6.1 Illegal Mining Activities

a) The committee visited the alleged Balughats No. 4, 9, 21, 22, 23, and 24. It was observed that Balughats No. 4, 9, 21, and 23A were operational and being utilized for sand excavation with valid Lease Agreements, Consent to Operate (CTO), Consent to Establish (CTE), and Environmental Clearance (EC). No evidence of illegal mining activities was observed at these locations.

b) The committee observed that Balughats No. 22A, 22B, 22C, 23B, 23C, 24A, 24B, and 24C were non-operational and in the process of either allotment or obtaining necessary approvals, such as EC or CTO.

c) The committee noted that the Balughats 4, 9 & 21 were not registered under the name of Mr. Uday Singh. The Balughat No. 4 was registered under proprietor Rangesh Kumar Gautam (M/s OM Enterprises), The Balughat No.

9 and Balughat No. 21 were registered under proprietor Babita Sinha (M/s Gautam Filling Centre), The Balughat No. 23A was registered under proprietor Upendra Singh (M/s Upendra Nikhil High-tech Construction Pvt. Ltd). The work order issued Balughat No. 4, 9, 21, 23A by District Mining Office; Aurangabad is attached as **Annexure 5**.

As per the Bihar Sand Mining Policy, 2019, Any individual / registered companies / partnerships / Societies including co-operative societies shall be eligible to bid for maximum two sand blocks or up to an area of 200 hectares whichever is less (**Annexure 6**)

6.2 Sand Transportation below the National Highways and Railway Bridge

a) No traces of mining activities were observed under or near the bridges.

b) Mining activities were carried out approximately 1.5 km away from the bridges.

c) Heavy vehicles were observed using the underpass beneath the two parallel railway bridges (between Pillar No. 45 and 46), and two parallel road bridges (P-49 and P-50).The kaccha roads under these bridges are away from the pillars.

6.3 Loss of Government Revenue

As per the Bihar Sand Mining Policy, 2019 - "*the settlee shall make sale of sand to all consumers, small, medium or large, either through online or offline mode. All transactions/ payments, excavation, production/ transportation, stocking details shall be captured through the departmental online real time monitoring system. Sale of sand shall be controlled by electronic documentation linked to a central documentation monitoring facility and all lease shall upload a monthly progress report on department portal without fail*". The Challans generated for the sale of sand are attached as **Annexure 7**.

The Committee observed that the sand mining is taking place in controlled and regulated manner.

6.4 Compliance and Monitoring, as observed by the committee

The Committee observed the following regarding compliance and monitoring of sand mining activities:

a) The Detailed Sand Mining Report (DSR) is available for the operational Balughat, which includes plot numbers 4, 9, 21, and 23A. Mining activities are being carried out in accordance with the DSR guidelines. The most recent Replenishment Study was conducted in 2022.

b) Pillars installed for demarcating the allowable sand mining areas in the plots 4, 9, 21, and 23A, where leases have been granted for sand mining. The geographical coordinates (latitude and longitude) for these pillars are provided in the relevant section of the report (see Table 1). Signboards displaying the source details, deposit quantity, area, and license information have been erected (see Figures 6, 7, 12, and 13).

c) According to the Enforcement & Monitoring Guidelines for Sand Mining (2020) and the Bihar Sand Mining Policy (2019), the mining depth is restricted to 3 meters, and the distance from the riverbank must be ¼th of the river width, with a minimum distance of 7.5 meters. The committee confirmed that mining at Balughat plots 4, 9, 21, and 23A has not exceeded the 3-meter depth limit and that the mining activities are being conducted at a distance greater than 11 meters from the riverbank. As per the Environmental Clearance (EC) conditions, "the extraction will be carried out up to a maximum depth of 3 meters from the surface of the mineral deposit and no less than 1 meter from the water level of the river channel, whichever occurs earlier."

d) The District Administration conducts monthly monitoring of the sand ghats/blocks through Unmanned Aerial Vehicles (UAVs)/Drone surveys.

e) CCTV cameras have been installed by the District Administration to ensure transparency in the operation of sources and the transportation of materials (see Figure 14).

f) The District Administration carries out real-time monitoring of transport vehicles, such as trucks, equipped with GPS tracking, from the sand sources to the end users.

g) Sand excavation is carried out using semi-mechanized machinery, in compliance with EC conditions (see Figures 6, 7, and 12).

h) A weighbridge has been installed to weigh the loaded vehicles. Excess sand is unloaded from the vehicles and stored near the bridge, where it is periodically removed by other vehicles.

i) Sand is stored at the designated Secondary Loading Point before being transferred to other vehicles for sale.

j) As per the Sustainable Sand Mining Management Guidelines (2016), Enforcement & Monitoring Guidelines for Sand Mining (2020), and the Bihar Sand Mining Policy (2019), mining depth is restricted to 3 meters, and the distance from the riverbank should be ¼th of the river width, with a minimum of 7.5 meters.

k) The committee confirmed that mining at Balughat plots 4, 9, 21, and 23A is carried out within the prescribed limits, with a maximum depth of 3 meters and a distance of more than 11 meters from the riverbank. In accordance with the EC conditions, extraction is carried out up to a maximum depth of 3 meters from the surface of the mineral deposit, but no less than 1 meter from the water level of the river channel.

Based on these observations, it can be concluded that the four operational ghats are complying with the MoEF&CC's guidelines for sand mining activities.

Procedure and parameters laid down in the policy of Sustainable Sand Mining Management Guidelines 2016 (SSMMG 2016) and Enforcement & Monitoring Guidelines for Sand Mining 2020 (EMGSM 2020).

AGENDA ITEM NO. 4

District Survey Report for Aurangabad district (E-mail dated:- 22.12.2021 and Hard Copy Received date:- 22.12.2021).

Application along with letter from District Magistrate vide letter No. 1680, dated 22.12.2021 was submitted to SEAC, Bihar on 22nd December, 2021 for the evaluation of the District Survey Report (DSR).

Observations of the Committee:-

I. The presentation of the Aurangabad district was good and the map of sand ghat (proposed and existing) was shown in the proper manner. However, DSR needs to require more improvement as per the guidelines.

II. Average length and width of river and all the proposed sand ghats not provided. To check the proportion of the total river length/area taken up for sand mining in the light of the provision that only 60% of the river area should be allowed for sand mining in a District.

III. Clear and high resolution color images of the proposed ghats should be submitted with DSR including the date of photographs/ GPS location for identification of potential sand mining area,

IV. Why so much sand mining from small tributaries, if demand is fulfilled. This has to be justified.

AGENDA ITEM NO. 5

District Survey Report for Bhagalpur district (E-mail dated:- 27.12.2021 and Hard Copy Received date:- 22.12.2021).

Application along with letter from District Magistrate vide letter No. 1584, dated 22.12.2021 was submitted to SEAC, Bihar on 22nd December, 2021 for the evaluation of the District Survey Report (DSR).

Observations of the Committee:-

I. Bhagalpur Channan - 03 sand ghat of 02 points has entered in the river. Below 02 pins have to be in upwards direction.

IV. Many sand ghat on the meandering point/ concave of the river (Rajwara Sand ghat, Sikandarpur Sand Ghat, Koluhan Sand Ghat, Harpur Sand Ghat and Gosaipur Sand Ghat). These ghats should be dropped to prevent river bank erosion.

V. KML file was not submitted.

VI. Ramauli sand ghat on Gandak River was proposed on Aquatic Animal Habitation Area. The ghat has to be dropped.

VII. No Mining activity should be done within 10 km periphery of Muzaffarpur city/Urban area, which is a non-attainment city with respect to air pollution. This will help check the air pollution in Muzaffarpur city.

VIII. Clear and high resolution color images of the proposed ghats should be submitted with DSR including the date of photographs/ GPS location for identification of potential sand mining area.

IX. Many existing ghats then whey proposing new ghats? Please justify.

X. Satellite image is not clear. Sites mentioned are not clear. Two colours? Please provide clear images.

Resolution of the Committee:-

The Committee observed that the draft District Survey Report (DSR) was not in proper format with all required documentation along with maps as well KML files. Based on discussion, the Committee sought the following revised information from the concerned Districts (**Agenda Item No. 01 to 38**) along with hard copy as well as soft copy (Word file searchable format) A part from the above observations of SEAC the following observation would also be incorporated while preparing the revised DSR.

1) Justify the reasons for locating each sand mining ghat.

2) Many Districts are already having a large number of existing mining ghat. Their detailed analysis of ground level, area demarcation, aggradation, degradation, depth of mining, side slopes, width and cross sections should be presented to the committee.

3) The specific gravity of the material also needs to be ascertained by analyzing the sample from a NABL accredited lab.

4) The permanent boundary pillars need to be erected after identification of an area of aggradation and deposition outside the bank of the river at a safe location for future surveying. The distance between boundary pillars on each side of the bank shall not be more than 100 meters.

SEIAA, Bihar

5) Identifying the mining and no mining zone shall follow with defining the area of sensitivity by ascertaining the distance of the mining area from the protected area, forest, bridges, important structures, habitation, other vital infrastructures, etc. and based on the sensitivity the area needs to be defined in sensitive and non-sensitive area.

6) Demand and supply of the Riverbed Material through market survey needs to be carried out. In addition to this future demand for the next 5 years also needs to be considered, to justify the number and area of the sand ghats.

7) Mining area may be so selected as to cover the entire deposition area. Dividing a large area of deposition/aggradation into smaller mining leases should be avoided as it leads to loss of mineral and indirectly promotes illegal mining.

8) The DSRs should be placed in the public domain for at least one month from the date of publication of the advertisement for obtaining comments of the general public. The comments so received shall be placed before the sub-divisional committee for active consideration. Only after such consultation of the DSR should be submitted before the SEAC.

9) In the DSRs though the broader process of sand coming into rivers, the process of calculation of mineral potential, formula applicable, etc. has been described but there is no actual calculation for individual ghats in DSRs.

10) The provision is to maintain a buffer distance of 50 m after every 1000 m has not been mentioned in the maps provided in the DSR.

11) The Committee observed that sand ghats have been proposed on the confluence/meanders/concavities/active Channels which require to be excluded from the DSR. No mining area should be proposed at any bank concavities to avoid bank erosion and river stability.

12) The Committee was not shown any such map where 1/4th part of the area has been separated from central 3/4th part of the river as a minable and non-minable zone.

13) This provision is a part of EMGSM-2020 (at page 55) in its para 9.4 (11) There is no provision made about traffic concern of mineral transportation in the "DSR" however in EMGSM-2020 at para 4.1 (u), avoiding habitation, selection of mining route & their verification, etc. by State Government is mentioned. Thus, the question raised about traffic management is actually not an infraction of DSR -guidelines. Inclusion of "Traffic Management" for all the ghats of a district in DSRs shall make them cumbersome, therefore, this

has to be controlled on ease to case basis or sand-ghat-wise basis based on general principle, provided in the guidelines prior to starting of actual mining. This is presently being done through EMP, however, on the spot at congestion points the district administration may take care of the plan once approved.

14) Proposed Sand Ghats to include the certificate from the concerned Depn. on Forest Land distance from Wildlife Protected Areas (WPA).

15) If the proposed mining area has overlapping areas with previously allotted existing lease or already working or worked out mining lease then the same should be clearly depicted in the proposed mining area with different colour. Details about the quantity of Sand extracted from the overlapped area should be furnished duly certified from the concerned Department.

16) For these DSRs, which is not supported by Replenishment study, the depth of mining should not be done beyond 01 meter depth till such study is conducted through any recognized institute or agency. Each mining area should be developed and checked for the sediment rating curve for the potential sites against the extracted volumes of sand and gravel. Include the bed material and bed material load before, during and after the extraction period. Using the historical or gauged flow rating curve, determine the suitable period of high flow that can replenish the extracted volume. Calculate the extraction volume based on the sediment rating curve and high flow period after determining the allowable mining depth.

