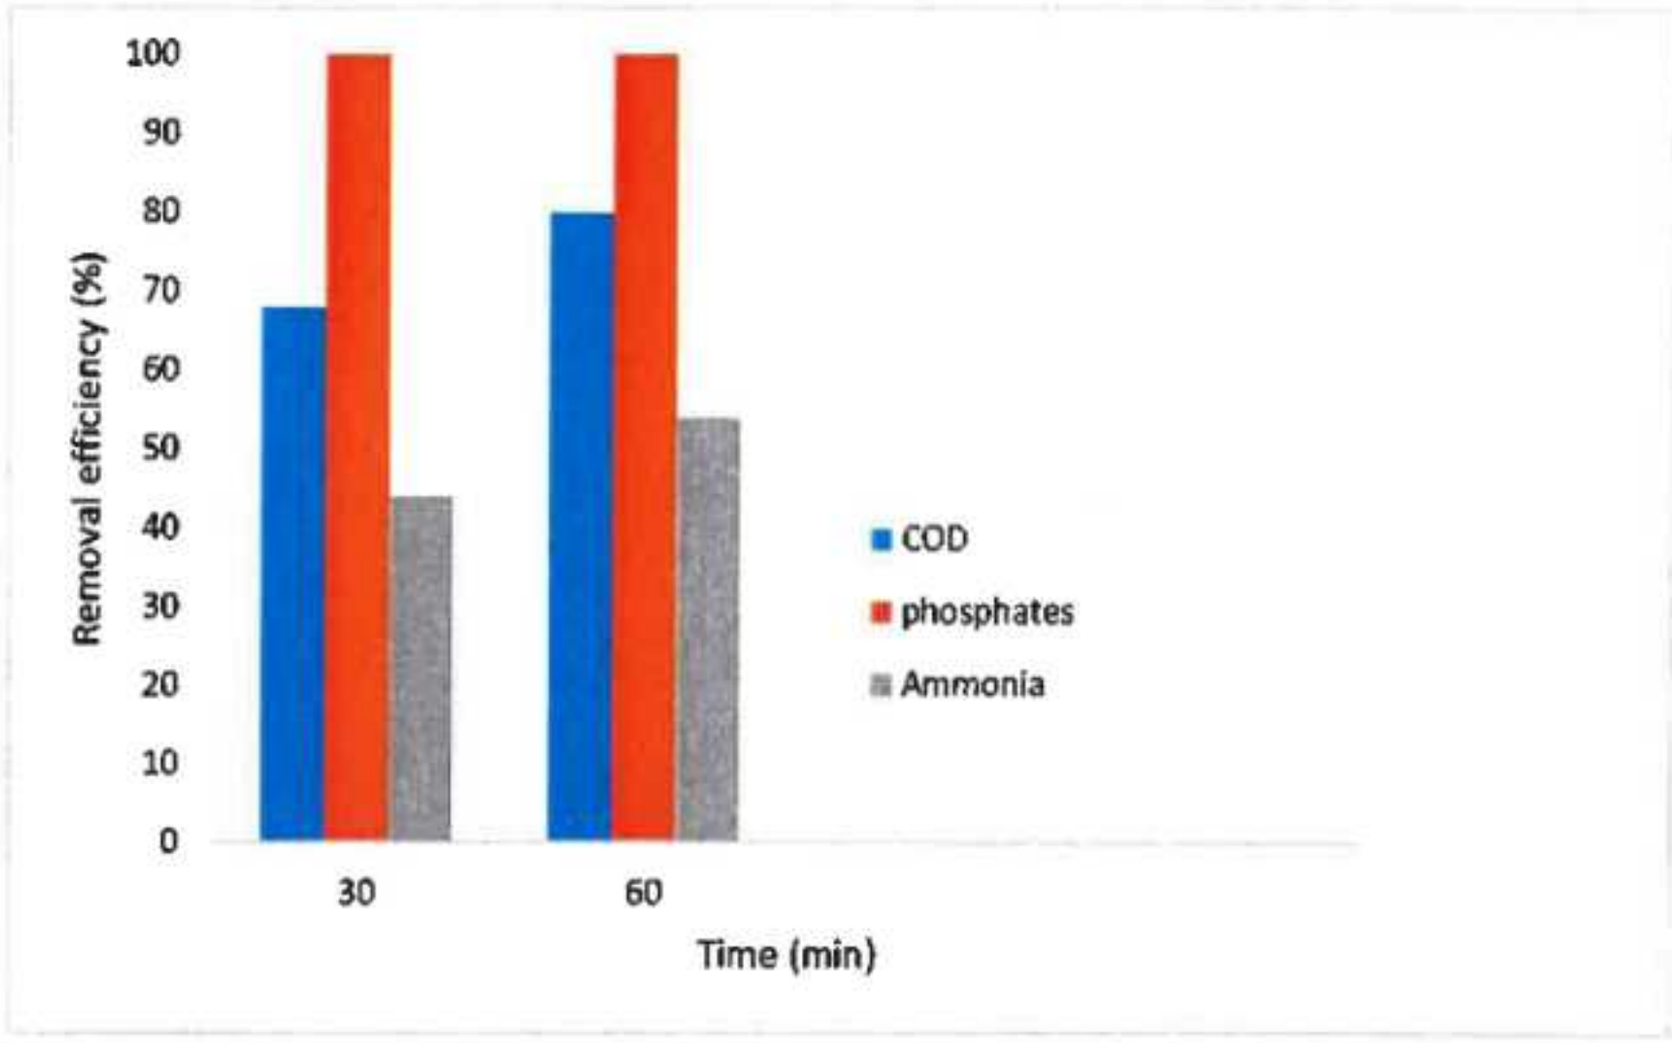

Figure 5: Effect of time on removal efficiency at 15 volts

Effect of Applied Voltage :

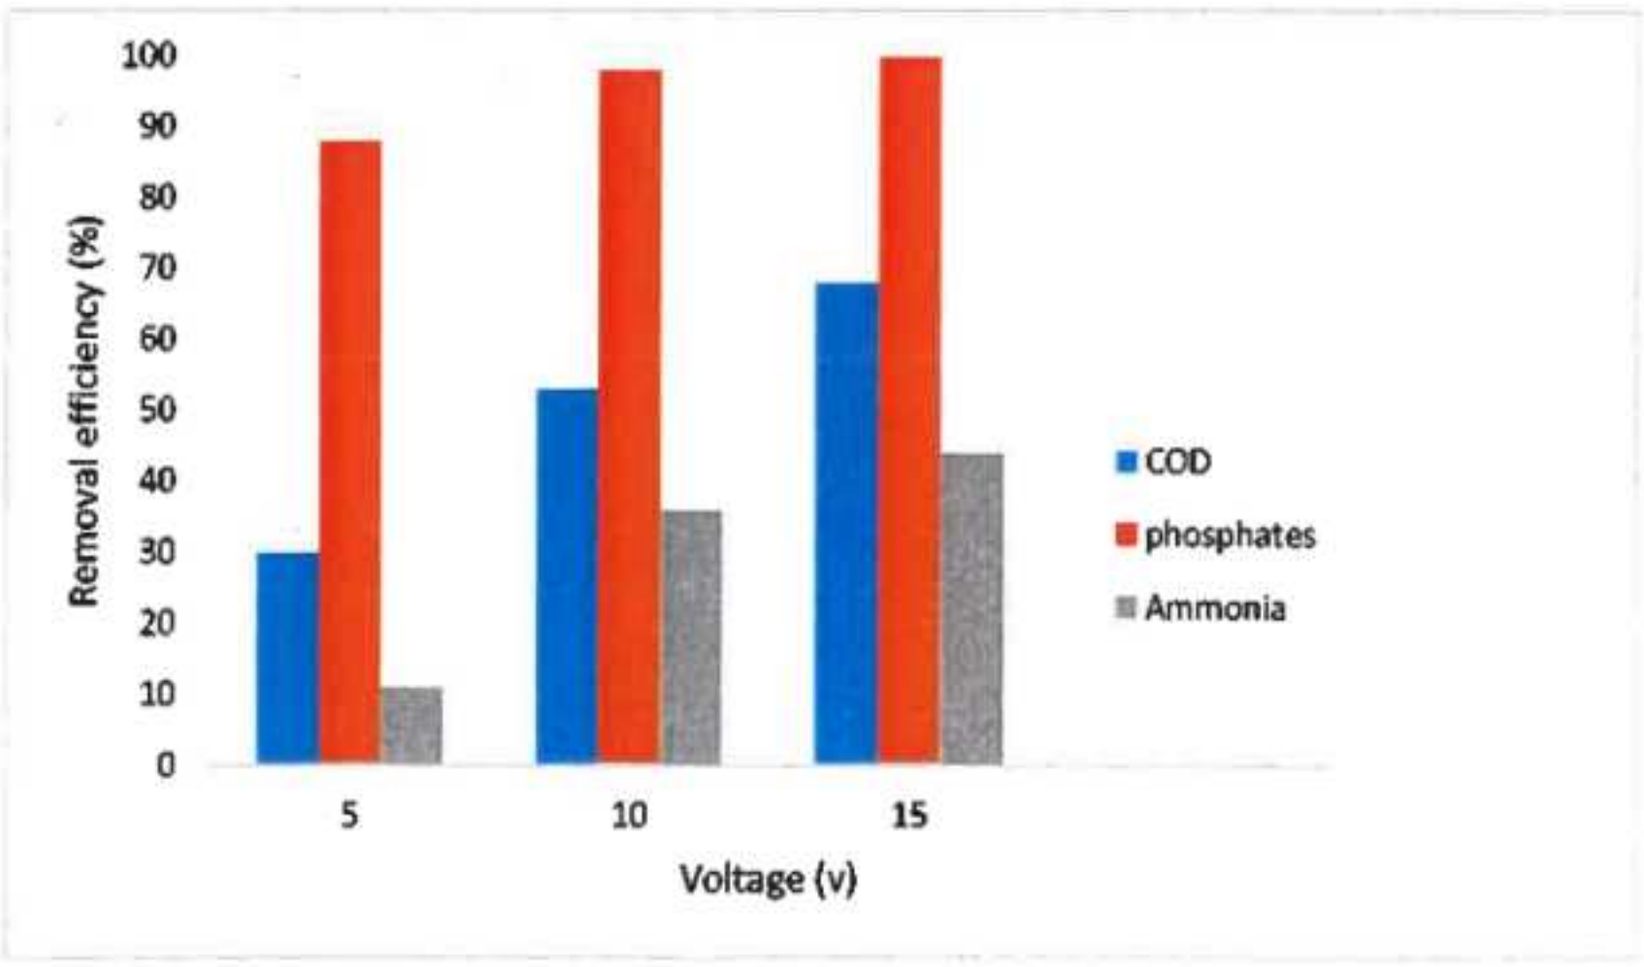

Figure 6: Effect of applied voltage on removal efficiency after 30 minutes treatment