17) What's the reason behind proposing the depth of mining only 03 meters? In almost all the districts, the proposed depth of mining is 03 meters, which is practically not possible, this makes the calculations doubtful.

18) In rainfed rivers (dry rivers), what is your plan to maintain the depth of river bed (maintain morphology) to avoid drowning of animals and people. There is mention in the DSR in case of rainfed river [seasonal river about the plan to maintain the depth of such river bed (maintain morphology and to avoid drowning of animals and people)].

19) The reason behind selecting only 04 points as boundary of each sand mining site is not justified.

20) Provide average length and width of river and all the proposed sand ghats not provided. To check the proportion of the total river length/area taken up for sand mining in the light of the provision that only 60% of the river area should be allowed for sand mining in a district.

SEIAA. Bihar

21) Provide different colour map for proposed and existing sand mining area and also submit State, District Wildlife Sanctuary, Eco-Sensitive Zone boundary in different colour map and KML file to check the suitability of the mining site.

22) To show only a maximum of 60% mining area for removal of minerals in each identified sand ghat depicted in the Map/KML for each sand ghat.

23) Submit a map and KML file regarding aquatic animal found in river.

24) No mining area proposed within 10 km radius from urban area/city especially Gaya, Patna and Muzaffarpur.

25) Calculate the Minable Mineral potential for each sand ghat in the prescribed format (SSMG 2016, as prescribed in page no. 25 and 26).

26) The list of brick-kilns/stone boulder mineral should not be include in the DSR.

27) In the revenue generated detail for the past 03 years through sand mining, mention the revenue generated only through sand mining. It should be for each mine area with respect to sand mining done. [Ghats wise details of quantity of sand extracted and revenue generated (annually) for the past three years]. Only Sand mining revenue should be included in DSR not brick kiln/other minerals revenue.

28) All the Annexures as prescribed in the EMGSM 2020 should be duly filled and complete.

29) In almost all the DSRs the specific gravity of the sand is mentioned as 1.8, otherwise this figure changes with the size and weight of the sand particles over the length of the river system. This figure should be as [per arrived following the procedure laid down in EMGSM -2020 [Page No 17 (E) & 28(5.2)]

30). Wherever the location of sand ghats in close proximities, cluster formation should be done, as per the prescribed guidelines, in the prescribed format. For each cluster, one common Environmental Clearance should be obtained as prescribed.

31) The DSR should not disclaim the data provided through "Disclaimer" clause, as has been observed in four district DSRs.

32) The DSR should justify through figures and map, to prove that only maximum 60% of the total river area in the district is subjected to sand mining (including both the existing and proposed sand ghats).

33) All The District Should Display A Board of WLS Near (10km) the Sand Mining Area.

SEIAA, Bihar

34) All the District should put N (north) symbol on the map/ images of propo sed sand mining ghats.

35) Old and new proposed Ghats must be mentioned in all the DSR.(List ,Map & KML file).

36) District Border line (Bold mark) should be mentioned in the maps/images/KML file in all DSR.

37) All the primary and secondary data should be supported by proper references and documentary support.

38) FMISC (Flood Management Improvement Support Center), a R&D unit under WRD (Water Resource Department) at Anishabad, has high resolution satellite maps of river systems of Bihar. These comprise of recent as well as of past years. District Authorities may contact the office of FMISC for procurement of geo-referenced maps of the river to support the DSR.

District Survey Report for Aurangabad District (E-mail dated: - 22.12.2021 and Hard Copy Received date: - 22.12.2021)

S. NO	SEAC Observation	Compliance
I	The presentation of the Aurangabad district was good and the map of sand ghat (proposed and existing) was shown in the proper manner. However, DSR needs to require more improvement as per the guidelines.	District Survey Report is prepared as per Enforcement & Monitoring Guidelines for Sand Mining (EMGSM) January 2020, Issued by Ministry of Environment, Forest and Climate Change (MoEF & CC) guideline.
II	Average length and width of river and all the proposed sand ghats not provided. To check the proportion of the total river length/area taken up for sand mining in the light of the provision that only 60 % of the river area should be allowed for sand mining in a District.	Average length and width of the river has already been provided in the draft DSR. (Page No 63-64). 60% of the river area will be provided for sand mining in a District. (Calculation is shown in page no. 63-64 of DSR). 1/8th part of width of river is kept has no mining zone from both the bank of river.
III	Clear and high resolution color images of the proposed ghats should be submitted with DSR including the date of photographs/ GPS location for identification of potential sand mining area.	Potential sand mining area is attached with DSR (Page No 63-64). The sand ghats are falling within the part of Potential sand mining area. The photographs with date and G.P.S location is attached as Annexure III & Plates.
IV	Why so much sand mining from small tributaries, if demand is fulfilled. This has to be justified.	In the DSR, the sand Potential zone is identified and accordingly the sand ghat has been demarcated as per EMGSM -2020 sand mining guidelines. After that the mining department will auction the required sand ghats as per demand of the market.

Resolution of the Committee: -

Sl. NO.	SEAC Observation	Compliance
1	Justify the reasons for locating each sand mining ghat.	Sand potential zone has been identified in the DSR on the basis of rules, restriction, approach road, demand & supply.
2	Many Districts are already having a large number of existing mining ghat. Their detailed analysis of ground level, area demarcation, aggradation, and degradation, depth of mining, side slopes, width and cross sections should be presented to the committee.	Complied with. Field validation has already been done. All the point has been considered during mine plan preparation and its approval.
3	The specific gravity of the material also needs to be ascertained by analyzing the sample from a NABL accredited lab.	Complied. Sp. Gravity data of sand from NABL lab is attached as Annexure V .
4	The permanent boundary pillars need to be erected after identification of an area of aggradation and deposition outside the bank of the at a safe location for future surveying. The distance between boundary pillar on each side of the bank shall not be more than 100 meters.	It will be complied after auction by the department and preparation of the mine plan.
5	Identifying the mining and no mining zone shall follow with defining the area of sensitivity by ascertaining the distance of the mining area from the protected area, forest, bridges, important structures, habitation, other vital infrastructures, etc. and based on the sensitivity the area needs to be defined in sensitive and non-sensitive area.	The distance of sand ghats from the all-sensitive location is considered as per EMGSM -2020 guidelines. So. the proposed sand ghats are falling in Non – Sensitive area.
6	Demand and supply of the Riverbed Material through market survey needs to be carried out. In addition to this future demand for the next 5 years also	Only proposing sand ghats in the potential zone in the DSR. As the mining department has data of production dispatched of last 5 to 10 years, during

7	Mining area may be so selected as to cover the entire deposition area' Dividing a large area of deposition/aggradation into smaller mining leases should be avoided as it leads to loss of mineral and indirectly promotes illegal mining.	Complied with.
8	The DSRs should be placed in the public domain for at least one month from the date of publication of the advertisement for obtaining comments of the general public. The comments so received shall be placed before the sub-divisional committee for active consideration. Only after such consultation of the DSR should be submitted before the SEAC'	Complied with.
9	In the DSRs though the broader process of sand coming into rivers, the process of calculation of mineral potential, formula applicable, etc. has been described but there is no actual calculation for individual ghats in DSRs'	Complied with. Calculation for individual ghats is attached as Table no 7.5. Page No 46 of DSR.
10	The provision is to maintain a buffer distance of 50 m after every 1000 m has not been mentioned in the maps provided in the DSR'	Complied with. Please refer to Plates.
11	The committee observed that sand ghats have been proposed on the confluence/meanders/concavities/active channels which require to be excluded from the DSR. No mining area should be proposed at any bank concavities to avoid bank erosion and river stability'	Complied with. Please refer to Plates
12	The Committee was not shown any such map where 1/4th part of the area has been separated from central 3/4th part	Complied with. Please refer to Plates.

13	This provision is a part of EMGSM - 2020 (at page 55) in its Para 9.4 (11) There is no provision made about traffic concern of mineral transportation in the "DSR" however in EMGSM-2020 at Para 4.1(n), avoiding habitation, selection of mining route & their verification, etc. by State Government is mentioned. Thus, the question raised about traffic management is actually not an infraction of DSR –guidelines. Inclusion of "Traffic Management" for all the ghats of a district in DSRs shall make them cumbersome, therefore, this has to be controlled on case to case basis or sand-ghat-wise basis based on general principle, provided in the gudelines prior to starting of actual mining. This is presently being done through EMP; however, on the spot at congestion points the district administration may take care of the plan once approved.	Complied with. Please refer Annexure XIII.
14	Proposed Sand Ghats to include the certificate from the concerned Deptt. On Forest Land distance from Wildlife Protected Areas (WPA).	Complied with. Please refer Annexure VI .
15	If the proposed mining area has overlapping areas with previously allotted existing lease or already working or worked out mining lease then the same should be clearly depicted in the proposed mining area with different colour. We are propnsing 1m to 2m depth in the rainfed rivers for the mining which will not disturb any animals in that area.

1. Preface

The present District Survey Report is prepared in compliance of interim order passed by the Hon'ble Supreme Court on 10-11-21 in the case of Civil Appeal No. 3661-3662/2020, State of Bihar & Others vs. Pawan Kumar & Others. The District Collector through its letter dated 16-11-2021 had constituted the sub-divisional committee to prepare the District Survey Report.

The need for District Survey Report (DSR) have been necessitated by Ministry of Environment, Forest and Climate Change (MoEF & CC) vide their Notification No. 125 (Extraordinary, Part II Section 3, Sub-section ii), S.O. 141 (E), dated 15th January 2016.The notification was addressed to bring certain amendments with respect to the EIA notification 2006 and in order to have a better control over the legislation. District level committees have been introduced in the system. As a part of this notification, preparation of District Survey Reports has been introduced. Subsequently, Ministry of Environment, Forest and Climate Change has published Notification No. 3611 (E), dt. 25th July, 2018 regarding inclusion of the "Minerals Other than Sand" and format for preparation of the DSR has been specified. Enforcement &Monitoring Guidelines for Sand Mining (EMGSM) January 2020, Issued by Ministry of Environment, Forest and Climate Change is prepared in consideration of various orders/directions issued by Hon'ble NGT in matters pertaining to illegal sand mining and also based on the reports submitted by expert committees and investigation teams. This DSR has been prepared in conformity with the S O 141 (E), S O 3611 (E) and other sand mining guidelines published by MOEF & CC time to time as well as the requirement specified in Bihar Minerals (Concession, Prevention of Illegal Mining, Transportation and Storage) Rules, 2019.

The purpose of DSR is to identify the mineral potential areas where mining can be allowed. The DSR of Aurangabad District also describes the general geographical profile of the district, distribution of natural resources, livelihood, climatic condition and sources of revenue generation.

SEIAA, Bihar

2. Introduction

The District Survey Report of Aurangabad District has been prepared in compliance of interim order passed by the Hon'ble Supreme Court on 10-11-21 in the case of Civil Appeal No. 3661-3662/2020, State of Bihar & Others vs. Pawan Kumar &Others. and as per the guide line of Ministry of Environment, Forests & Climate Change (MoEF & CC), Government of India vide Notification S.O.-1533(E) dated 14th Sept, 2006 and subsequent MoEF & CC Notification S.O. 141(E) dated 15th Jan, 2016. This report shall guide systematic and scientific utilization of natural resources, so that present and future generation may be benefitted at large. Further, MoEF & CC published a notification S.O. 3611(E) Dated 25th July, 2018 and recommended the format for District Survey Report.

The main objective of DSR is to identify the areas of aggradations or deposition where mining can be allowed; and identification of areas of erosion and proximity to infrastructural structures and installations where mining should be prohibited and estimation of annual rate of replenishment and allowing time for replenishment after mining in that area. The DSR would also help to calculate the annual rate of replenishment wherever applicable and allow time for replenishment. Besides the sand mining, the DSR also include the potential development scope of in-situ minor minerals.

The objectives of the District Survey Report are as following:

1. Identification and Quantification of Mineral Resource and its optimal utilization.
2. To regulate the Sand Mining in the district Aurangabad, identification of site-specific end-use consumers and reduction in demand & supply gaps.
3. Use of information technology (IT) & latest scientific method of mining for surveillance of the sand mining at each step.
4. District Survey report shall enable Environmental Clearance for cluster of Sand Mines. It shall assist concern Department during post Environmental Clearance Monitoring.
5. To control the instance of illegal mining.
6. To control the flood in the area.
7. To maintain the livelihood of aquatic habitat.
8. To protect the incursion of ground water in the area. Limiting extraction of material in floodplains to an elevation above the water table generally disturbs more surface area than allowing extraction of material below the water table.
9. To keep accumulated data records viz. details of Mineral Resource, potential area, lease, approved mining plan, co-ordinates of a district at one place.

10. To maintain the records of revenue generation.
11. Excavating sand from a small straight channel with a narrow floodplain generally will have a greater impact on the natural hydrologic processes than excavations on a braided channel with a wide floodplain.
12. Extracting sand from a large river or stream will generally create less impact than extracting the same amount of material from a smaller river or stream.
13. A concise guide line can be framed considering the point discussed in the DSR for sand mining in the district.

The District Survey report (DSR) is comprised of secondary data published and endorsed by various departments and websites about geology of the area, mineral resources, climate, topography, land form, forest, rivers, soil, agriculture, road, transportation, irrigation etc. Data on lease and mining activities in the district, revenue etc. is collected and collated from concern district Head Quarter.

The District Collector though its letter dated 16-11-2021 had constituted the sub-divisional committee to prepare the District Survey Report. List of the members of the sub-divisional Committee is shown below:

State of Haryana and Others etc., ordered that "leases of minor minerals including their renewal for an area of less than five hectares be granted by the States/Union Territories only after getting environmental clearance from MoEF"; and Hon'ble National Green Tribunal, order dated the 13th January, 2015 in the matter regarding sand mining has directed for making a policy on environmental clearance for mining leases in cluster for minor Minerals.
2016	The MoEF & CC in compliance of above Hon'ble Supreme Court's and NGT'S order has prepared "Sustainable Sand Mining Guidelines (SSMG), 2016" in consultation with State governments, detailing the provisions on environmental clearance (EC) for cluster, creation of District Environment Impact Assessment Authority, preparation of District survey report and proper monitoring of minor mineral. There by issued Notification dated 15.01.2016 for making certain amendments in the EIA Notification, 2006, and made mandatory to obtain EC for all minor minerals. Provisions have been made for the preparation of District survey report (DSR) of River bed mining and other minor

	minerals.
2018	MoEF & CC published a notification S.O. 3611(E) Dated 25th July, 2018 and recommended the format for District Survey Report. The notification stated about the objective of DSR i.e. "Identification of areas of aggradations or deposition where mining can be allowed; and identification of areas of erosion and proximity to infrastructural structures and installations where mining should be prohibited and calculation of annual rate of replenishment and allowing time for replenishment after mining in that area".
2019	The main objective of Sand Mining Policy, 2019 to ensure that sand mining is done in an environmentally sustainable manner, to ensure availability of adequate quantity of sand, to increase the number of settles to ensure generation of employment.
2020	Enforcement & Monitoring Guidelines for Sand Mining (EMGSM) 2020 has been published modifying Sustainable sand Mining Guidelines, 2016 by MoEF & CC for effective enforcement of regulatory provisions and their monitoring. The EMGSM 2020 directed the states to carry out river audits, put detailed survey reports of all mining areas online and in the public domain, conduct replenishment studies of river beds, constantly monitor mining with drones, aerial surveys, ground surveys and set up dedicated task forces at district levels. The guidelines also push for online sales and purchase of sand and other riverbed materials to make the process transparent. They propose night surveillance of mining activity through night-vision drones.
2021	Bihar Minerals (Concession, Prevention of Illegal Mining, Transportation and Storage) Rules, 2021. The notification stated about the prevention of illegal mining, transportation and storage of sand and guidelines for mining activity, safety barriers, mining depth and lease.

2.2 Methodology of DSR Preparation

The data related to district profile, geology, mineralization, and mining activity are sketchy and disjointed. There are multiple data sources, which are in the public domain, as well as in Government website. To prepare District Survey Report, need to collate all the available databases on these iron regards. A comprehensive and a meaningful interpretable database created, which would be necessary to demonstrate the district overview. Workflow for the DSR job is as follows.

2.2.1 Data source Identification: District Survey Report has been prepared based on the Primary data base and secondary data base collated from different sources. This is very critical to identify authentic data sources before collating the data set. The secondary data sources which are used in DSR are mostly Government published data based or the published report in reputed journal. District profile has been prepared based on the District Statistical handbook published by Bihar Government as well as District Census 2011. Potential mineral resources have been described based on GSI or any other govt. agencies work done. Mining lease details and the revenue generated from minor minerals has been prepared based on available data from DL&LRO offices of the district. Satellite image has been used for map preparation related to physiography and land utilization pattern of the district.

2.2.2 Data Analysis and Map preparation: Dataset which are captured during the report preparation, are gone through detail analysis work. District Survey Report involves the analytical implication of captured dataset to prepare relevant maps. Methodology adopted for preparation of relevant maps is explained below.

Land Use and Land Cover Map: Land Use and Land Cover classification is a complex process and requires consideration of many factors. The major steps of image classification may include determination of a suitable classification system via Visual Image Interpretation, selection of training samples, Satellite image (FCC-False Colour Composition) pre-processing, selection of suitable classification approaches, post-classification processing, and accuracy assessment.

Here LISS-III satellite Imagery has been taken for Supervised Classification as supervised classification can be much more accurate than unsupervised classification, but depends heavily on the training sites, the skill of the individual processing the image, and the spectral distinctness of the classes in broader scale.

According to the Visual Image Interpretation (Tone, Texture, Colour etc.) training set of the pixel has been taken.

	
Agricultural Land - Based on their Geometrical shape, Red and Pink colour tone, Agricultural Land has been identified.	**Vegetation Covered Area** - Based on their continuous Red colour tone, Vegetation Covered Area has been identified.
	
Agricultural Fallow Land - Based on their Geometrical shape, Light and dark cyan with light pink colour tone, Agricultural Land has been identified.	**Bad Land Topography**- Light Yellowish mixed with cyan colour has been identified as Bad Land Topography.
	
Settlement – Area with Cyan Colour including geometrical shape has been recognised as Settlement Area.	**Water Bodies** – Dark blue colour has been classified as Water Bodies.

Figure No.2.1: Pictorial description of Land Use Classificatim methods

Geomorphological Map:

The major steps of preparing Geomorphological Map is identifying features like Alluvial Fan, Alluvial Plain, Hilly Region etc. from Satellite Imagery (FCC-

False Colour Composition) via Visual Image Interpretation and then digitization has been taken into the consideration to prepare map including all the Geomorphological features according to their location.

	
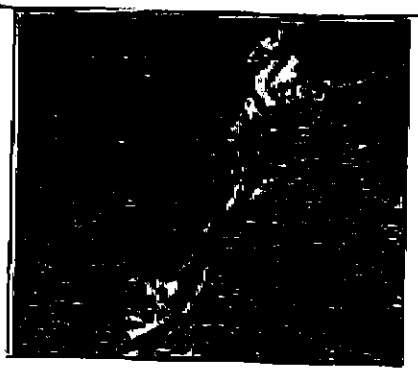

Alluvial Plain- In satellite Imagery the flat land has been identified as Alluvial Plain just below the Alluvial Fan.	**Alluvial Fan** – A fan-based deposition formed by stream where the velocity is abruptly decreased. In satellite Imagery this has been identified just below the hilly region.

Final layout has been prepared by giving scale, legend, north arrow, etc.

2.2.3 Primary Data Collection: To prepare DSR, capturing primary data or field data has also been carried out in the district. Field study involves assessment of the mineral resources of the district by means of pitting / trenching in specific interval. This provides clear picture of mineral matters characterization and their distribution over the area.

2.2.4 Replenishment study: One of the principal causes of environmental impacts from in-stream mining is the removal of more sediment than the system can replenish. It is therefore need for replenishment study for river bed sand in order to nullify the adverse impacts arising due to excess sand extraction. The annual rate of

replenishment carried out on every river of the district to have proper assessment of the sand reserve for mining purposes.

Physical survey has been carried out by GPS/DGPS/Total Station to define the topography, contours and offsets of the riverbed. The surveys clearly depict the important attributes of the stretch of the river and its nearby important civil and other feature of importance. This information will provide the eligible spatial area for mining.

2.2.5 Report Preparation: District Survey Report has been prepared to fulfill the purpose of identification of potential mineralized zones with respect to Minor Mineral including River Sand (Other than Stowing Purpose), their mineability and environmental impacts. Report provides details of the major and mineral potential zones. Assessing mining prospect with respect to minor minerals. Replenishment study details includes in the report. Report also provides the socio environmental study for establishing minor minerals in the district.

2.3 Demand and Supply of Sand

Sand is a multi-purpose topographical material. It is known as one of the three fundamental ingredients in concrete. The composition of sand is diverse.

The robustness of sand has played a significant role in everyday life. We use sand practically every other day.

Sand is a multi-purpose topographical material. It is known as one of the three fundamental ingredients in concrete. The composition of sand is diverse.

The robustness of sand has played a significant role in everyday life. We use sand practically every other day.

Sand extraction from river beds are the main mining activities in the district. With a spurt in construction of real estate sectors and various govt. sponsored projects, the demand for sand has increased manifold.

In the real world, there are a lot of situations where we can find uses/demand of sand. Followings are the common sand uses.

1. While bunging metal, we can mix sand with clay binder for frameworks used in the foundries.
2. Sand can be used for cleaning up oil leak or any spill by dredging sand on that spill. The material will form clumps by soaking up, and we can quickly clean the mess.
3. Sand can be used as a road base which is a protective layer underneath all roads
4. Industrial sand is used to make glass, as foundry sand and as abrasive sand.

5. One creative usage of sand is serving as a candle holder. We can try putting some sand before pouring tea light or any candle in a glass. It holds the candle still and refrain the candle from rolling by giving it an excellent decoration.
6. Adds texture and aesthetic appeal to space.
7. Sand is mostly pure to handle, promptly available and economically wise.
8. We use sand in aquariums, fabricating artificial fringing reefs, and in human-made beaches
9. Sandy soils are ideal for growing crops, fruits and vegetables like watermelon, peaches, peanuts, etc.
10. Sand can light a path by filling mason jars with sand and tea light which is another inexpensive way to make a walkway glow.
11. Sand helps to improve resistance (and thus traffic safety) in icy or snowy conditions.
12. We need sand in the beaches where tides, storms or any form of preconceived changes to the shoreline crumble the first sand.
13. Sand containing silica is used for making glass in the automobile and food industry- even household products for the kitchen.
14. Sand is a strong strand which is used for plaster, mortar, concrete, and asphalt.

Sand extracted from Aurangabad district is used extensively in construction works ranging from individuals to organized corporate and government sectors.

b)Climate Condition

A warm and humid climate embraces the area. The summer (March–June) is hot with mean maximum temperature during June (peak summer) as 36.6°C. A dry and cold winter (October to February) records mean minimum temperature as 9.2°C in January. Humidity varies from 24.7% to 83.45%. The districts fall in the South Agro-Climatic Zones of Bihar and the annual rainfall in this area varies within 990-1300 mm. 88% of this rainfall comes during the southwest monsoon (June to September).

c) Demography

According to the 2011 census Aurangabad district, Bihar has a population of 2,540,073. This gives it a ranking of 172nd in India (out of a total of 640). The district has a population density of 760 inhabitants per square kilometre (2,000/sq mi). Its population growth rate over the decade 2001–2011 was 24.75%. Aurangabad has a sex ratio of 916 females for every 1000 males and a literacy rate of 72.77%.

d) Cropping pattern

The people of the district depend on agriculture for their livelihood and sustenance. Rice and wheat are the staple crops. Besides, mustard, vegetables and dal are richly cultivated, specifically in the southern parts of the district. The northwestern parts of the district covering the blocks such as Barun, Obra, Daudnagar, Goh and Haspura get East Sone Canal water for irrigation. Though,

there is a culture of triple harvesting a year in the district, in many parts people fail to achieve this due to lack of irrigation facilities.