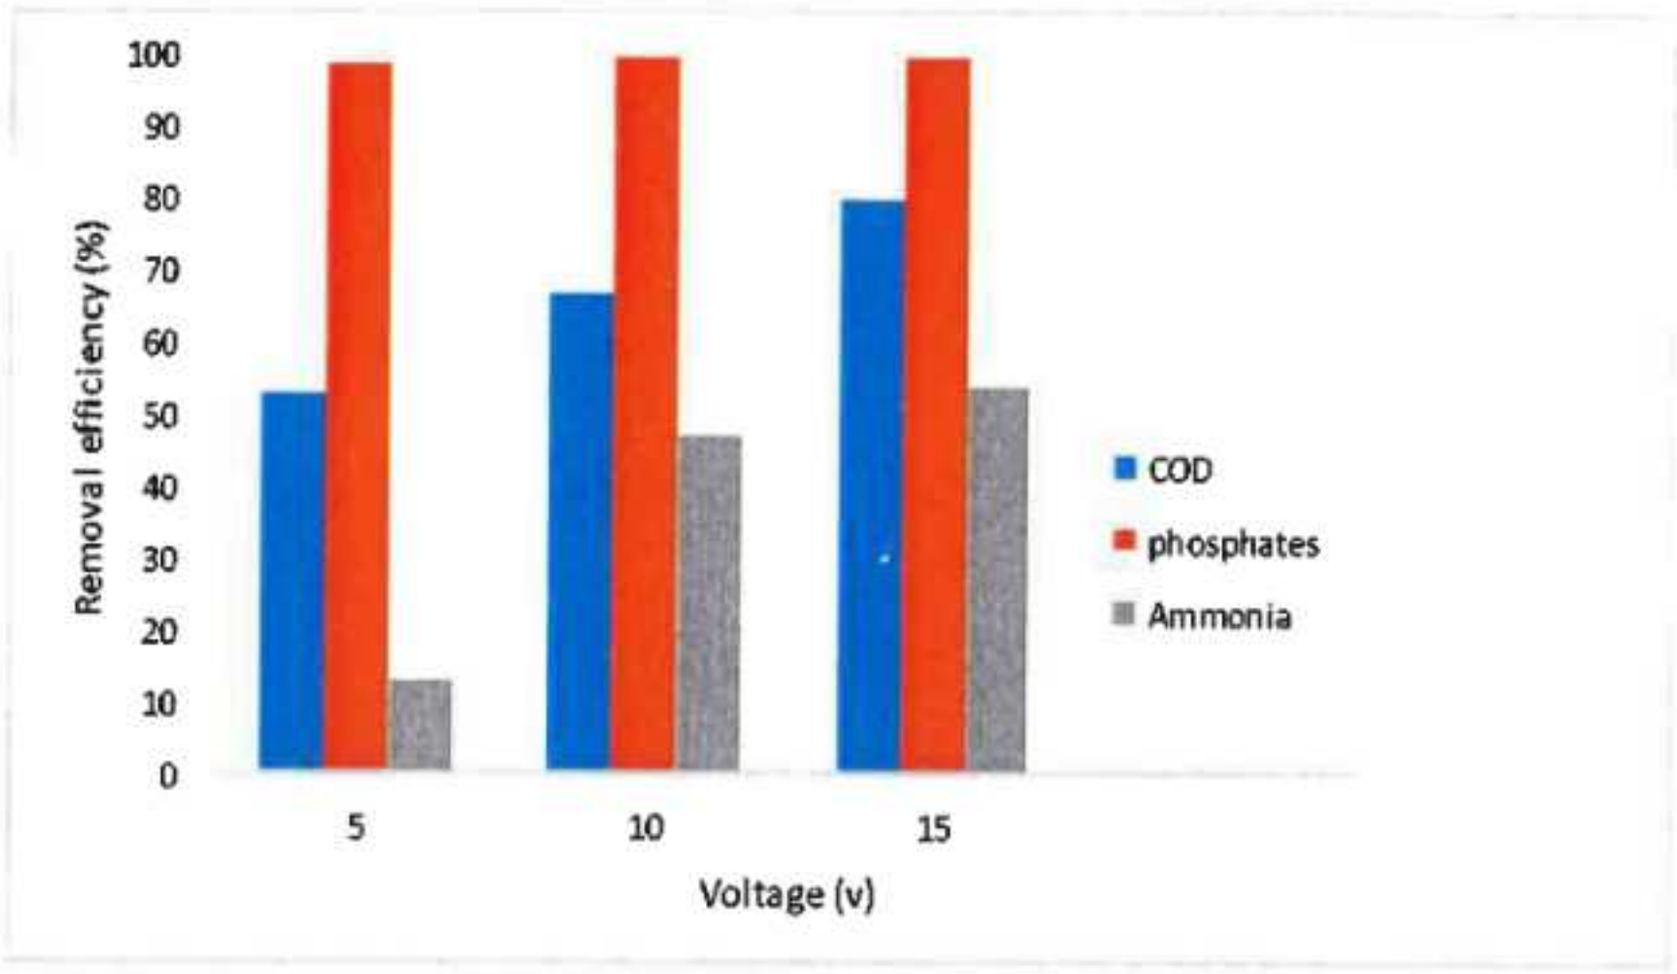

Figure 7: Effect of applied voltage on removal efficiency after 60 minutes treatment

Table 1 shows the results obtained for iron at different voltages and different treatment times. The best result was obtained at 15 volts after 60 minutes treatment. COD, phosphates and ammonia were reduced from 481 mg/L, 10.33 mg/L, and 41.7 mg/L to 96 mg/L, 0.00 mg/L and 19.13 mg/L. Conversely, the lowest result was obtained at 5 volts. Figures 3 to 5 show that increasing treatment time increases removal and Figures 6 and 7 show that increasing voltage had a positive effect on removal efficiency of all pollutants because of the increase in anode dissolution per unit time. 80%, 100% and 54% removal efficiencies were obtained for COD, phosphates and ammonia respectively.

Using iron electrodes, the treating solution began to change into a greenish color after 5 minutes and then switched into brownish color a few minutes later during treatment. These particles are extremely fine and very hard to precipitate, the color was also hard to wash from the vessels. Therefore all subsequent treatments were carried out using aluminum.

TREATMENT USING ALUMINUM

Because of the problems associated with using iron, the results are associated with aluminium

The tables show that initial concentration is also an important factor to be considered in electrocoagulation. From Table 2, comparing COD removal, it can be seen that a higher initial COD loading meant a relatively higher COD loading in the final treated

Gawar Construction Limited Dehradun

IN DESIGN STUDIO PVT. LTD. AHMEDABAD

solution. The same is true with ammonia, which exhibits the same trend as COD. Phosphate conversely did not seem to be affected by this factor. COD was in the blue zone, ammonia red and phosphate blue according after 60 minutes treatment at 15 volts. 30 minutes treatment produced similar results.

Effect of Time:

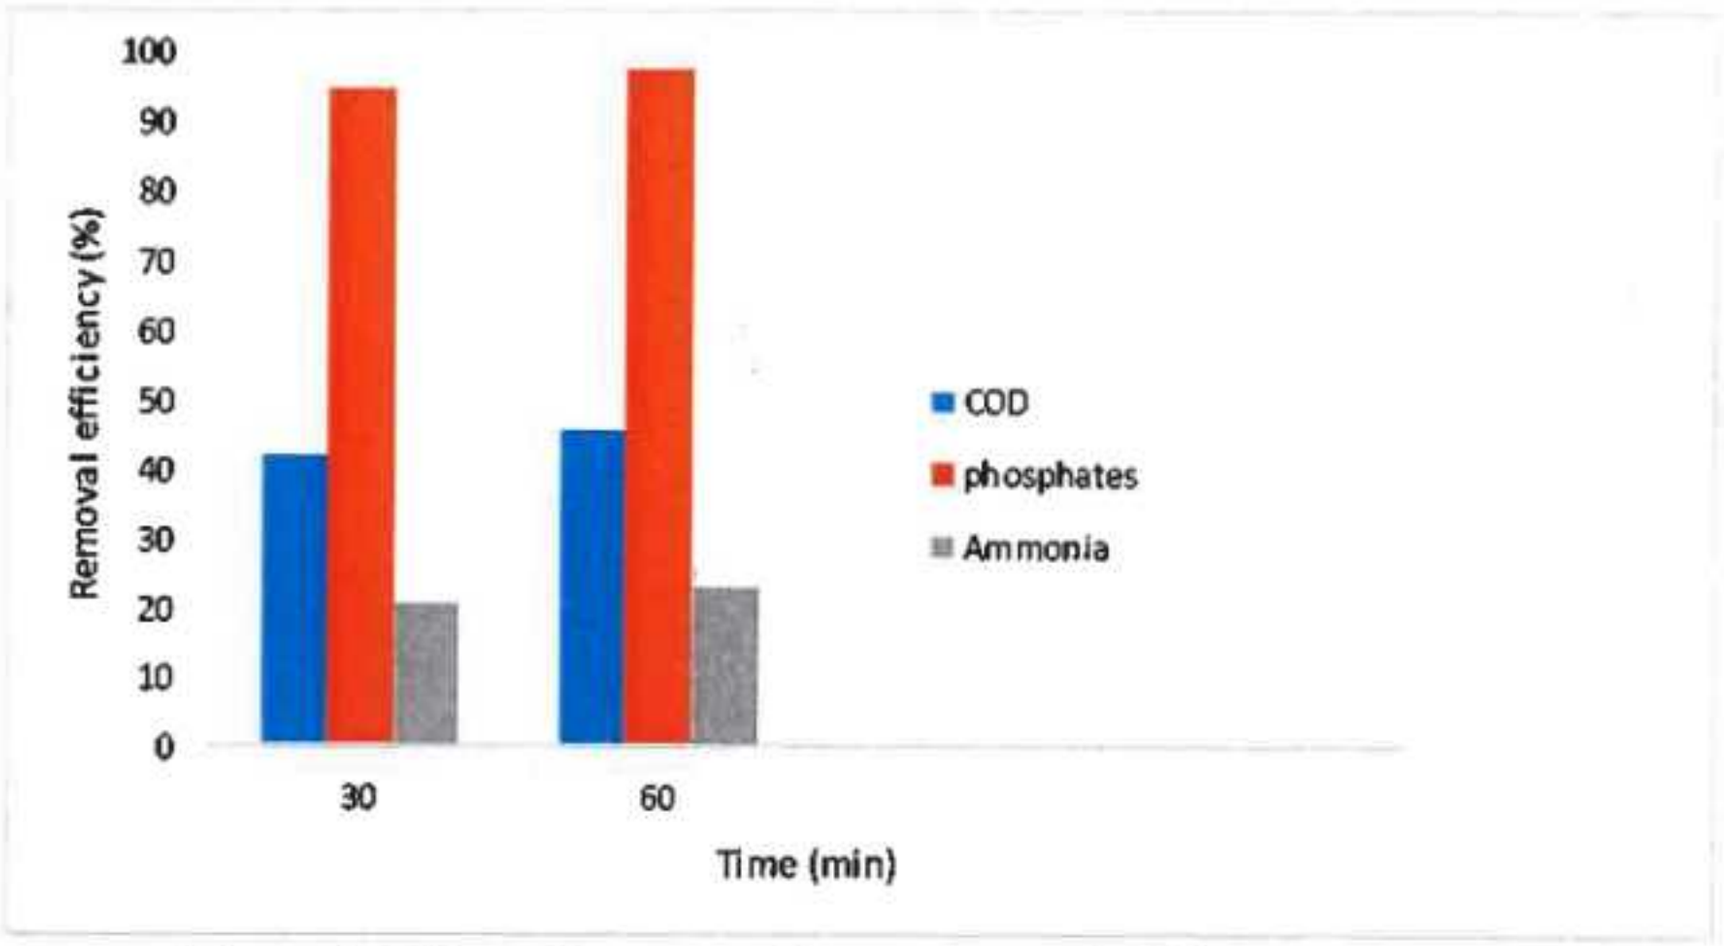

Figure 8: Effect of treatment time on removal efficiency at 5 volts

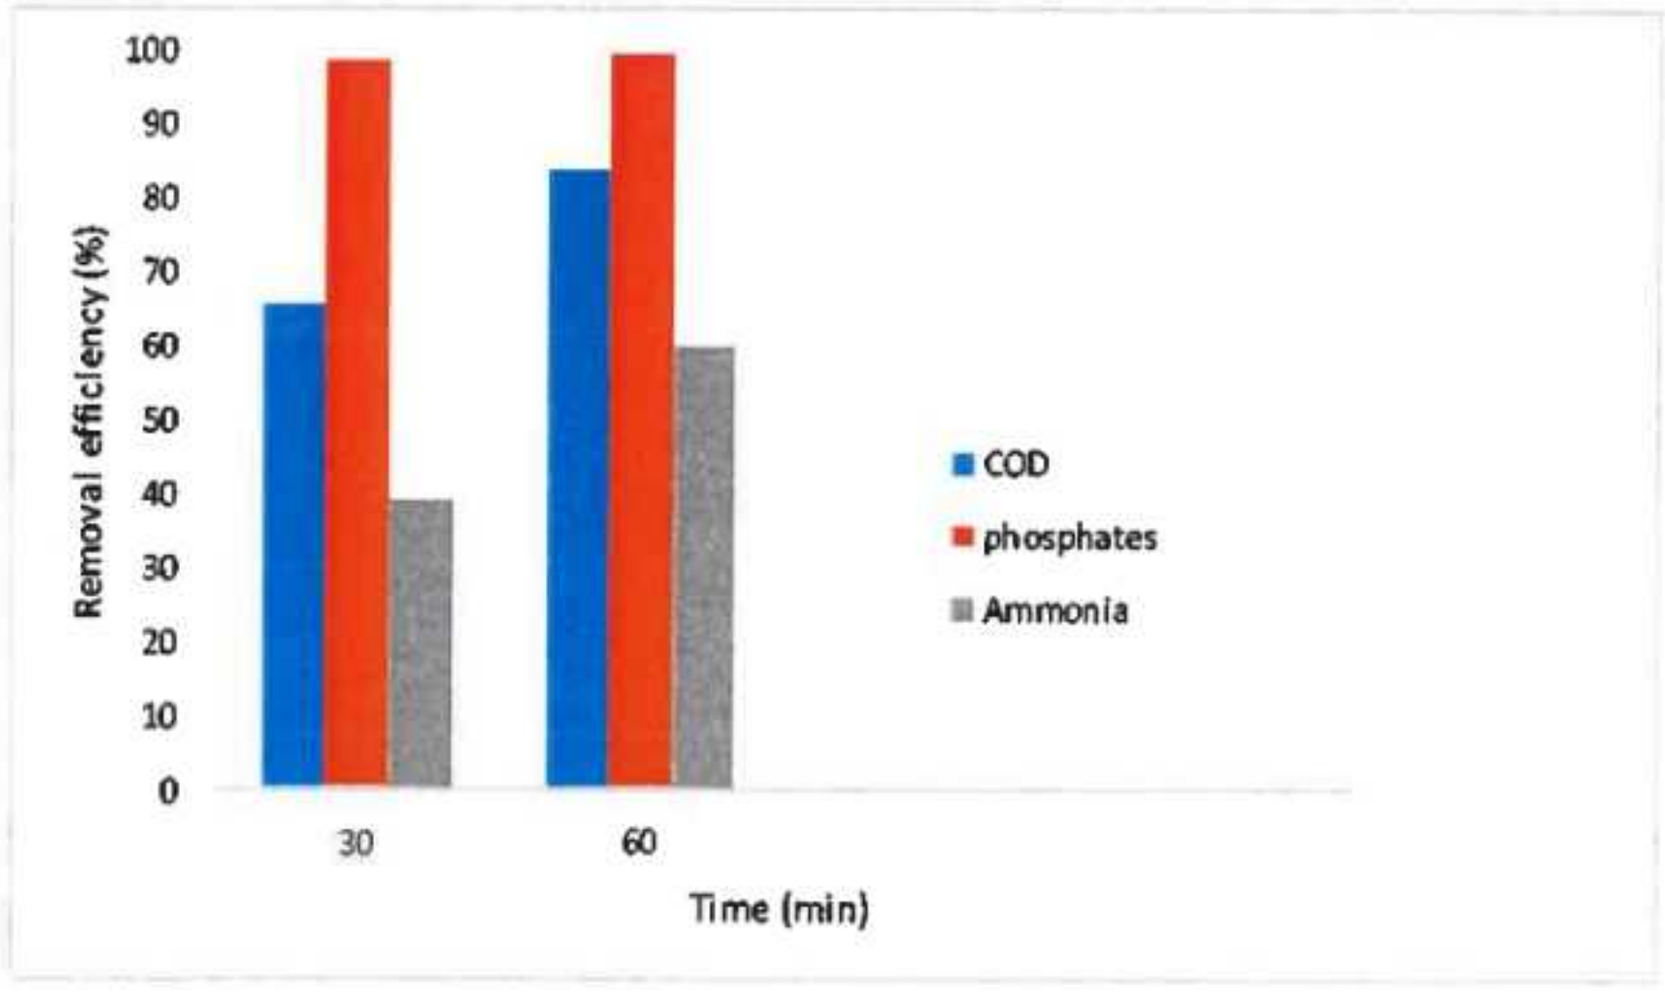

Figure 9: Effect of treatment time on removal efficiency at 10 volts

Gawar Construction Limited Dehradun
INI DESIGN STUDIO PVT. LTD. AHMEDABAD

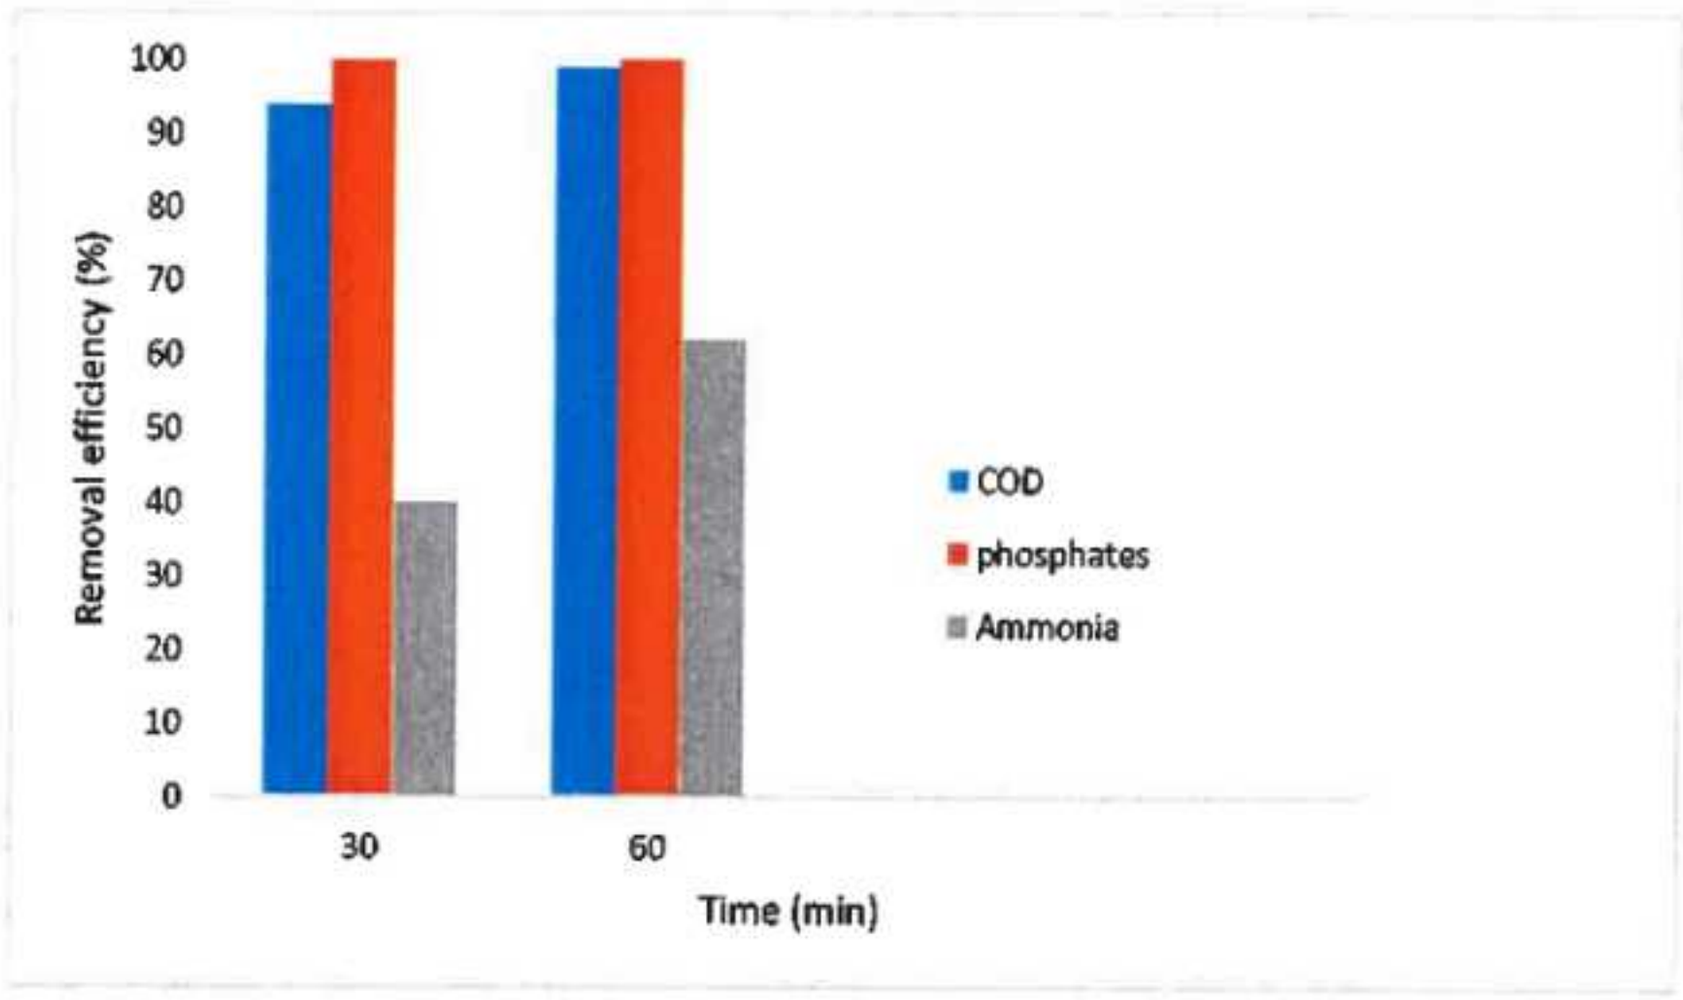

Figure 10: Effect of treatment time on removal efficiency at 15 volts

Figures 8-10 show pollutant reduction to be a function of time. An increase in treatment time results in a subsequent increase in removal efficiency. The best COD reduction was observed after 60 minutes. The same is true with ammonia. 100% phosphate removal efficiency just after 30 minutes at 15 volts, and at all voltages, excellent phosphate removal was observed after 30 minutes.

Effect of Applied Voltage

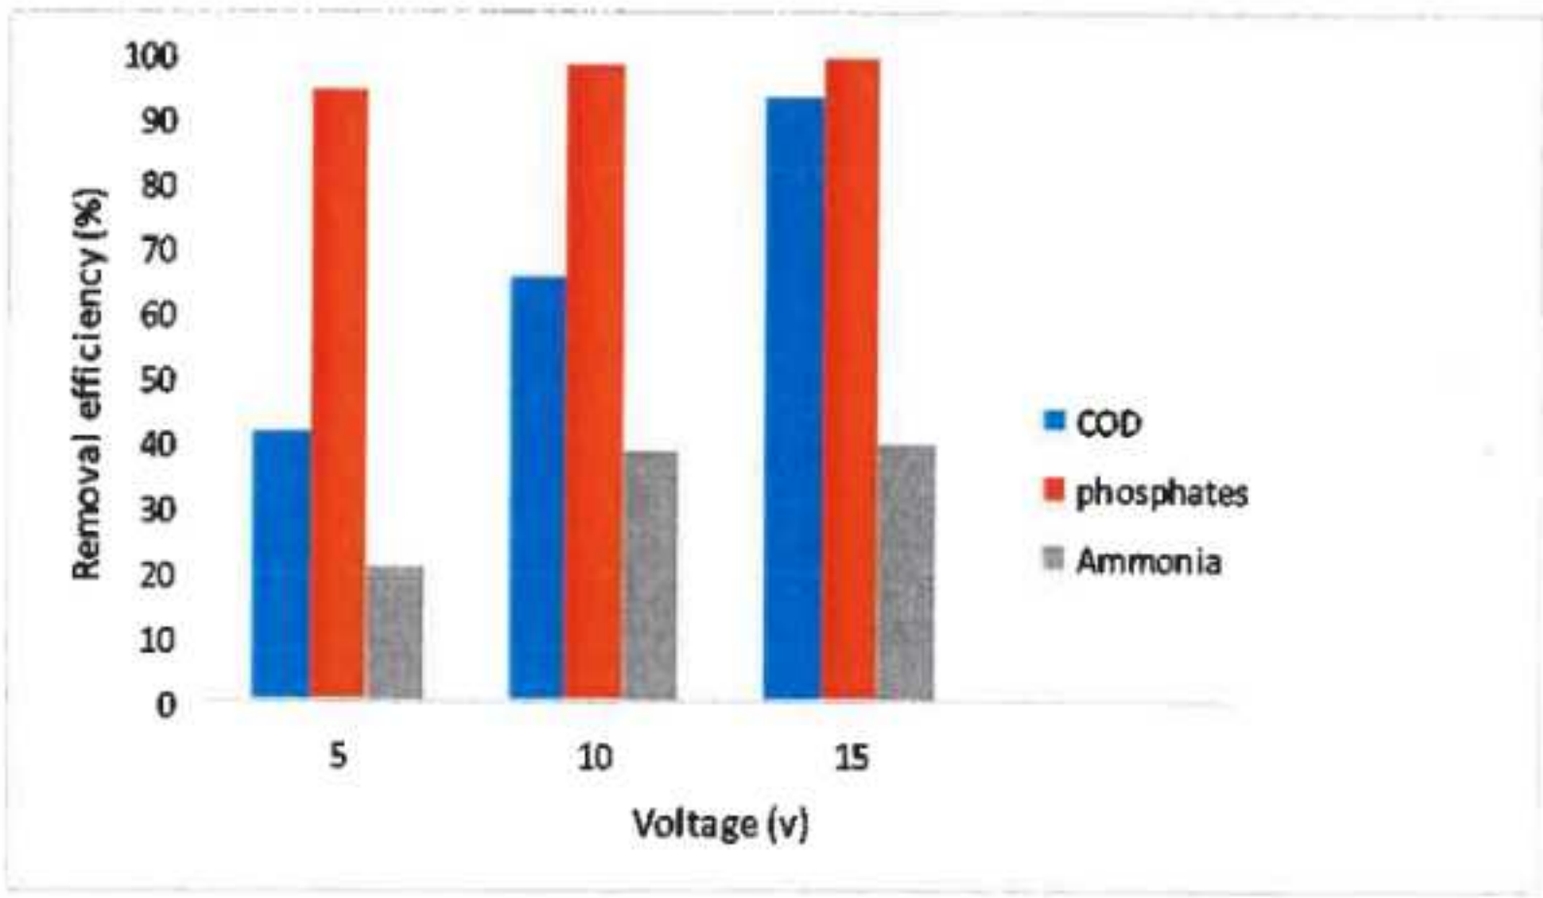

Figure 11: Effect of applied voltage after on removal efficiency 30 minutes treatment