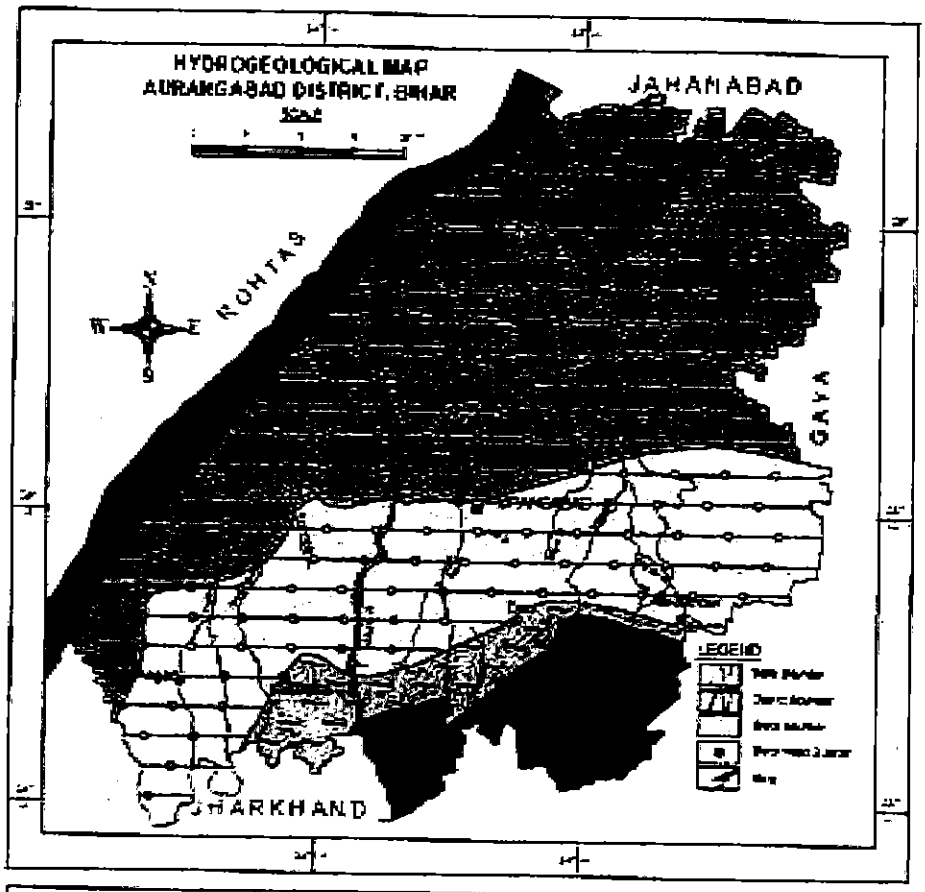

e) Topography & Terrain

The District can be divided into two regions namely hard core rock region and Jalodhak region. The district consists of flat alluvial plain. The northern portion of the district is mostly a plain formed an alluvial soil and is extremely fertile. In a few portion of Aurangabad, fertile alluvium is found. This is locally known as Kewal and is very suitable for paddy, wheat and sugar-cane. In the southwestern part of this district, below the hills, sandy loam is found. The only important and principal river of the district is the Sone which rises near the sources of Narbada and Mahanadi in the elevated plateau of Central India near Maikal Hills. It traverses a course of 520 kilometers through a hilly tract until it enters the gangetic valley opposite Akbarpur in Rohtas district. It then passes Barun and Daudnagar and then leaves the district. The Sone receives no tributary of any importance from the point where it enters the district until it joins the Ganges. The river, as a matter of fact, does not enter the district and after passing Barun and Daudanagar, leaves the district. At Barun there is a massive masonry dam on the river Sone.

f) Hydrogeology

Unconsolidated Quaternary Alluvium, weathered zone and consolidated (fissured) formation-Granite gneiss form three hydrogeological units in the district. About 95% of the geographical area of the Aurangabad district is covered with Quaternary Gangetic alluvial deposits. The groundwater occurs under unconfined conditions in the shallow aquifer whereas in the deeper aquifers it occurs under confined conditions. The shallow tube wells in the depth range of 30-50 m are capable of yielding 15-20 m3 /hr discharges, whereas, the deeper aquifers are capable of yielding 50-100 m3 /hr.

FORMATION	LITHOLOGY	THICKNESS	GROUND WATER POTENTIAL
Unconsolidated	Alluvium	Thickness varies from 50 - 120m	Yield vary from 100 - 200 cu m/hr
	Marginal Alluvium	Thickness varies from 30 - 50m	Yield vary from 50- 100 cu m/hr
Consolidated	Weathered zone	Thickness varies from 10 - 15 m	Yield vary from 60 m cu m/day
	Granitic gneiss	Fractured and joint	Fractured and joint

Figure No. 3.3: Hydrogeological map of Aurangabad district

The thickness of the weathered zone ranges from 5 m to 30 m. Ground water occurs under unconfined condition within the weathered mantle. Joints, cracks, fractures and other types of secondary porosity control the occurrence and movement of groundwater. The discharge and yield of the wells varies from place to place due to inhomogeneity of the fractures. The results of the exploratory drilling carried out by the Central Ground Water Board at Deo in the hard rock area indicate presence of 2 to 3 sets of productive fractures down to a depth of 135 m (33-35 m, 68-70 m & 79-80 m depth ranges). The yield from the wells varied between 30-40 m3 /hr. The transmissivity of the fracture zones varied between 16-28.5 m2 /day, whereas, the storability was estimated at 0.0111 indicating unconfined character of the aquifer.

The hydrogeological transects indicate the existence of prolific aquifers in the northern and northwestern parts of the district thick deposits of sand of size varying between fine to coarse in the areas. The lithology becomes more clayey towards south. The central and southwestern parts of the district are clayey in character with infrequent minor sand zones. The Sone River has played an important role in building the stratigraphic succession in the Aurangabad district.

g) Ground Water Development:

CGWB has established a network of observation wells under National Hydrograph Network (HNS) programme to ascertain fluctuation and quality of groundwater in the district. There are 10 HNS monitoring locations which are being monitored every year regularly during January, May, August and November. In addition, a total of 6 piezometers are being monitored in Aurangabad Urban area to account for the behavior of the deeper aquifers which are under intensive development for urban water supply of Aurangabad.

The pre-monsoon depth to water level (DTW) map depicts the variation of water level within the range of <1.0 and 12.23 m below ground level (m bgl). The deeper water level >8 m bgl are observed in the areas close to Sone River and at the down reaches of Punpun River at the western and northeastern parts respectively, whereas the shallow water levels<6m are observed at the northern and southern of the district. The post-monsoon depth to water level records auto flow-wells at the southwestern corner of the district with piezometric level resting at a maximum of 1.50 m above ground level. Seasonal water level fluctuation (rise in water level) remains within 0.84-5.93 m.

Aurangabad district possesses a total of 91046 .ham as the annual replenishable groundwater resource (As on 31st March 2009). The average stage of groundwater development is only 23.2 % (Table No 3.3). Though, the groundwater level in majority blocks register declining trend, it is still not alarming and significant. As such, all the blocks in the district are safe from groundwater development point of view and thus the district possesses a huge potential for developing the resource.

h) Drainage System

The Aurangabad district falls in the Punpun River Sub-basin. Major rivers of the district are the Sone, Punpun, Batane, Madar and Aadri River in Aurangabad District. The Sone flows in north eastern direction in a NE-SW trend. Punpun flows in north eastern direction in a NE-SW trend. Madar, Aadri and Batane River flows in north direction in a N-S trend.

- **Floods in district Aurangabad:**

Bihar on account of its location coupled with ***hydrometeorology, hydrology, geomorphology and topography*** is one of the worst flood affected region in the world. It lies in the tropical to sub-tropical region and has a monsoon climate with an average annual rainfall of 1106 mm.

Distribution of the vulnerable and less vulnerable flood prone districts are shown in the below figure no. 3.5.

SEIAA, Bihar

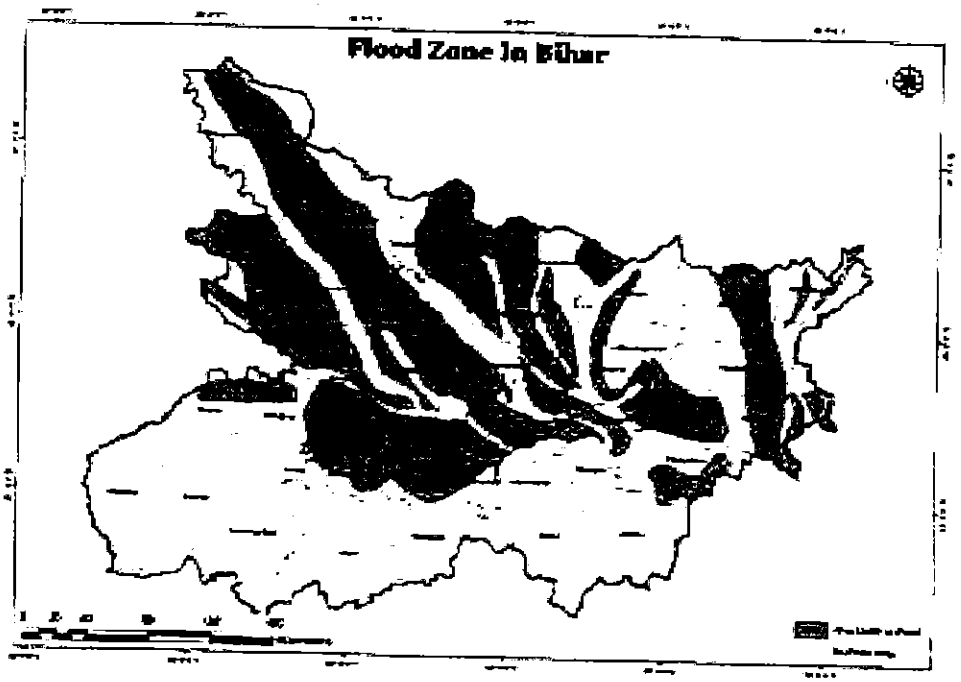

Figure No. 3.5A: Flood Prone districts of Bihar.

From the above information, it is being observed that. Aurangabad is non- flood prone district of Bihar.

i) Seismicity

As per Seismicity Zonation map, 3 types of Zones have been observed in Bihar. Aurangabad comes under India's seismic zone-IV, indicating its vulnerability to major earthquakes and also witnessed the earthquake in the year 2015.