Gawar Construction Limited Dehradun

INI DESIGN STUDIO PVT. LTD. AHMEDABAD

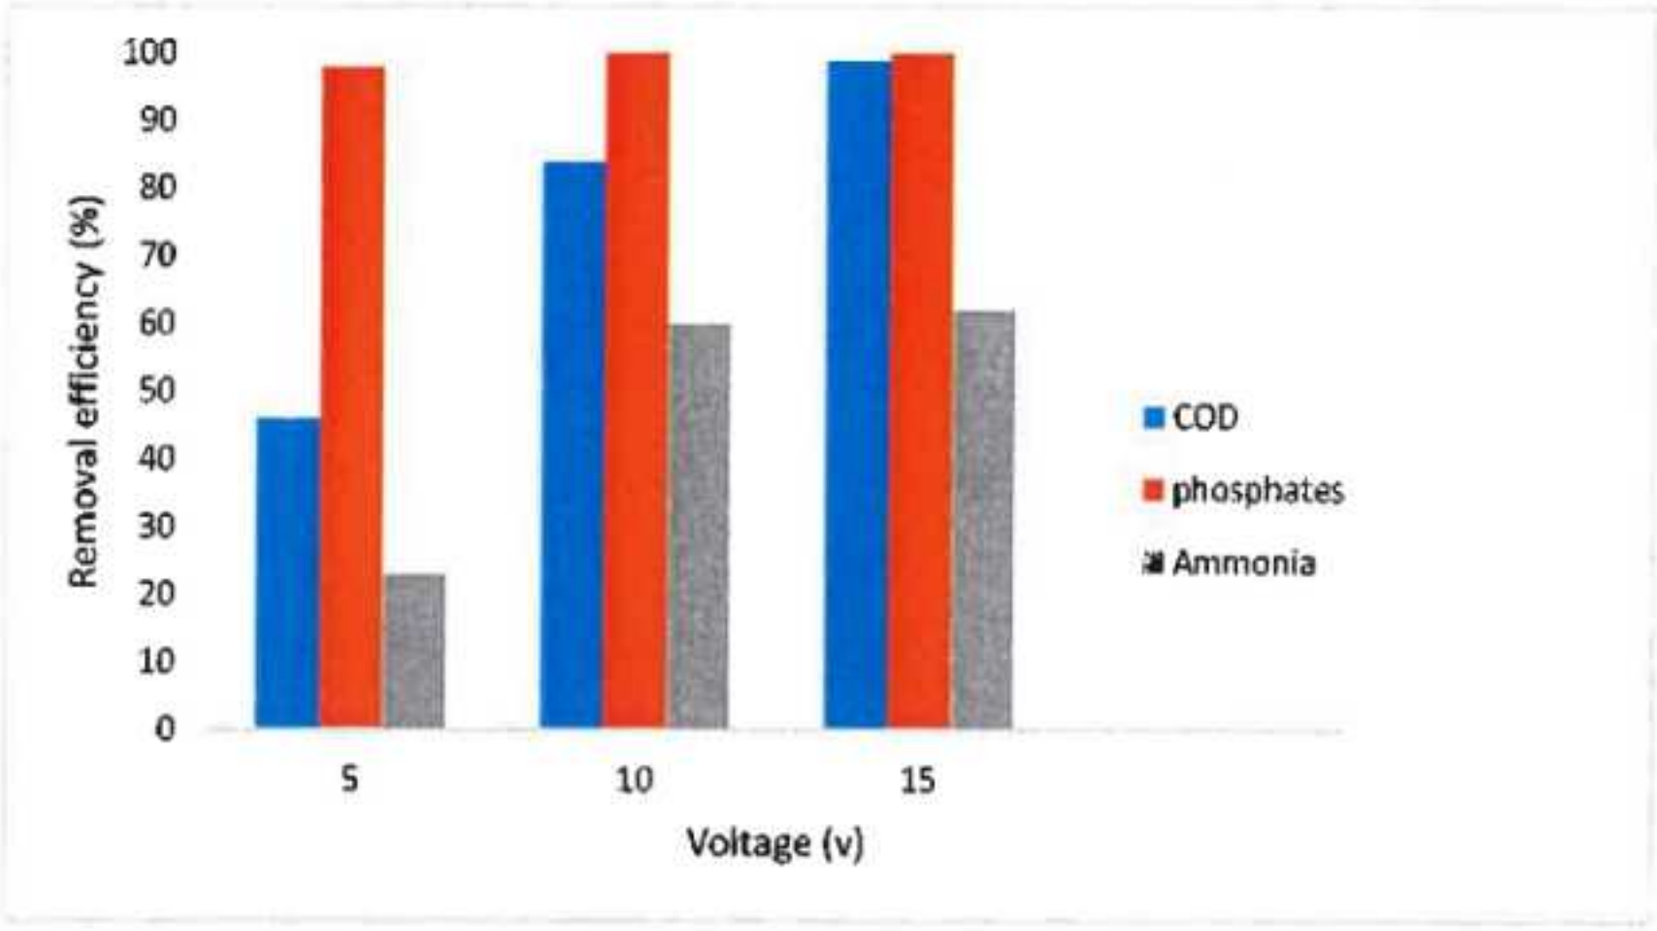

Figure 12: Effect of applied voltage on removal efficiency after 60 minutes treatment

Pollutant removal is observed to also be in accordance with Faraday's law in terms of increase in voltage. Removal efficiencies reached 46%, 84%, 99% for COD at 15 Volts in 60 minutes respectively. High removal efficiency for phosphate was obtained at 5 volts reaching 98% in 60 minutes and 100% at 10 and 15 volts respectively. 23%, 60% and 63% removal efficiencies were obtained for ammonia at 5, 10 and 15 volts.

Effect of passivation

The effects of electrode passivation started developing after the electrodes were used for several different treatments. The effect of the formation of a passive layer was not initially considered but was only noted as after repeating the experiments three or more times.

Table 5: Characteristics of wastewater before and after treatment using passivized aluminium electrodes

5 VOLTS	**Pre-Treatment**	**30-Minutes**	**60-Minutes**
COD (mg/L)	631.7	554.9	534.9
Phosphates(mg/L)	5.72	0.34	0.10
Ammonia (mg/L)	40.5	39.3	36.2
10 VOLTS	**Pre-Treatment**	**30-Minutes**	**60-Minutes**

Ammonia (mg/L)	39.2	36.5	34.5
15 VOLTS	**Pre-Treatment**	**30-Minutes**	**60-Minutes**
COD (mg/L)	722.7	543.5	466.7
Phosphates(mg/L)	6.82	0.06	0.00
Ammonia (mg/L)	41.3	32.2	31.4

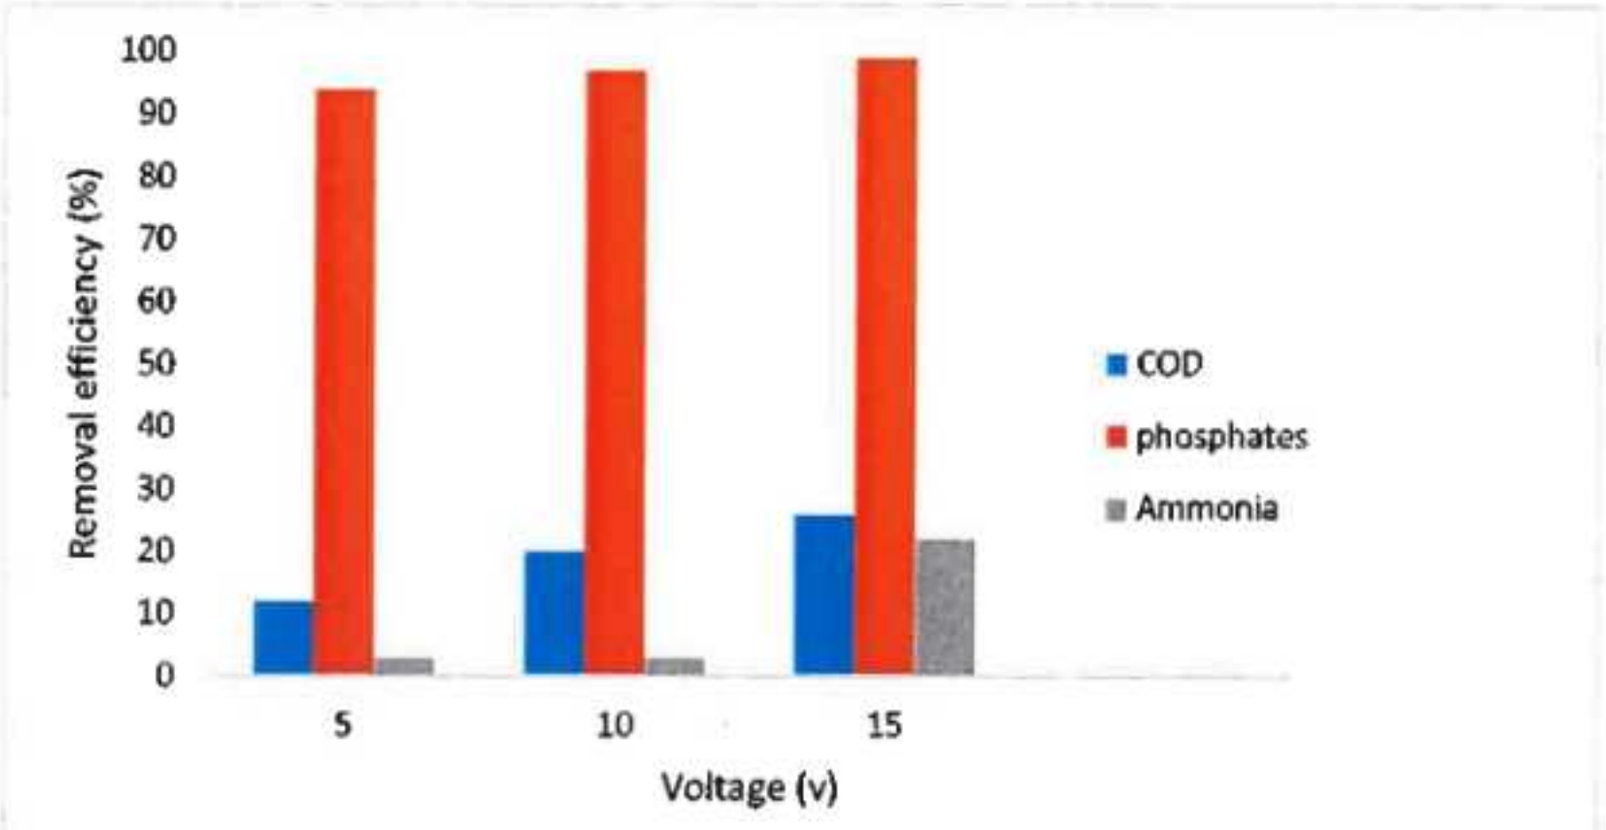

Figure 13: Effect of passivation on removal efficiency after 30 minutes with varying voltage