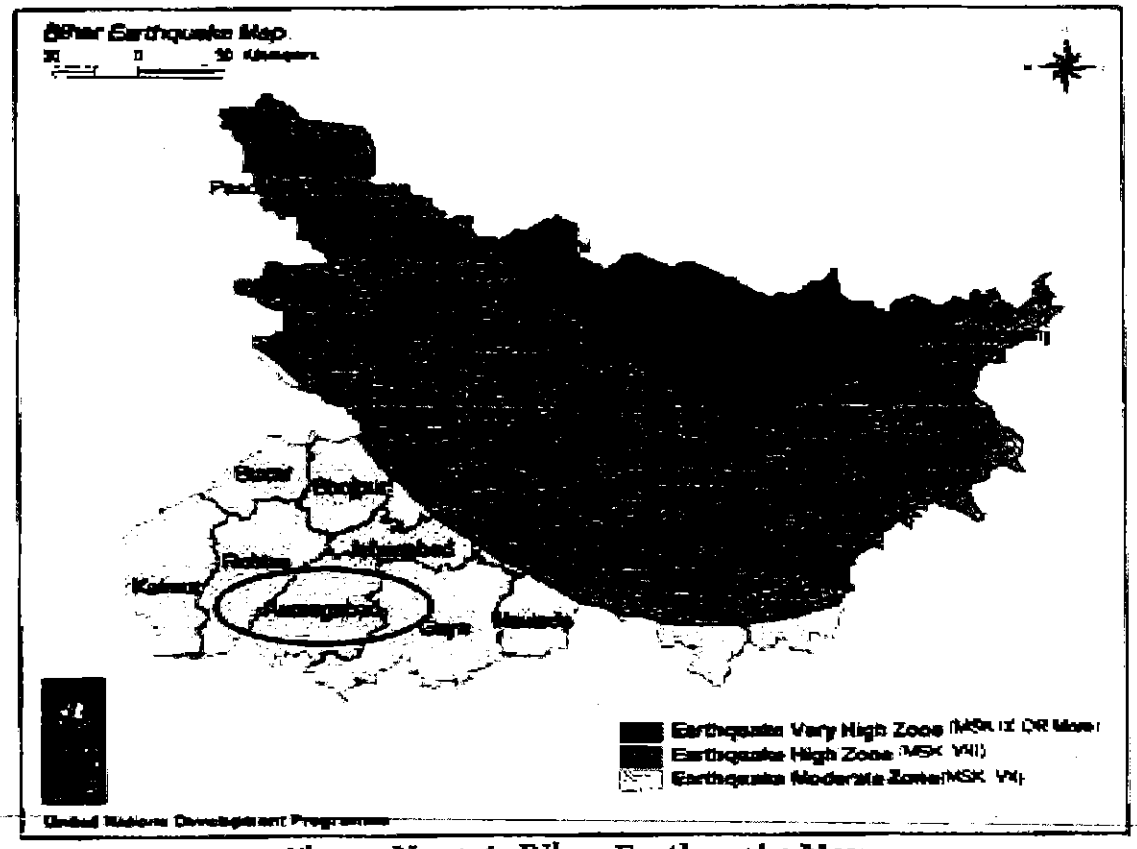

Figure No. 3.6: Bihar Earthquake Map

j) Flora

The Indian state of Bihar contains sub-Himalayan foothills and mountains with moist deciduous forests. Rainfall may exceed 1106 millimeters per year. Neem, Sisam, Yellow Kanel, Ashoka, Sagwan, Bel, Jungle jalebi, Gulmohar, Mango, Guava etc.

k) Fauna

Nine species of Anuran amphibian belonging to four families and eight genera were found to occur in Aurangabad Bihar. The habitat preference of these amphibians are of wide range like in and around the natural and artificial water bodies, human residential area, forested areas, termite nest, tree hole, under spaces of logs, leaf litter and so on. Of the nine Anuran amphibian identified 5 species were found in and around the Deo Suryakund (site-I), all the 9 species were found and identified in and around the area of Raja Jagganath dam Deo

(site-II), and 7 species were identified in and around the Unga pond (site-III) of Aurangabad Bihar.

4. Physiography of the district

a) General Landforms

The southern hilly ranges and the northern Gangetic Plains form two physiographic units of the Aurangabad district. The southern hilly unit is undulating in character, occupied by high mountain ranges and low valleys covering parts of Kutumba, Nabinagar, Deo and Madanpur blocks. The constituting rocks of the hills dip northward and form the basement of the northern lying Gangetic Plain. At the transition parts from hard rock to alluvial plain, the hard rocks are exposed (lineacly) at places as inliers. The northern alluvial plain slopes NNE. The maximum elevation is attained to heights of 411.48 m above mean sea level by the hills located south of Deo. The minimum elevation of ~80 m amsl runs at the northeastern parts around Goh.

b) Soil and rock pattern

Three types of soil are mainly observed in the district:

a) Younger Alluvial soils,

b) Older Alluvial soils, and

c) Foot hill soils.

These soils have been formed as a narrow belt along the western periphery of the district following the Sone River. These are generally yellowish white to reddish yellow in colour, sandy to loamy sand in texture. Major parts of the district are occupied by the Older Alluvial soils.

Aurangabad district mainly having two geomorpholocal units, the southern hilly ranges and the northern Gangetic Plains.

5. Land use pattern of the district:

Agriculture is the main occupation of the people of the district and also the main source of lively hood of the people. Rainfall still controls the agricultural economy of Aurangabad district.

The land in the western portion of the district is fairly levelled and is mostly under cultivation. It has the benefit of canal irrigation and hence it is considered to be a fertile tract. The greater part of the district was once the basin of the Sone river itself and the soil being largely composed of old alluvial deposit is naturally more productive than elsewhere.

The principal crops grown in the district are rice (Bhadai and Aghani) and wheat. The system of pynes and ahors is not in a good shape, as it happened be earlier, and the agriculture has been, to a great extent left at the mercy of the vagaries of monsoon.

Table No. 5.1: Land Use details of Aurangabad Districts

Sl. No.	Land Use	Aurangabad Area (in Ha)
1	Forest	4.71
2	Net Sown area	173.71
3	Fallow land	72.73
4	Not suitable land for cultivation	1.94
5	Other land	67.3

a) Forest detail of the area

The forests in Aurangabad Forest Division correspond to the 'Tropical Dry Deciduous Forests' as per Champion and Seth's classification of forests. Within this type, local variations are met with, due to variations in nature of soil and topography. Better stocked patches occur in cooler and protected areas on the south-west corner of the district adjoining the forests of Gaya Forest Division and Daltonganj Forest Division of Jharkhand State. But these patches are also under heavy biotic pressure.

b) Agriculture& Irrigation

The major crops of kharip season are – Cotton, Bajra & Corn and that of rabbi season are – Jawar, Wheat & Gram. Total area under cultivation is 8.52 lakhs hectares and net sown area is 7.15 lakhs hectares.

Jaikwadi is the major irrigation project in the district. There are 15 medium irrigation projects. They cover 37 thousand hectares command area. The 106 minor irrigation projects in the district cover 45 thousand

hectares command area. There are 68928 irrigation wells and they cover 122.18 thousand hectares command area.

c) Horticulture

Aurangabad district is under Low Level of Production in Horticultural Crops - The low level of horticultural development has found in the district These districts come under the periphery areas where there is a great lack of infrastructure regarding horticultural crops. Floriculture in the district is not developing in the same fashion as compared to other crops. So, there is need to emphasis on these crops. Horticulture cultivation is always advantageous. It paves the ways and means of development. It has been observed that it could be developed in the state if the government provides protection and subsidies to the farmers. There is a great need to emphasis on marketing management and boosting the irrigation resource of the state along with that there is need of awareness on profitability and techno managerial skill among farmers to promote the horticultural cultivation in the state.

d) Mining

The mineral resources of Aurangabad district playing massive role in industrial, social and economic development of the district Available mineral resources in the district

- Sand
- Sandstones
- Quartzite

Especially Sand mining activities are playing a significant role industrial, social and economic development of the district. The sand mining carried out throughout the district mainly in stretch of Sone River.

There are two stone mining sites at Rafiganj and Madanpur block of the district.

6. Geology:

The Aurangabad district lies in the western part of Bihar and is bounded in the west by the Sone River, which also forms the main drainage system of the district. The district is well connected by a network of roads and railways, Aurangabad being the district headquarter.

Geologically the rocks belonging to Archaean, Proterozoic and Permian in age occupy the southern part of the area. The Quaternary sediment ranging in age from Pleistocene to Holocene covers rest of the area. The metamorphites of Chhotanagpur having in age ranging from Archaean to Lower Proterozoic are the oldest rock exposed within the district. It comprises sillimanite schist, biotite chlorite schist, quartz schist, mica schist, phyllite, quartzite, hornblende schist and amphibolite. The Chhotanagpur gneissic complex A represented by granite gneiss, ranges in age from Archaean(?) to Proterozoic. Intrusives like porphyritic granite, acid porphyry and gabbros belong to Proterozoic age. The area withheld a long gap in the geological history before sedimentation of sandstone and shale with coal seams of the Barakar Formation of Gondwana Supergroup during the Permian. Lately the area is covered by Quaternary alluvial deposits, classified into Hajipur = Mohanpur formation characterised by sticky sandy or silty clay impregnated with caliche, Vaishali = Bare formation represented by sandy to silty clay and Ramghar formation represented by sand and silt. A large extent of the area at the northern and western parts of the district is covered by highly fertile land. The southern hilly part of the district is characterised by thick vegetation. Silty clay available from riverbanks is suitable for construction of bricks, tiles and earthenware. The district is enriched with both surface and ground water which are suitable for both drinking and irrigation purpose. Natural hazards of the district include annual flood, water logging, riverbank erosion and earthquake. The area nearer to riverbank gets flooded every year in the rainy season and the depressed areas become inundated for considerable period. Bank erosion is a common feature particularly along the banks of rivers.

7.2 Details of Resources

A)Sand and other riverbed minerals:

I) Drainage System (Description of main rivers/streams, Salient features of important rivers and streams, list of villages, which the river pass through)

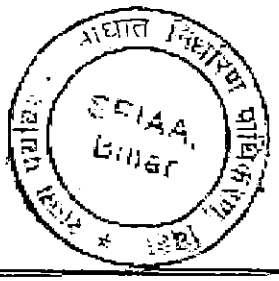

Sone, Punpun, Batane, Aadri and Madar are major sand producing rivers in Aurangabad district. Besides the river there are many ephemeral streams. Apart from these sources there are many Tals. During the process of shifting of course these rivers leave behind cut off, meanders, abandoned channels and a number of marshes locally known as chaurs. The chaurs are also responsible for water logging in the area with the onset of monsoon and contract to become localised during summer. Apart from this drainage system there is a very good network of canal system also in this district. Description of some major rivers of the district is described below.

River Sone: The Son originates near Amarkantak in Anuppur district of Madhya Pradesh. .

The Son River which is 784 kilometers long is one of the longest Indian rivers. Its chief tributaries are the Rihand and the North Koel. The Son has a steep gradient (35–55 cm per km) with quick run-off and ephemeral regimes, becoming a roaring river with the rain-waters in the catchment area but turning quickly into a fordable stream. The length of the sone in Aurangabad district is 72 km while the width of the river 2-4 km in the district.

River Punpun:

The Punpun River is a tributary of the Ganges. It originates in Palamu district of Jharkhand and,flowsthrough Chatra, Aurangabad. Gaya and Patna dist ricts of the Indian states of Jharkhand and Bihar. The Punpun originates on the Chhotanagpur Plateau, at an elevation of 300 metres. . The length of the Punpun in Aurangabad district is 120 km while the width of the river 1-2 km in the district. The river mostly flows in a north-east direction and joins the Ganges at Fatuha, 25 kilometers downstream of Patna. The main tributaries of the Punpun are – the Butane, the Madar and the Mohar.

ii) Annual deposition of riverbed minerals

Annual deposition of riverbed minerals is dependent on various factors which are explained below.

A. Geomorphological studies

Geomorphological characteristic of a river is foremost factor for annual deposition of sedimentary load. The study includes following parameter:

i) Place of Origin

Details of origin of rivers of Aurangabad District is furnished below.

Table No. 7.3: Place of Origin of important rivers and streams

Name of the River or Stream	Place of origin
Sone	Amarkantak Hill
Punpun	Palamu District of Jharkhand
Madar	Baligawan
Aadri	Kataia
Batane	Dulare

ii) Catchment Area

The catchment area of Son River demarcates the district boundary between Bhojpur and Patna in the central west Bihar and also district boundary between Bhojpur and Arwal. In south western Bihar it demarcates the district boundary between Aurangabad and Rohtas.

Watershed of Son includes mainly Patna and Bhojpur district and northern part of Aurangabad and Bhabua District.

The catchment area of Punpun River demarcates the central part of Arwal district, Aurangabad and western part of Patna district. Watershed of Punpun includes mainly Arwal and Aurangabad district as well as western part of Patna district.