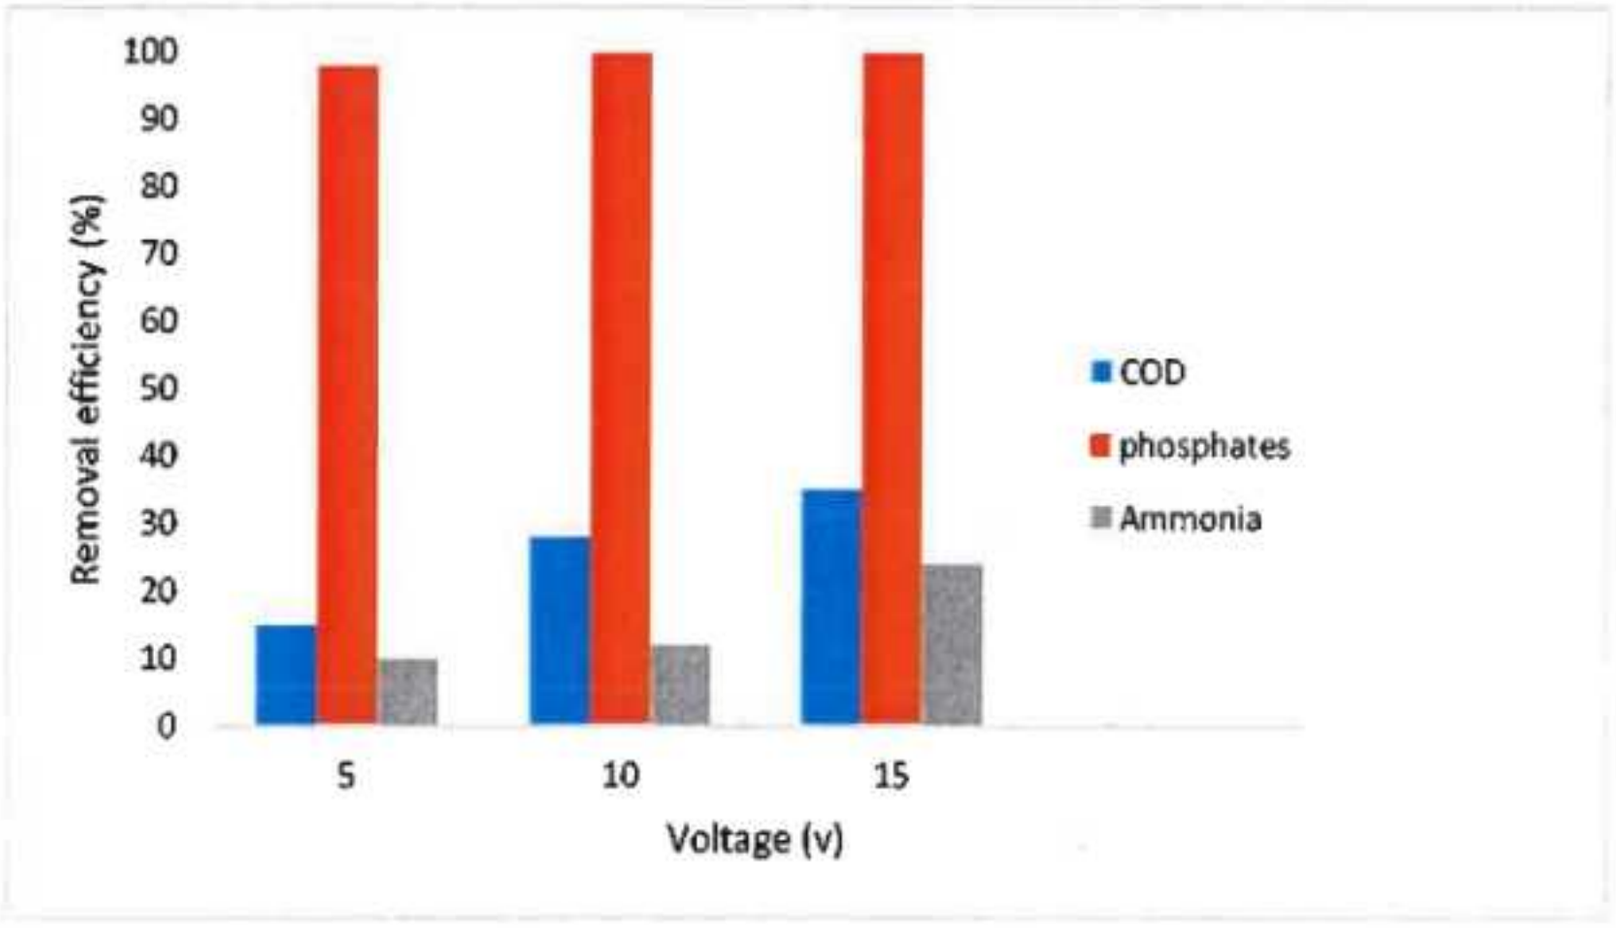

Figure 14: Effect of passivation on removal efficiency after 60 minutes with varying voltage

A decrease in removal efficiency was observed over time as seen in Table 5 and represents the final results using the passivized electrodes. Figures 13 and 14 show that the lowest removal for COD was 12% at 5 volts after 30 minutes treatment and the highest was 24% after 60 minutes treatment for COD. Ammonia removal reduction was also significantly affected by passivation recording such low removal efficiencies as 22% at 5 volts after 30 minutes and 24% was the highest at 15 volts after 60 minutes. Phosphate removal was unaffected by passivation and high removal of 100% was still maintained.

This passivation phenomenon occurred during the process and impeded the oxidation/reduction reactions. The oxide layer reduced the ionic transfer between the anode and the cathode directly, hindering the metal dissolution and indirectly preventing metal hydroxide formation [8].

Application of alternating pulse current

Note should be taken that this method of analyzing the effects of passivation is a novel process. Conductivity of the electrodes is decreased by the formation of the oxide layer, which increases the resistance to the flow of current in the cell.

Table 6: Analysis of conductivity of aluminium before and after treatment using an APC system

Before Treatment		After Treatment	
VOLTAGE	CURRENT	VOLTAGE	CURRENT
2	0.01	2	0.1
3	0.03	3	0.3
4	0.04	4	0.4
5	0.05	5	0.5

The notion of application of alternating pulsed current was brought about to reverse the effects of passivation. At first, manual changing of polarity of electrodes was done after 30 minutes of treatment. From literature passivation must decrease the electrodes' current conductivity, and this is observed in Table 6, the electrodes used had lower conductivity before APC was applied to them. They had a little passivation owing to the treatments they had performed. However, after electrocoagulation with APC their conductivity was observed to increase.

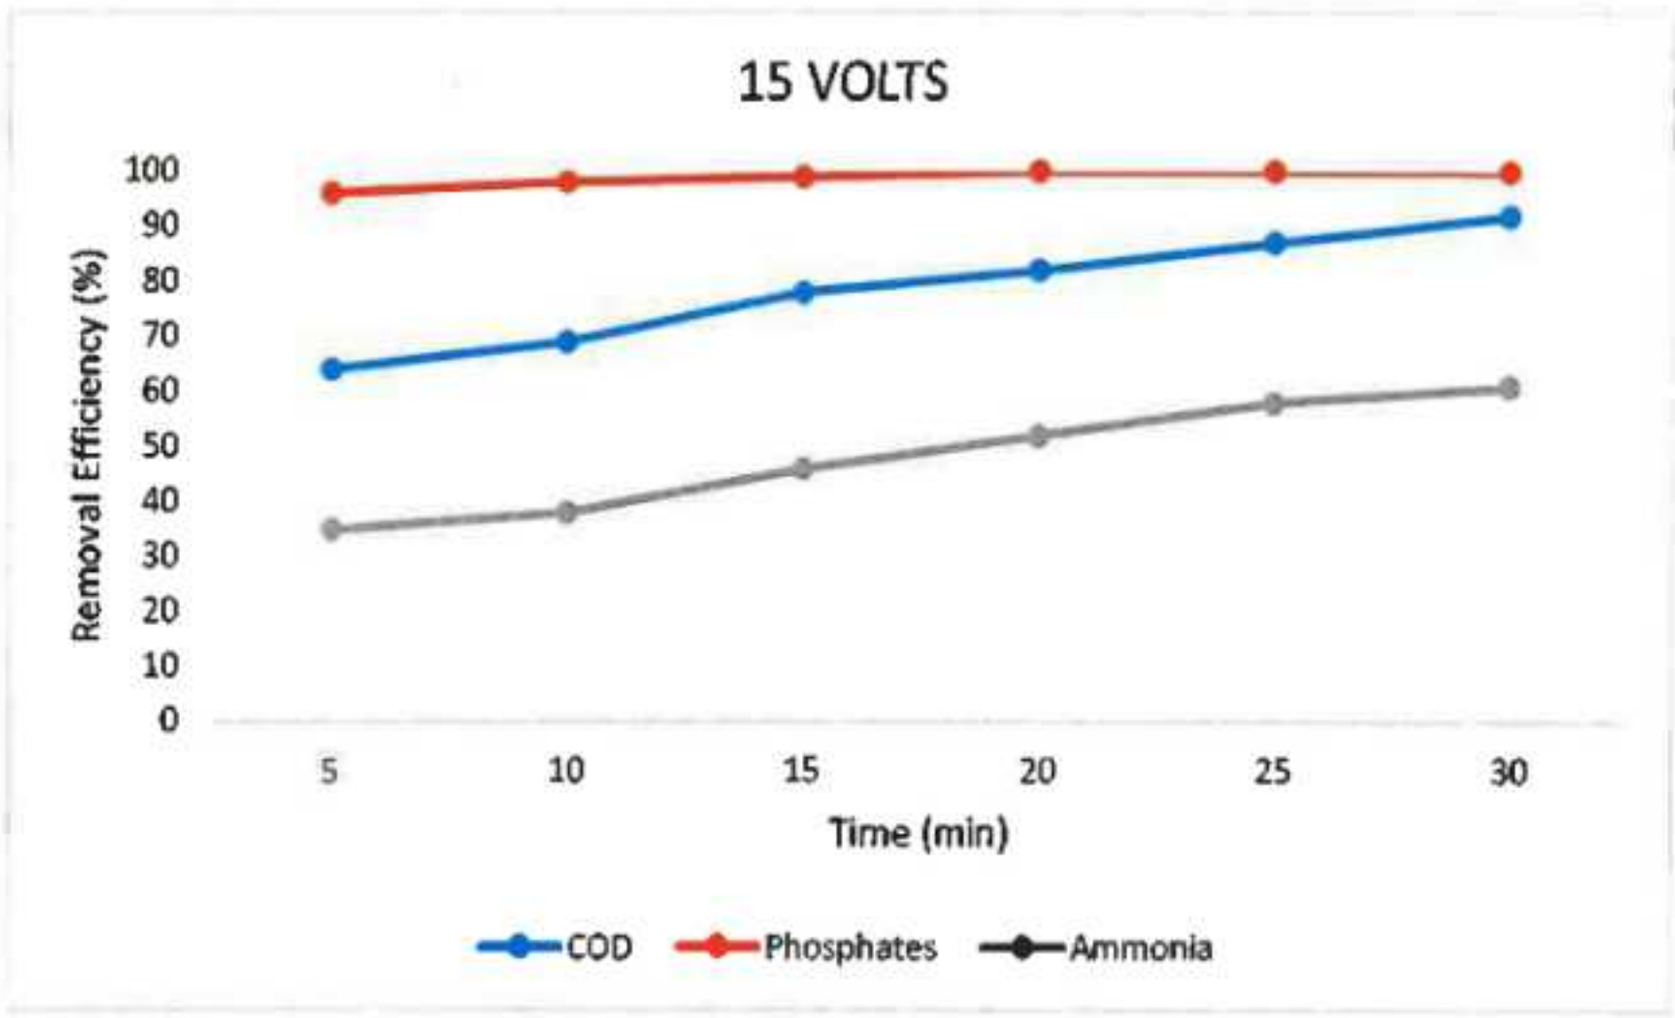

Figure 15: Effect of electrocoagulation on wastewater at 15 volts for 30 minutes using alternating pulse current

According to Figure 15 the rate of pollutant removal is high in the first 5 minutes and the rate decreases as time progresses. As time approaches 30 minutes, rate of pollutant removal decreases and reaches a monotonic state. This may be due to existence of excess colloids for adsorption

CONCLUSION

Electro coagulation was successfully applied for the treatment of municipal wastewater. The study was performed to evaluate the influence of different operational parameters on the reduction of COD, phosphates and ammonia in wastewater. Effects of type of electrode material, treatment time and applied voltage were investigated and the following observations were made:

- Aluminium and Iron were compared and Aluminium gave better results. Aluminium gave 99%, 100% and 62% removal efficiencies for COD, ammonia and phosphates respectively while Iron gave 80%, 100% and 54% removal efficiencies for the same parameters after 60 minutes treatment at 15 volts.
- Applied voltage was varied between 5, 10, 15 Volts. Pollutant removal increased with increasing voltage because of the increased coagulant generation per unit time.15 Volts gave the best results
- Application of alternating pulsed current was effective in reducing the effects

Gawar Construction Limited Dehradun

INI DESIGN STUDIO PVT. LTD. AHMEDABAD

passivation, with the conductivity of the already passivised electrodes increasing after applying alternated pulsed current. This also had the effect of increasing ammonia removal. At 15 volts, 30 minutes without the automated alternating pulsed gave 40% removal while after alternating pulsed current system gave 62% removal at the same time

- Phosphate was the most efficiently reduced pollutant, with 100% reduction being recorded at all voltages, then COD 99% and ammonia 63% at 15 volts.

ACKNOWLEDGEMENTS

Gratitude is extended to the Bulawayo City Council especially to the Technical staff at Thorngrove/Criterion Laboratory were most of the experimental work was carried out.

Plastic bottle collection at Kedar triples from last year

Tanmayee Tyagi@timesgroup.com

Dehradun: Plastic waste management has continued to plague Char Dhum shrines, but officials in Kedarnath have made a significant improvement in PET bottle collection this year compared to 2023. They attributed the success to increased awareness campaigns. The Digital Refund System, initiated last year, allows consumers to claim a Rs 10 refund by scanning a QR code on the wrapper of a plastic bottle.

This system was implemented by the Rudraprayag administration with a Hyderabad-based cleantech startup Recykal.

The campaign was also launched in Chopta in September last year and then in Yamunotri and Gangotri this year. According to data obtained by TOI, the distribution of codes at Kedarnath increased from 3.15 lakh in 2023 to 5.35 lakh this year. The number of bottles collected also rose from 1.63 lakh to 4.1 lakh.

SDM Jitendra Verma said, "When we include the non-DRS bottles, the amount of plastic collected has almost tripled in this one year. We have had tremendous support from the locals along the trek route and the goal is to decentralise the whole process, do away with the need for collection centres and make it a no-waste shrine. In the next phase of the project, we will move on to multi-layered plastics like food wrappers and packets." Local hoteliers and business owners are being engaged to install compacting machines along the yatra route to facilitate responsible waste management. This strategy aims to reduce the need for transportation and preserve resources.

Abhay Deshpande, founder and CEO of Recykal, said, "Our goal is to target 100% collection and ensure zero environmental impact while promoting sustainable tourism in the region. The success of DRS and its expansion has been remarkable and made possible with the support of natives, shopkeepers, distributors, and the local administrations."

A company spokesperson mentioned that a total of 16 lakh codes were distributed this year, resulting in the collection of 11.5 lakh bottles across Gangotri, Yamunotri, Kedarnath, and Chopta. The ultimate goal is 100% collection with zero environmental impact, promoting sustainable tourism in the region.

The success of the Digital Refund System and its expansion has been attributed to the support of natives, shopkeepers, distributors, and local administrations. With a record 54.2 lakh pilgrims visiting the Char Dham shrines this year, waste generation has increased significantly, emphasising the need for large-scale initiatives for source segregation of plastic waste.

According to data obtained by TOI, the distribution of codes at Kedarnath increased from 3.15 lakh in 2022 to 5.35 lakh this year. The number of bottles collected also rose from 1.63 lakh to 4.1 lakh

Introduction:

Waste Management in Kedarnath

Kedarnath, a renowned pilgrimage site nestled in the Himalayan region of Uttarakhand, attracts millions of devotees and tourists annually. With its resident population of 612 (Census 2011) and a floating population averaging 9,334 per day (2024), the town faces significant challenges in managing municipal solid waste. The influx of visitors during peak pilgrimage seasons increases daily waste generation, necessitating robust and sustainable waste management systems.

Currently, the total waste generated in Kedarnath is estimated at 0.147 TPD on average basis while on the basis of highest footfall of 38682 on a single day it may reach upto 1.191 TPD in 2024, projected to rise to 3.049 TPD by 2050 due to population growth and increasing tourist activity. Approximately 60% of the waste is wet (organic), while 40% is dry (recyclables and inert), with varying moisture content impacting processing efficiency.

To address these challenges, a Material Recovery Facility (MRF) has been designed, optimized for the region's limited space and hilly terrain. This facility, spread across 160 m^2 of ground area incorporates advanced waste segregation and processing systems to handle the wet and dry waste streams effectively. The MRF aims to process wet waste through composting and potential biogas generation, while dry waste is segregated into recyclables like plastics, paper, metals, and glass for further recycling.

This initiative represents a critical step towards sustainable waste management in Kedarnath, promoting environmental conservation and enhancing the town's capacity to handle the demands of its growing population and tourism. The facility's design ensures scalability and integration of innovative waste-to-energy solutions for a cleaner and greener Kedarnath.

General Information

- ULB - Nagar Panchayat - Kedarnath
- Current Population - **612**
- Floating Population - **9334** Per day average (Total **1652076** tourist visited till 03-11-2024 in current tourism session with highest footfall of **38682 on 21-05-2024**)

Status of Human Resource

- Total number of Paryavaran Mitra - 50
- Permanent Paryavaran Mitra - 0 1
- Environment Supervisor - 01

Status of SWM/PWM

- Total processed plastic waste - 8.6 tonne(approx.)
- Total income by selling plastic - Rs. 0.51 Lacs
- Solid Wast Collection Vehicle - 01 (mini tractor with trolly)
- Processing Facility - 01 MRF and 01 Bailing machine (for segregation of dry waste)

Status of Sanitation/Toilets

- 22 (20 + 02 Smart Toilets Newly Constructed)
- 02 smart toilets (6 female seat and 6 male seat) have been constructed by Kedarnath Development Authority within Nagar Panchayat Kedarnath area.
- Construction work of 20-Seater and 22-seater public toilets is also in progress.

- Disposal Mechanism- 20 toilets with Soak Pits and 02 Toilets with Soak pit as well as with septic tank.
- Operation and Maintenance- All toilets are maintained by Sulabh International and 04 Paryavaranmitra are deployed for thecleaning of all 20 toilets in 04 location/cluster.

Status of New Initiatives Deposit Refund System (DRS)

The town is a famous tourist spot with high footfall every year. The demographic consists of a significant number of tourists and local businesses, making it an ideal location for implementing innovative waste management solutions like the digital DRS.

Focusing on this urban locality, digital DRS aims to address the waste management challenges in a rapidly growing city. It ensures efficient collection and recycling of PET bottles and other recyclable materials. The initiative also engages the local community, promoting responsible waste disposal practices and environmental awareness.

DRS Progress Status –

- Total QR provided on plastic bottle/tetra pack is 172100
- Out of above 139838 Bottles/Tetra Pack (81%) with QR returned for recycling.
-

Population Growth

- Considering Annual Population Growth Rates:
  - Resident Population: 1.2% per year.
  - Floating Population: Estimate not directly available; assumed proportional to user-provided 2024 data (9,334 for 2024, 3% annual growth).

$$P_t = P_0 \times (1+r)^n$$

Where:

P_t: Population in the target year

P_0: Current population

r: Growth rate (decimal)

n: Number of years

Year	Resident Population	Floating Population (Average)
2011	612	~6,774
2024	735	9334
2034	$735\times(1.012)^{10}=687$	$9{,}334\times(1.03)^{10}=12{,}556$
2044	$735\times(1.012)^{20}=772$	$9{,}334\times(1.03)^{20}=16{,}887$
2050	$735\times(1.012)^{26}=878$	$9{,}334\times(1.03)^{26}=20{,}246$

Waste Generation

- Resident: 0.35 kg/person/day in 2024, increasing by 1% annually.
- Tourist: 0.10 kg/person/day in 2024, increasing by 1% annually.

$$W_t = W_0 \times (1+r)^n$$

Where:

W_t : Waste generation rate in the target year

W_0: Current waste generation rate

r : Growth rate (decimal)

n : Number of years

Year	Resident Waste Generation Rate (kg/person/day)	Tourist Waste Generation Rate (kg/person/day)
2011	0.30	0.05
2024	0.35	0.10
2034	$0.35 \times (1.01)^{10} = 0.386$	$0.10 \times (1.01)^{10} = 0.110$
2044	$0.35 \times (1.01)^{20} = 0.427$	$0.10 \times (1.01)^{20} = 0.122$
2050	$0.35 \times (1.01)^{26} = 0.444$	$0.10 \times (1.01)^{26} = 0.129$

Total Waste Generation

The formula for total waste is:

Total Waste = Population × Waste Generation Rate

Year	Resident Waste (TPD)	Floating Waste (TPD)	Total Waste (TPD)
2011	612×0.30=183.6kg= 0.184TPD	6,774×0.05=1,693.5kg= 0.3387 TPD	0.184+0.3387= **0.5227 TPD**
2024	735×0.35=257.25kg= 0.257TPD	9,334×0.10=2,800.2kg= 0.9334 TPD	0.257+0.9334= **1.1904 TPD**
2034	822×0.386=317.29kg= 0.317TPD	12,556×0.110=4,155.03kg= 1.3811 TPD	0.317+1.3811= **1.6981 TPD**
2044	919×0.427=392.91kg= 0.393TPD	16,887×0.122=6,183.64kg= 2.0602 TPD	0.393+2.0602= **2.4532 TPD**
2050	985×0.444=437.34kg= 0.437TPD	20,246×0.129=7,716.73kg= 2.6117 TPD	0.437+2.6117= **3.0487 TPD**

Final Summary:

Year	Resident Population	Floating Population	Resident Waste (TPD)	Floating Waste (TPD)	Total Waste (TPD)
2011	612	6,774	0.184	0.338	0.522
2024	**735**	**9,334**	**0.257**	**0.934**	**1.191**
2034	822	12,556	0.317	1.381	1.698
2044	919	16,887	0.393	2.060	2.453
2050	985	20,246	0.437	2.612	3.049

Waste Composition:

- Wet Waste: 60% of total waste (kitchen waste, food scraps, etc.).
- Dry Waste: 40% of total waste (plastics, paper, metals, etc.).

Moisture Content:

- Wet Waste: 70% moisture.
- Dry Waste: 10% moisture.

Dry Waste Segregation:

- Plastics: 40%
- Paper/Cardboard: 30%
- Metals: 10%
- Glass: 10%
- Other (Rubber, textiles, etc.): 10%

Wet and Dry Waste with Moisture Content

Year	Total Waste (TPD)	Wet Waste (60%) (TPD)	Dry Waste (40%) (TPD)	Wet Waste (After Moisture) (TPD)	Dry Waste (After Moisture) (TPD)
2011	0.522	0.313	0.209	0.313×(1−0.7)=0.094	0.209×(1−0.1)= 0.188

- Objective: Design a facility capable of handling **1 TPD** (including future scalability).
- Available Area: Total Area 0.30 hectare

Proposed Design

The facility will adopt a compact and efficient layout tailored for hilly terrain with modular machinery.

Wet Waste Processing:

- Organic Waste Composter: Suitable for food and organic waste
  (1 Nos. of 500 Kgs in MRF and 8 Nos. of 50 Kgs in Route to Kedarnath)
- Biogas Generation: Option for future integration.

Dry Waste Processing:

- Segregation: Focus on plastics, paper, metals, glass, and other materials.
- Baling/compactor: Compact packaging for recyclables.
- Magnetic Separator: For metal waste.
- Manual Sorting: For finer segregation where needed.

Dry Waste Segregation Process (Partwise Breakdown)

- Plastics (40%): Recyclable plastics processed, sorted, and sent for baling or direct sale.
- Paper/Cardboard (30%): Sorted, compacted into bales for recycling.
- Metals (10%): Separated using magnetic separators; compacted for sale.
- Glass (10%): Collected separately for recycling, handled with care due to fragility.
- Other (10%): Textiles, rubber, and other recyclable materials sorted and processed accordingly.

1. Facility Layout

MRF Centre (160 m^2)

Section	Nos./ Qty.	Area Allocation (m^2)	Description
Receiving Area & Tipping Area	1	20	For unloading and initial segregation of dry waste from collection vehicles.
Sorting/Processing Area	1	90	Manual sorting area with flat sorting conveyor belts Includes OWCs, conveyor belts, ballistic separator, and magnetic separator.
Bale Storage/ Dispatch Area	1	15	For storing compressed bales of recyclables like plastics, paper, and metals. And ready to move for the recycler.
Office with toilet	1	10	Includes supervisor's office, rest area, and hygiene facilities with Separate facilities for male and female workers.
Security Cabin	1	10	Located near the entry for weighing incoming and outgoing waste loads.
Weigh Balance/Machine	1	5	At the main entrance to monitor entry and exit of vehicles.
Miscellaneous Space/ (Pathways and emergency exits)	1	10	For pathways, circulation, and additional storage.