The catchment and watershed area of Batane, Aadri and Madar rivers are restricted almost within Aurangabad district and also some part of other districts of Bihar.

iii) General profile of river stream

River profile has been studied along the cross-section lines which was chosen based on the drastic variation of the river widths, proximity of the operating sand Ghats and the position of the sand bars.

Relative disposition of rivers in Aurangabad district along with the distribution of the section lines are shown in figure 7.1.

iv) Annual deposition factor

Annual deposition of riverbed materials depends on various factors, such as process of deposition, mode of sediment transport, sediment transport rate, sedimentation yield of the river.

1. Process of deposition

Deposition is the processes where material being transported by a river is deposited. Deposition occurs when the forces responsible for sediment transportation are no longer sufficient to overcome the forces of gravity and friction, creating a resistance to motion; this is known as the null-point hypothesis. This can be when a river enters a shallow area or towards its mouth where it meets another body of water.

The principle underlying the null point theory is due to the gravitational force; finer sediments remain in the water column for longer durations allowing transportation outside the surf zone to deposit under calmer conditions. The gravitational effect or settling velocity determines the location of deposition for finer sediments, whereas a grain's internal angle of friction determines the deposition of larger grains on a shore profile.

Deposition of non-cohesive sediments: Large-grain sediments transported by either bedload or suspended load will come to rest when there is insufficient bed shear stress and fluid turbulence to keep the sediment moving; with the suspended load this can be some distance as the particles need to fall through the water column.

Deposition of cohesive sediments: The cohesion of sediment occurs with the small grain sizes associated with silts and clays, or particles smaller than 4Φ on the phi scale.If these fine particles remain dispersed in the water column, Stokes law applies to the settling velocity of the individual grains. The face of a clay platelet has a slight negative charge where the edge has a slight positive charge when two platelets come into close proximity with each other the face of one particle and the edge of the other are electrostatically attracted, and then have a higher combined mass which leads to quicker deposition through a higher fall velocity.

2. Mode of sediment transport in rivers

Sediment transport in rivers provides a dynamic linkage between flow and channel form. Mainly there are three processes by which sediment load is transported and these are rolling or traction, in which the particle moves along a sedimentary bed but is too heavy to be lifted from it; saltation; and suspension, in which particles remain permanently above the bed, sustained there by the turbulent flow of the water.

Another name for sediment transport is sediment load. The total load includes all particles moving as bedload, suspended load, and wash load.

Bed load: Bedload is the portion of sediment transport that rolls, slides or bounces along the bottom of a waterway. This sediment is not truly suspended, as it sustains intermittent contact with the streambed. and the movement is neither uniform nor continuous. Bedload occurs when the force of the water flow is strong enough to overcome the weight and cohesion of the sediment. While the particles are pushed along, they typically do not move as fast as the water around them, as the flow rate is not great enough to fully suspend them. Bedload transport can occur during low flows (smaller particles) or at high flows (for larger particles). Approximately 5-20% of total sediment transport is bedload. In situations where the flow rate is strong enough, some of the smaller bedload particles can be pushed up into the water column and become suspended.

Suspended load: While there is often overlap, the suspended load and suspended sediment are not the same thing. Suspended sediment are any particles found in the water column, whether the water is flowing or not. The suspended load, on the other hand, is the amount of sediment carried downstream within the water column by the water flow. Suspended loads require moving water, as the water flow

creates small upward currents (turbulence) that keep the particles above the bed. The size of the particles that can be carried as suspended load is dependent on the flow rate. Larger particles are more likely to fall through the upward currents to the bottom, unless the flow rate increases, increasing the turbulence at the streambed. In addition, suspended sediment will not necessarily remain suspended if the flow rate slows.

Wash load: The wash load is a subset of the suspended load. This load is comprised of the finest suspended sediment (typically less than 0.00195 mm in diameter). The wash load is differentiated from the suspended load because it will not settle to the bottom of a waterway during a low or no flow period. Instead, these particles remain in permanent suspension as they are small enough to bounce off water molecules and stay afloat. However, during flow periods, the wash load and suspended load are indistinguishable.

3. Sediment Transport Rate

The rate at which sediment is moved past a cross section of the flow is called either the sediment transport rate or the sediment discharge. It's related to the sediment load, but it's different, just because different fractions of the sediment load are transported at different rates. It can be measured in mass per unit time, or in weight per unit time, or in volume per unit time. The sediment transport rate is commonly denoted by Qs.

4. Estimation of Sedimentation

There are two approaches to obtaining values describing sediment loads in streams. One is based on direct measurement of the quantities of interest, and the other on relations developed between hydraulic parameters and sediment transport potential.

The total bed material load is equal to the sum of the bedload and the bed material part of the suspended load; in terms of volume transport per unit width, qt = qb + qs. Here wash load, i.e. that part of the suspended load that is too fine to be contained in measurable quantities in the river bed, is excluded from qs.

There are number of equations to compute the total sediment load. Most of these equations have some theoretical and empirical bases.

In 1973, Ackers and White developed a general theory for sediment transport which was calibrated against the flume-transport data then available. Their functions have been widely accepted as one of the best available procedures for estimating the total bed over the full width of the flow section.

Dandy Bolton formula is often used to calculate the sedimentation yield. But use of these equations to predict sediment yield for a specific location would be unwise because of the wide variability caused by local factors not considered in the equations development. However, they may provide a quick, rough approximation of mean sediment yields on a regional basis. Computed sediment yields normally would be low for highly erosive areas and high for well stabilized drainage basins with high plant density because the equations are derived from average values. The equations express the general relationships between sediment yield, runoff, and drainage area.

5. Sedimentation Yield

All of the water that reaches a stream and its tributaries carries sediment eroded from the entire area drained by it. The total amount of erosion debris exported from such a drainage basin is its sediment load or sediment discharge and the sediment yield is the sediment discharge divided by the total drainage area of the river upstream of the cross section at which the sediment discharge is measured or estimated. Sediment yield is generally expressed as a volume or weight per unit area of drainage basin—e.g., as tons per square kilometer. Further, sediment yield is usually measured during a period of years, and the results are thus expressed as an annual average.

v) Replenishment Study (As per EMGSM guidelines, 2020):

Replenishment study for a river solely depends on estimation of sediment load for any river system and the estimation is a time consuming and should be done over a period. The process in general is very slow and hardly measurable on season to season basis except otherwise the effect of flood is induced which is again a cyclic phenomenon. Usually, replenishment or sediment deposition quantities can be estimated in the following ways as given below:

A. Direct measurement of the sand bar upliftment, monitoring of the new sand bars created in the monsoon within the channel, elimination of sand bars during the monsoon etc. With systematic data acquisition, over a period, regression equations can be developed for modeling of the sediment yield and annual replenishment with variable components.

In this report, for volume estimation of sand, "Depth x Area" has been followed. The sand bars are interpreted with the help of satellite imageries. Ground truthing done for100% of the total identified sand bars. While ground truthing, width and length of each segment were physically measured. It has also been observed that in few cases, sand bars have attained more than 3 meters height from the average top level of the river beds. Considerations of sand resources have been restricted within 3 meters from the average top

surface of the river bed. Thus, in few occasions, heights for sand reserve estimation are found to be more than 3 meters.

B. The replenishment estimation based on a theoretical empirical formula with the estimation of bed-load transport comprising of analytical models to calculate the replenishment estimation.

A. Replenishment estimation

Sedimentation in any river is dependent on sediment yield and sediment yield depends on soil erosion in river's catchment area. Catchment yield is computed using Strange's Monsoon runoff tables for runoff coefficient against rainfall return period. Peak flood discharge calculated by using Dickens, Jarvis and Rational formula at 25, 50 and 100 years return period. The estimation of bed load transport using Ackers and White Equation.

Methodology Adopted: To delineate replenishment percentage in the river bed of the district, below mentioned steps have been followed.

- **Field data collation:**

Field data collations were done during April-2020, June-2020, November-2020 & March-2021 for starting period, pre monsoon period, post monsoon period & end period for the river ghats on continuous basis. However, the nonoperational areas were covered through traverses. In both the cases, relative elevation levels were captured through DGPS/ Electronic Total Station. Thickness of the sand bars was measured through sectional profiles. In few instances, sieve analysis of the sands was carried out to derive the size frequency analysis.

Physical benchmark also established using Total Station at the river site.

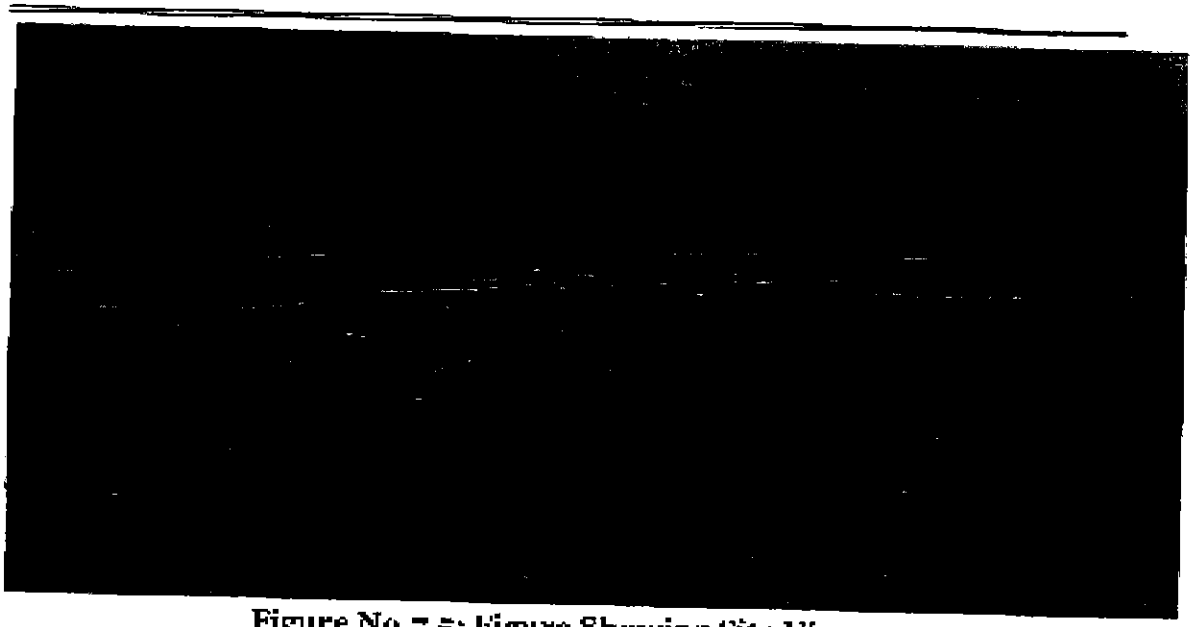

Figure No.7.5: Figure Showing Site View

- **Selection of Study profiles:**

Study profiles are selected based on the occurrence of the sand bars in the channel profiles. Aerial extents of each of the profiles are mapped from satellite imageries. Frequency distribution did while selection of the ground truthing of the blocks.

- **Data Compilation:**

Following data were compiled for generation of this annual replenishment report:

- Elevation levels of the different sand Ghats and Sand Bar's as measured at site.
- Extents of the sand bars are measured from the pre monsoon satellite imageries.
- Sand production data of the district.

- **Assessment of sediment load in the river:**

Assessment of sediment load in a river is subjective to study of the whole catchment area, weathering index of the various rock types which acts as a source of sediments in the specific river bed, rainfall data over a period not less than 20 years, and finally the detail monitoring of the river bed upliftment with time axis. Again, the sediment load estimation is not a dependent variable of the imaginary district boundary, but it largely depends upon the aerial extents of the catchment areas, which crossed the district and state boundaries

- **Estimation of annual sand deposition:**

The major sand producing rivers of the Aurangabad district are Sone, Punpun, Aadri, Madar and Batane rivers. Planning has been done for systematic sand mining in the rivers.