2. Machinery and Equipment

Essential Machinery

Machinery	Specifications	Quantity
Weigh Balance/Machine	1 Ton	1
Ballistic Separator	Capacity: 5–10 TPD, adjustable paddles	1
Magnetic Separator	High-intensity, auto-cleaning	1
Conveyor Belts	Flat type, 7.8 m & 4 m lengths (2 units)	2
Hydraulic Compactor Machine	Vertical, Single Cylinder, 25 Tonne (Jack force)	1
HDPE Wheeled Bins	Capacity: 100 Liters	10
Organic Composter Machine	Capacity: 50 Kg	8
	Capacity: 500 Kg	1
Pallet Truck	Manual, 1 T capacity	1

Proposed Sites (8 Locations) for the Installation of 50 Kg capacity Organic Waste Composter and HDPE Wheeled Bins-

1) Sitapur, 2) Sonprayag, 3) Gaurikund, 4) Jungle chatti, 5) Bhim bali, 6) Choti lincholi, 7) Badi lincholi, 8) Base camp

3. Operational Plan

Workflow:

1. **Receiving and Sorting**:
   - Waste unloaded into receiving area.
   - Conveyed to sorting conveyor for manual segregation.
2. **Mechanical Processing**:
   - Ballistic separator separates 2D (plastics, paper) and 3D (bottles, cans) materials.
   - Magnetic separator removes ferrous materials.
3. **Baling and Storage**:
   - Sorted materials compressed into bales.
   - Bales stored in basement storage area.
4. **Dispatch**:
   - Processed materials dispatched to recyclers periodically.

Workforce Requirements:

Role	Number	Responsibilities
Supervisor	1	Oversee operations, manage records.
Sorting Workers	6	Manual segregation of waste.
Baler Compactor Operator	1	Operate baling machine.
Security Personnel	2	Monitor entry/exit, manage weighbridge.

Suggested Placement of Equipment:

Weight Balance Machine: Place in the Weighing Area to align with its purpose. This ensures incoming and outgoing materials are properly weighed before or after processing.

Ballistic Separator: Place in the Sorting Area as it is critical for segregating lightweight and heavy materials during sorting.

Magnetic Separator: Place adjacent to the Ballistic Separator in the Sorting/Processing Area to separate ferrous metals efficiently after initial sorting.

Conveyor Belts: 4m Conveyor Belt: Place between the Receiving/Tipping Area and the Sorting Area to transport materials for processing.

8m Conveyor Belt: Place between the Sorting/Processing Area and the Bale Storage/Dispatch Area to move processed materials for storage or dispatch.

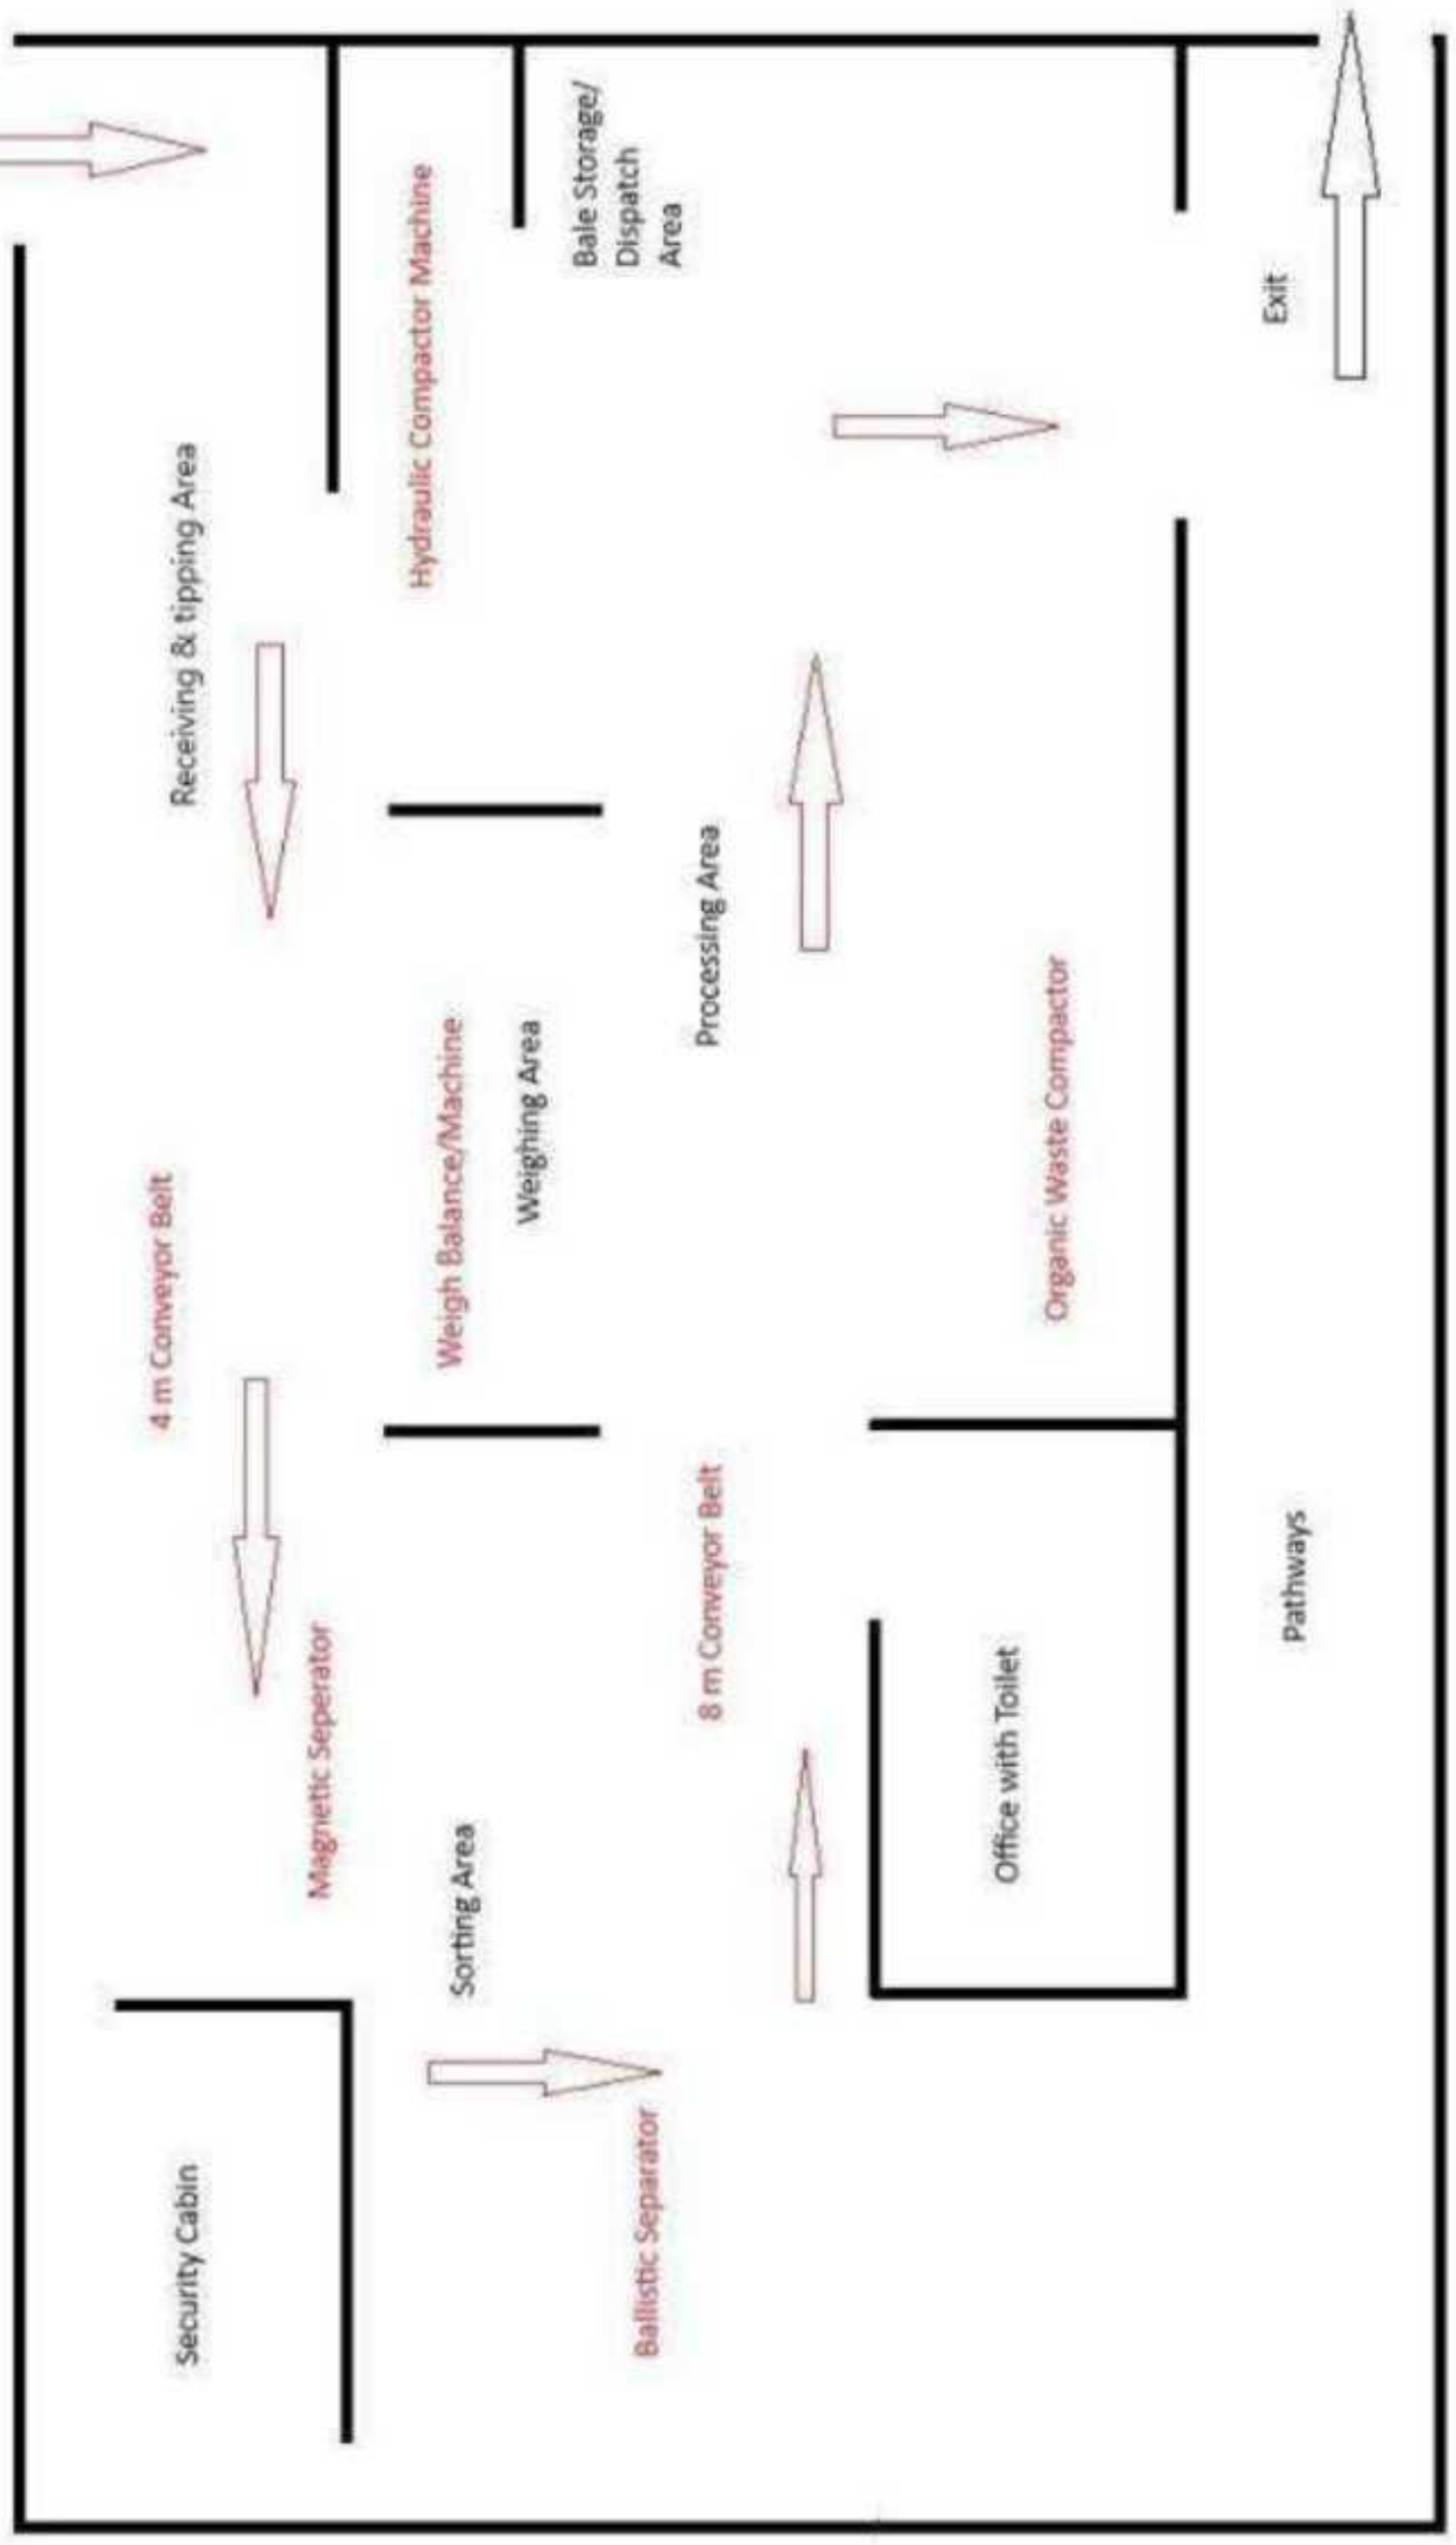
Hydraulic Compactor Machine: Place in the Bale Storage/Dispatch Area as it compacts recyclable materials into bales ready for dispatch.