Altogether 72 sand bars has been identified. Out of the total 72 Ghats, 30 are falling in Sone River, 13 ghats are falling in Punpun River, 3 numbers of Ghats are falling in Aadri River, 18 numbers are falling in Batane River and 8 numbers are falling in Madar River.

To calculate area of these sand bars, a classification system has been adopted with three categories of land identified within the channel areas. the class which followed for classification are as follows:

a. The untapped Sand Bars.
b. The Sand bars worked in the pre-monsoon period.
c. Main channel course within the channel.

Details of each sand bars along with their sand resources in pre monsoon and post monsoon period are provided in below table no 7.5.

B. Replenishment estimation based on an empirical formula:

The river reaches with sand provide the resource and thus it is necessary to ascertain the rate of replenishment of the mineral. Regular replenishment study needs to be carried out to keep a balance between deposition and extraction. The replenishment estimation based on a theoretical empirical formula comprising of analytical models to calculate.

Sediment load deposition in a river is depend on catchment area, weathering index of the various rock types of the catchment area, land-use pattern of the area, rainfall data and grain size distribution of the sediments. Again, the sediment load estimation is not a dependent variable of the imaginary district boundary, but it largely depends upon the aerial extents of the catchment areas, which crossed the district and state boundaries.

i. Methodology of the study:

The replenishment estimation is based on a theoretical empirical formula with the estimation of bedload transport comprising of analytical models to calculate the replenishment estimation. Sedimentation in riverbed depends on catchment yield, peak flood discharge due to rainfall, bed load transport rates and sediment yield characteristic of the river. Some of the common methods used for Replenishment study are explained below.

Catchment Yield Calculation:

The total quantity of surface water that can be expected in a given period from a stream at the outlet of its catchment is known as yield of the catchment in that period. The annual yield from a catchment is the end product of various processes such as precipitation, infiltration and evapo-transpiration operating on the catchment.

Catchment Yield can be estimated using following formula:

Catchment Yield (m³) – Catchment area (m²)* Runoff coefficient (%)*Rainfall (m)

The runoff generated from the watershed is analyzed using Strange's Tables Method to get the reliable yield results. Runoff from a catchment is dependent upon annual rainfall as well as catchment characteristics such as soil types and the type of groundcover / land usage. Remote sensing was used for demarcation of catchment area relevant to the drainage system. Runoff coefficient of the catchment has been established based on Strange's table.

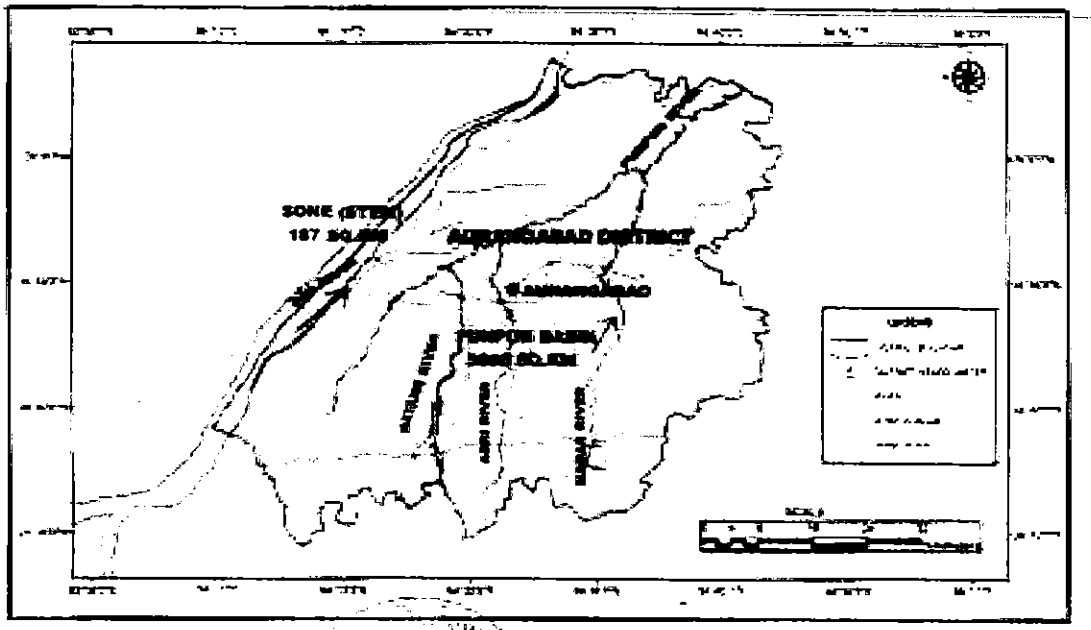

Figure No.7.11: Watershed map of Aurangabad District

Strange (1892) studied the available rainfall and runoff and obtained yield ratios as functions of indicators representing catchment characteristics. Catchments are classified as good, average and bad according to the relative magnitudes of yield they give. For example, catchment with good forest cover and having soils of high permeability would be classified as bad, while catchment having soils of low permeability and having little or no vegetal cover is termed good. Based on the study Strange established runoff coefficient table as given below:

Table No. 7.7: Runoff coefficient of the catchment based on Strange's table

Rainfall returns period for 25, 50 and 100 years calculated as below:

As per Weibull's Formula,

Return period/Recurrence interval = (n+1)/m

Where: n number of years on record;

m is the rank of observed occurrences when arranged in descending order.

a. Peak Flood Discharge Calculation:

The term "peak discharge" stands for the highest concentration of runoff from the basin area. The accurate estimation of flood discharge remains one of the major challenges as it depends upon physical characteristic of the catchment area and the flood intensity, duration and distribution pattern. There have been many different approaches for determining the peak runoff from an area. As a result many different models (equations) for peak discharge estimation have been developed. Formulas used for Peak Discharge calculation are as below:

As per Dicken's formula,

$Q = CA^{3/4}$

Where: Q is Maximum flood discharge (m^3/sec) in a river
A is Area of catchment in Sq. Km
C is Constant whose value varies widely between 2.8 to 5.6 for catchments in plains and 14 to 28 for catchments in hills

As per Jarvis formula,

$Q = CA^{1/2}$

Where: Q is Maximum flood discharge (m^3/sec) in a river
A is Area of catchment in Sq. Km
C is Constant whose value varies between 1.77 as minimum and 177 as maximum. Limiting or 100 percent chance floods are given by the value of C of 177

As per Rational formula,

$Q = CIA$

Where: Q is Maximum flood discharge (m^3/sec) in a river
A is Area of catchment in Sq. Km
C is Runoff coefficient which depends on the characteristics of the catchment area. It is a ratio of runoff: rainfall
I is Intensity of rainfall (in m/sec)

b. Bed Load Transport Calculation:

The most important problems in river engineering are to predict bed load transport rates in torrential floods flowing from mountainous

streams. Three modes of transport namely; rolling, sliding and saltation may occur simultaneously in bed load transport. The different modes of transportation are closely related and it is difficult, if not impossible, to separate them completely. There are number of equations to compute the total sediment load. Most of these equations have some theoretical and empirical bases.

Ackers and White Equation:

Ackers and White (1973) used dimensional analysis based on flow power concept and their proposed formula is as follows.

$$C_s = C_s G_s (d_{50}/h) (v/u_*)^{n'} [(F_{gr}/A_{cr}) - 1]^m$$

The dimensionless particle d_{gr} is calculated by:

$$d_{gr} = d_{50} (g(G_s-1)/v^2)^{1/3}$$

The particle mobility factor F_{gr} is calculated by:

$$F_{gr} = (U^{n'}/(G_s-1)g\, d_{50})^{1/2} * (V/(5.66\log(10h/d_{50}))^{1-n'}$$

Where,

A_{cr} = Critical particle mobility factor
C_s = Concentration coefficient in the sediment transport function
C_t = Total sediment concentration
d_{50} = Median grainsize
d_{gr} = Dimensionless particle diameter
F_{gr} = Particle mobility parameter
g = Acceleration of gravity
G_s, S_g = Specific gravity
h = Water depth
m = Exponent in the sediment transport function
n' = Manning roughness coefficient
U_* = Shear velocity
V = Mean flow velocity
v = Kinematic viscosity

Meyer – Peter's equation:

Meyer-Peter's equation is based on experimental work carried out at Federal Institute of Technology, Zurich. Mayer-Peter gave a dimensionless equation based, for the first time, on rational laws. Mayer- Peter equations giving an empirical correlation of bed load transport rates in flumes and natural rivers. The simplified Meyer-Peter's equation is given below:

$$g_b = 0.417[\tau_0 (\eta'/\eta)^{1.5} - \tau_c]^{1.5}$$

Where,

gb = Rate of bed load transport (by weight) in N per m width of channel per second.

SEIAA, Bihar

η' = Manning's coefficient pertaining to grain size on an unrippled bed and Strickler formula i.e. $\eta' = (1/24) \times d_{1/6}$ where d is the median size (d_{50}) of the bed sediment in m.

η = The actual observed value of the rugosity coefficient on rippled channels. Its value is generally taken as 0.020 for discharges of more than 1icumecs, and 0.0225 for lower discharges.

τc = Critical shear stress required to move the grain in N/m2 and given by equation$\tau c = 0.687 da$, where da is mean or average size of the sediment in mm. This arithmetic average size is usually found to vary between d_{50} and d_{60}.

τo = Unit tractive force produced by flowing water i.e.γwRS. Truly speaking, its value should be taken as the unit tractive force produced by the flowing water on bed = $0.97\gamma wRS$. R is the hydraulic mean depth of the channel (depth of flow for wider channel) and S is the bed slope.

c. Sediment Yield Estimation:

Sedimentation occurred as the velocity decreases along with its ability to carry sediment. Coarse sediments deposit first, then interfere with the channel conveyance, and may cause additional river meanders and distributaries. The area of the flowing water expands, the depth decreases, the velocity is reduced, and eventually even fine sediments begin to deposit. As a result, deltas may be formed in the upper portion of reservoirs. The deposited material may later be moved to deeper portions of the reservoir by hyraulic processes within the water body.

There are many sediment transport equations which are suitable for use in the prediction of the rate of replenishment of river. Some of the famous sediment equations are:

1. Dandy – Bolton Equation
2. Yang Equations
3. Engelund-Hansen Equation
4. Modified Universal Soil Loss Equation (MUSLE) developed by Williams and Berndt (1977)

Dandy – Bolton Equation:

Dandy – Bolton formula is often used to calculate the sedimentation yield because:-

- The formula uses catchment area and mean annual runoff as key determinants.
- It does not differentiate in basin wide smaller streams and their characteristics.
- Dandy and Bolton equation calculates all types of sediment yield i.e. Sheet and rill Erosion gully Erosion, Channel Bed and bank erosion and mass movement etc.

Dandy-Bolton determined the combined influence of runoff and drainage area on sediment yield to compute the sediment yield. They developed two equations i.e. for run off less than2 inch and for run off more than 2 inch, which are given below:

For run off less than 2 inch:

(Q<2in) S=1289*(Q) $^{0.46}$*[1.43-0.26 Log (A)]

For run off more than 2 inches:

(Q > 2 in): S= 1958*(e $^{-0.435*Q}$)*[1.43-0.26 Log (A)]
Where: S = Sediment yield (tons/sq miles/yr)

Q – Mean Annual runoff (inch)

A = Net drainage are in sq mile

Dandy Bolton formula is often used to calculate the sedimentation yield. But use of these equations to predict sediment yield for a specific location would be unwise because of the wide variability caused by local factors not considered in the equations development. However, they may provide a quick, rough approximation of mean sediment yields on a regional basis for preliminary watershed planning. Computed sediment yields normally would be low for highly erosive areas and high for well stabilized drainage basins with high plant density because the equations are derived from average values. The equations express the general relationships between sediment yield, runoff, and drainage area. Many variables influence sediment yield from a drainage basin. They include climate, drainage area, soils, geology, topography, vegetation and land use. The effect of any of these variables may vary greatly from one geographic location to another, and the relative importance of controlling factors often varies within a given land resource area. Studies revealed that sediment yield per unit area generally decreases as drainage area increases. As drainage area increases, average land slopes usually decrease; and there is less probability of an intense rainstorm over the entire basin. Both phenomena tend to decrease sediment yield per unit area. .