Organic Waste Compactor Machine: Place near the Sorting/Processing Area or along the Pathways, close to where organic waste is sorted, to handle organic material efficiently.

Cost Estimates

Operational Expenditure (OPEX)

S.No.	Component	Annual Cost (₹)
1	Salaries	15,00,000
2	Electricity & Maintenance	5,00,000
3	Water Supply	1,00,000
4	Miscellaneous	3,00,000
Total		**₹24,00,000/year**



Basic MRF Floor Plan for 10 m * 16 m (160 Sq. M.) Area

Name of work-Construction of Shed,Protection Work and G.I sheet Covering for MRF centre in Kedarnath.

SUMMARY OF COST

S.N	Particular of items	Nos	Cost(in lakh)	Amount
1	Cost of Shed.(16 X 10)m	1	72.35	72.35
2	Proposed Construction of Protection work & G.I sheet Covering for MRF centre in Kedarnath.	1	46.37	46.37
			Total	118.72
	Contigencies@5.00%			5.94
			Grand Total	**124.66**

Name of work: Construction of MRF Shed in Kedarnath .

Bill of Quantity

S.N.	Item of work	Quantity	Unit	Rate	Amount
1	Earth work in excavation by mechanical means (Hydraulic excavator) / manual means in foundation trenches or drains (not exceeding 1.5 m in width or 10 sqm on plan), including dressing of sides and ramming of bottoms, lift upto 1.5 m, including getting out the excavated soil and disposal of surplus excavated soil as directed, within a lead of 50 m.	37.31	cum	737.00	27495.44
2	Providing and laying in position cement concrete 1:4:8 excluding the cost of centering and shuttering i/c all.	23.83	cum	16678.00	397474.27
3	Providing and laying in position specified grade of reinforced cement concrete, excluding the cost of centering, shuttering, finishing and reinforcement -All work up to plinth level: 1 :1.5:3 (1 cement : 1.5 coarse sand (zone-III) derived from natural sources : 3 graded stone aggregate 20 mm nominal size derived from natural sources) i/c all.	29.54	cum	27316.00	806941.96
4	Centering and shuttering including strutting, propping etc. and removal of form for Foundations, footings, bases of columns, etc. for mass concrete i/c all.	79.20	sqm	1572.00	124502.40
5	Steel reinforcement for R.C.C. work including straightening, cutting, bending, placing in position and binding all complete upto plinth level.	3478.45	kg	179.00	622643.04
6	Steel work in built up tubular (round, square or rectangular hollow tubes etc.) trusses etc., including cutting, hoisting, fixing in position and applying a priming coat of approved steel primer, including welding and bolted with special shaped washers etc. complete.	10695.40	kg	303.00	3240706.20
7	Random Rubble stone masonary laid in 1:6 cement and sand mortar i/c all.	6.18	cum	13056.70	80721.74
8	Filling available excavated earth (excluding rock) in trenches, plinth, sides of foundations etc. in layers not exceeding 20cm in depth, consolidating each deposited layer by ramming and watering, lead up to 50 and for all lift.	52.10	cum	580.00	30215.68

9	Providing corrugated G.S. sheet roofing including vertical I curved surface fixed with polymer coated J or L hooks, bolts and nuts 8 mm diameter with bitumen and G.I. limpet washers or with G.I. limpet washers filled with white lead, including a coat of approved steel primer and two coats of approved paint on overlapping of sheets complete (up to any pitch in horizontal/ vertical or curved surfaces), excluding the cost of purlins, rafters and trusses and including cutting to size and shape wherever required. 0.63 thick with zinc coating not less than 275 gm/m2	228.42	sqm	1695.00	387165.12
10	Providing ridges or hips of width 60 cm overall width plain G.S. sheet fixed with polymer coated J or L hooks, bolts and nuts 8 mm dia G.I. limpet and bitumen washers complete. 0.80 mm thick with zinc coating not less than 275 gm/m2	16.60	m	1083.30	17982.78
11	Providing and fixing 15 cm wide, 45 cm overall semi-circular plain G.S. sheet gutter with iron brackets 40x3 mm size, bolts, nuts and washers etc., including making necessary connections with rain water pipes complete. 0.80 mm thick with zinc coating not less than 275	33.20	m	1029.65	34184.38
12	Providing and fixing 1 mm thick M.S. sheet door with frame of 40x40x6 mm angle iron and 3 mm M.S. gusset plates at the junctions and corners, all necessary fittings complete, including applying a priming coat of approved steel primer.	12.00	sqm	9937.00	119244.00
13	Providing and laying in position cement concrete of specified grade excluding the cost of centering and shuttering - All work up to plinth level: 1 :2:4 (1 cement : 2 coarse sand (zone-III) derived from natural sources : 4 graded stone aggregate 20 mm nominal size derived from natural sources)	20.13	cum	23368.00	470281.00
14	Providing and fixing of Puf pannel to walls as per required shape and design directed by engineer in charge including material,labour and all fixing.(Rates taken as per Gem portal)	196.00	Sqm	3900.00	764400.00
15	Painting Steel work with Deluxe Multi Surface Paint to give an even shade. Two or more coat applied @ 0.90 ltr/10 sqm over an under coat of primer applied @ 0.80 ltr/10 sqm of approved brand and manufacture i/c all.	238.90	Sqm	255.00	60919.50
				TOTAL=	7184877.51
	Add cartage for item no 10,11 & 14 due to rates are taken from DSR 2023 and Gem portal.			L.S	50000.00
				G. Total	7234877.51

Product Compare Product History 4

744

Product feature	Consist of an insulating layer of rigid polyurethane foam between two layers of metal sheets
Panels For	Wall
Types of panel	Single groove panels – for general purpose an application in building / shelters
Facility of tongue-n-groove joinery for wall panels	Yes
Fire class	FR grade (fire resistance grade)
External pattern of panels	As per Buyer's requirement
Provision of male-female type groove made with extended wall panel sheets	Yes
Provision of cam lock system	No
Scope of supply(offer price to include all cost component)	Supply of Product only
Transportation / freight charges	Offer prices are on free delivery at consignee site basis
Foundation for panels	Building of foundation at site shall be the responsibility of the consignee and the seller shall install / erect and commission the structure on the foundation constructed up to plinth level by the consignee

Features	Higher throughput rates, Low operating costs,...
Material	Municipal Solid Waste
Automation Grade	Manual

SVM Infraestate Ballistic separators are designed for sorting 2D materials (plastic film, paper, cardboard and fibres) and 3D materials (containers, plastic bottles, cans, stone, wood, etc.). They can also sort fine particles that can be collected separately with the optional variable screen openings.
A ballistic separator is a high load segregating device that separates out wastes of different kinds. It consists of parallel agitating paddles and a deck that oscillates at high speed so as to sort a stream of waste passed through it.

Separates Waste Into 3 Fractions - They can also sort fine particles which, with the optional variable screen openings, can be collected separately.

- Lighter material which moves upwards due to eccentric motion supported by a fan which mainly contains plastic papers, wrappers, cloth, papers etc.
- Heavier/3D material – which is heavy in weight and slides down on the paddles to the bottom & gets separated which mainly contains C&D waste, coconut shells, glass, metals, footwear & pet bottles
- Minus material which screens down from the mesh paddling system normally contains earth and other smaller size material

Usage/Application	Material Handling
Brand	VEPL
Capacity	100kg
Material	Mild Steel
Belt Material	PVC
Belt Width	500-1200mm
Voltage	415V
Belt Speed	0-60mtr/min
Warranty	1 year
Model Name/Number	VEPL-FBC
Country of Origin	Made in India

Product Video Product Brochure

A **conveyor belt** is the carrying medium of a **belt conveyor system** (often shortened to belt conveyor). A belt conveyor system is one of many types of conveyor systems. A belt conveyor system consists of two or more pulleys (sometimes referred to as drums), with a closed loop of carrying medium—the conveyor belt—that rotates about them. One or both of the pulleys are powered, moving the belt and the material on the belt forward. The powered pulley is called the drive pulley while the unpowered pulley is called the idler pulley. There are two main industrial classes of belt conveyors; Those in general material handling such as those moving boxes along inside a factory and bulk material handling such as those used to transport large volumes of resources and agricultural materials, such as grain, salt, coal, ore, sand, overburden a nd more.

Ragnor Hydraulics" is located in **IMT Manesar, Gurgaon** and the working area is 10000 sq. feet. Many years of research & development, vast experience & production capabilities has earned a reputed name in the field of High Technology Quality Products. Our company is equipped with in-house computer aided designing and manufacturing facilities and supplying machines to top Indian companies.

A sound establishment of Ragnor Hydraulics in **2016** has made a rapid growth in the Indian market. We are engaged in **Manufacturing, Suppling & Exportering** a vast assortment of**Car Lifts, Dock Leveler, Hydraulic Scissor Lift, Hydraulic Cutting Machine, Hydraulic Power Packs, Hydraulic Cylinders, Container Tilters, Hydraulic Goods Lift, Hydraulic Presses, Industrial Sheds, Baler And Baling Press Machine, Drum Crushers And Compactor, etc.**

Our dedicated and highly proficient team of engineers is constantly involved in the process of production. Our in-house production line allows us to undertake orders as per the specific requirements of our esteemed clients. Our products have established a sound recognition in the various markets which brings us repeated orders. At Ragnor Hydraulics, we have a separate quality control department who ensure that every machine is tested for quality and performance. We guarantee all our customers that our manufactured hydraulic presses pass strict and complete quality controls. Our timely after-sale services are also dedicated to fulfill the customer's hour of need.

In addition to this, we also render optimum quality **Annual Maintenance Contract Service** and **Hydraulic Press Job Work.** Under the guidance of **"Mr. Ravinder Kaushik" (CEO),** we have been able to provide maximum satisfaction to our clients.

N.P.A./2022- 381
Office of Nagar Panchayat Arki,
Teh. Arki, Distt. Solan (H.P.)

Date: Arki, 11, April,2022

To whom it may concern

This is to certify that, we are using OWC 500 KG per day capacity supplied by M/s. Excel Industries Ltd. for decentralised waste management system in our town, Arki, District Solan, Himachal Pradesh. Around 500 kg wet waste is treated by use of Bioculum and Sanitreat and they are working satisfactory without any operational issues.

The system and use of Bioculum and Sanitreat helping us dispose off the wet waste with reduced composting cycle to 10 days and eliminating foul odour during composting process. We place on record our appreciation for the M/s EXCEL Industries Limited, for making the composting process easier and efficient.

Secretary
Nagar Panchayat Arki.

mc/swm/2022-1802 Dt. 12/4/2022

To whom so ever it may concern

We adopted decentralised waste management system in our town in the year 2021. Around 1000 kg wet waste is treated by use of Excel Industries Ltd's OWC machine along with Bioculum and Sanitreat.

OWC machine shreds, homogenises wet waste with horticulture waste like dry grass, dry leaves. Bioculumis mixedWet Waste to for accelerate the composting process and Sanitreat is used to control foul odour. OWC machine and its shredders are working satisfactorily without any operational issues.

Use of OWC, Bioculum and Sanitreat has brought efficiency in handling wet waste and reduced the composting cycle to 10 days and eliminating foul odour during composting process. We place on record our appreciation for the M/s EXCEL Industries Limited, for making the composting process easier and efficient.

Thanking you,

Yours truly,

Executive Officer

Municipal Council