Modified Universal Soil Loss Equation (MUSLE):

Modified universal soil loss equation (MUSLE) for estimation of sediment yield is also used widely. MUSLE is a modification of the Universal Soil Loss Equation (USLE). USLE is an estimate of sheet and rill soil movement down a uniform slope using rain- fall energy as the erosive force acting on the soil (Wischmeier and Smith 1978). Depending on soil characteristics (texture, structure,organic matter, and permeability), some soils erode easily while others are inherently more resistant to the erosive action of rain- fall.

MUSLE is similar to USLE except for the energy component. USLE depends entirely upon rainfall as the source of erosive energy. MUSLE uses

SEIAA

- Sedimentation yield calculated as per Dandy Bolton formula as the equations express the general relationships between sediment yield, runoff, and drainage area.
- Computed sediment yields by Dandy Bolton formula normally would be low for highly erosive areas and high for well stabilized drainage basins with high plant density because the equations are derived from average values.

storm-based runoff volumes and runoff peak flows to simulate erosion and sediment yield (Williams 1995). The use of runoff variables rather than rainfall erosivity as the driving force enables MUSLE to estimate sediment yields for individual storm events. The generalized formula of MUSLE is as below:

$Y=11.8*(Q*qP).56 *K*Ls*C*P$

Where,

Y = sediment yield of stream (t/yr/km2),
Q = average annual runoff (m3),
K = soil erodibility factor.
qP = Highest discharge recorded (m3/s),
Ls = gradient/slope length,
C = cover management factor,
P = erosion control practice

ii. Estimation of Replenishment:

Aurangabad district is divided into two regions namely hard core rock region and Jalodhak region. The northern portion of the district is mostly consists of flat alluvial plain. In the southwestern part of this district, below the hills, sandy loam is found. The southern hilly unit is undulating in character, occupied by high mountain ranges and low valleys covering parts of Kutumba, Nabinagar, Deo and Madanpur blocks. The constituting rocks of the hills dip northward and form the basement of the northern lying Gangetic Plain. Elevation of the land surface is varying from 411 m in the south to 80 m in the north.
The district is drained by Sone in the West and by the Punpun and their tributaries in the central part of the terrain. These rivers and its tributary rivers are forming the main catchment area.

For replenishment study, following assumption/calculation taken in to consideration:

- Catchment area (Watershed area) against each river has been calculated based on remote sensing data.
- Rainfall runoff coefficient as per Strange's table for the catchment area is consider 36%, as the rainfall in the district is 978.9mm and the characteristic of the catchment of the district is good in nature.
- Peak flood discharge of the river of the district calculated based on Dicken's formula which is more applicable to north Indian and central Indian catchment. Here Dicken constant C is taken as 12 in present study as per published literature by Abhijit Saha, 2002.
- Bed load transport has not been computed in the regional aspect of the district, as the values are highly dependent on local factors such as particle mobility factor, roughness coefficient, Shear velocity, Mean flow velocity, Kinematic viscosity etc.

Sand bar area recommended for mineral concession in the above table is being calculated as per the Enforcement & Monitoring Guidelines for Sand Mining (EMGSM) 2020. As per guidelines, mining depth restricted to 3 meters depth and distance from the bank is ¼th of river width and not be less than 7.5 meters. Also, mining is prohibited up to a distance of 1 kilometer (1 km) from major bridges and highways on both sides, or five times (5x) of the span (x) of a bridge/public civil structure (including water intake points) on up-stream side and ten times (10x) the span of such bridge on down-stream side, subjected to a minimum of 250 meters on the upstream side and 500 meters on the downstream side.

8. Overview of mining activity in the district:

a. General overview:

The district is not very rich in mineral resources and there are no large mines in the district. However, collection of sand, Soil and Brick Earth are the minor mineral sources. These materials are primarily utilized for construction purpose. As per the present practice, mining is done by manual method with tools and tackles. Mechanised & Semi mechanised practice is also popular in some places.

List of existing mining leases of the districts is furnished as Annexure 1.

10. Transport (Railway, road):

The district of Aurangabad is well served by a network of roads. Road communication is the main mode of transportation in this district. The roads are classified as the National Highways, State Highways, Major district roads and other district roads. They are maintained by the Public works Department, the Rural Engineering Organisation, the Zila Parishad and Municipalities. It is also connected with the interior of the district by metalled road. Two National Highway (NH) and Two State Highway (SH) cross the district. NH- 2 and NH-98 pass through the district. SH-7 and SH-11 also passes through the district.

The famous Grand Trunk Road (National Highway No.2) passes via the town of Aurangabad. The Grand Trunk Road has put the district on the road map of the country and provides easy transport facility to Calcutta in the east and Delhi in the west.

The district of Aurangabad has a railway communication system. It is served by East Central Railway. A railway line from daltonganj passes through the Aurangabad district, almost parallel tothe river Sone and joins the Grand Chord line at Sone Nagar.

Aurangabad is not well connected to other major cities of the country via regular flights. The nearest airport is Jay Prakash Narayan International Airport in Patna at a distance around 140kms in North-East direction.

A transportation map of Aurangabad district is furnished as Figure 10.1.

11. Remedial measure to mitigate the impact of mining

11.1Environmental Sensitivity

The Aurangabad area represents a unique geo- environmental perception. As human population expands, forests are being depleted for the extension of agricultural lands, introduction of new settlements, roadways etc. The growing changes is coming in the wake of urbanization and industrialization leave deep impression on the hill ecosystem; disrupting normal functioning.

Due to unprecedented growth of population during the last few, nature has started reacting sharply to the accumulated human guilt. Soil erosion and its conservation play an important role. Because of the presence of very thin soil cover plays an important role in the socio-economic development.

The adverse effect of this unscientific mining is realized in the form of landslide, removal of soil cover, siltation of river beds leading to frequent floods, endangering the lives and properties of local inhabitants.

11.2 Sand mining Impact

Another serious environmental problem around the globe in recent years is of Sand mining. Sand mining is a process of extraction of sand from an open pit, river bed, sea beaches, ocean floor, river banks, deltas and island dunes. The extracted sand could be utilised for various types of manufacturing, such as concrete used in the construction of building and other structures. The sand can also be used as an abrasive. The demand for sand increase as population grows also urbanization with time. The high level of demands have offer led to the use of unsustainable sand mining process for speedy urbanisation resulted in illegal mining.

All though most jurisdictions have legal limit on the location and volume of sand that can be mined, illegal sand extraction is following in many parts of the country due to rapid urbanisation and industries.

Removal or extraction of too much sand from rivers leads to erosion shrinking of river banks. Deltas can recede due to sand mining. These destructive effects of sand mining ultimately result in loss of fertile land and property. It also destabilized the ground and causes the failure of engineering structures for civilization.

In-stream mining directly alters the channel geometry and bed elevation. By removing sediment from the channel, in-stream material extraction disrupts the preexisting balance between sediment supply and transporting capacity, typically inducing incision upstream and downstream of the extraction site. The resultant incision alters the frequency of floodplain inundation along the river courses, lowers valley floor water tables and frequently leads to destruction of bridges and channelization structures.

Sand Mining in beaches disturbs the ecosystem of different fauna of the beaches. The sand mining from natural barriers, made up of sand, causes flooding of the natural habitat. The sand mining activity destroys the aesthetic beauty of beaches and river bank and makes the ecosystem unstable. If there are popular tourist destination, tourism potential of such areas will lose.

It could be concluding that there has been little in depth research in to the environmental and social also political effect of land use practice and calls for urgent redressed by the competent authority.

11.3 Remedial measure

11.3.1 Sustainable Mining Practices:

- The depth of mining in Riverbed shall not exceed 3 meter or water level whichever is less, provided that where the Joint Inspection Committee certifies about excessive deposit or over accumulation of mineral.
- Mining shall be done in layers of 3 meter depth to avoid ponding effect and after first layer is excavated, the process will be repeated for the next layers.
- No stream should be diverted for the purpose of sand mining. No natural water course and/ or water resources are obstructed due to mining operations.
- No blasting shall be resorted to in River mining and without permission at any other place.

11.3.2 Monitoring the Mining of Mineral and its Transportation:

- For each mining lease site the access should be controlled in a way that vehicles carrying mineral from that area are tracked and accounted for.
- There should be regular monitoring of the mining activities in the State to ensure effective compliance of stipulated EC conditions and of the provisions under the Minor Mineral Concessions Rules framed by the State Government.

11.3.3 Noise Management:

- Noise arising out of mining and processing shall be abated and controlled at source to keep within permissible limit.
- Restricted sand mining operation has to be carried out between 6 am to 7 pm.

11.3.4 Air Pollution and Dust Management:

- The pollution due to transportation load on the environment will be effectively controlled and water sprinkling will also be done regularly.
- Air Pollution due to dust, exhaust emission or fumes during mining and processing phase should be controlled and kept in permissible limits specified under environmental laws.
- The mineral transportation shall be carried out through covered trucks only and the vehicles carrying the mineral shall not be overloaded. Wheel washing facility should be installed and used.

11.3.5 Bio-Diversity Protection:

- Restoration of flora affected by mining should be done immediately. Twice the number of trees destroyed by mining to be planted preferably of indigenous species. Each EC holder should plant and maintain for lease period at least 5 trees per hectare in area near lease.
- No mining lease shall be granted in the forest area without forest clearance in accordance with the provisions of the Forest Conservation Act, 1980 and the rules made there under.
- Protection of turtle and bird habitats shall be ensured.
- No felling of tree near quarry is allowed. For mining lease within 10km of the National Park / Sanctuary or in Eco-Sensitive Zone of the Protected Area, recommendation of Standing Committee of National Board of Wild Life (NBWL) have to be obtained as per the Hon'ble Supreme Court order in I.A. No. 460 of 2004
- Spring sources should not be affected due to mining activities. Necessary Protection measures are to be incorporated.

11.3.6 Management of Instability and Erosion:

- Removal, stacking and utilization of top soil in mining are should be ensured. Where top soil cannot be used concurrently, it shall be stored separately for future use keeping in view that the bacterial organism should not die and should be spread nearby area.
- The EC should stipulate conditions for adequate steps to check soil erosion and control debris flow etc. by constructing engineering structures
- Use of oversize material to control erosion and movement of sediments
- No overhangs shall be allowed to be formed due to mining and mining shall not be allowed in area where subsidence of rocks is likely to occur due to steep angle of slope.

- Controlled clearance of riparian vegetation to be undertaken.

11.3.7 Waste Management:

- Site clearance and tidiness is very much needed to have less visual impact of mining.
- Dumping of waste shall be done in earmarked places as approved in Mining Plan.
- Rubbish burial shall not be done in the Rivers.

11.3.8 Pollution Prevention:

- Take all possible precautions for the protection of environment and control of pollution.
- Effluent discharge should be kept to the minimum and it should meet the standards prescribed.

11.3.9 Protection of Infrastructure:

- Mining activities shall not be done for mine lease where mining can cause danger to site of flood protection works, places of cultural, religious, historical, and archeological importance.
- For carrying out mining in proximity to any bridge or embankment, appropriate safety zone should be worked out on case-to-case basis, taking into account the structural parameters, location aspects and flow rate, and no mining should be carried out in the safety zone so worked out.

SEIAA, Bihar

12. Suggested reclamation plan for already mined out areas

As per statute all mines/quarries are to be properly reclaimed before final closure of the mine. Reclamation plans should include:

a) A baseline survey consisting of existing condition cross-section data. Cross-sections must be surveyed between two monumental endpoints set back from the top of bank, and elevations should be referenced bench mark set;

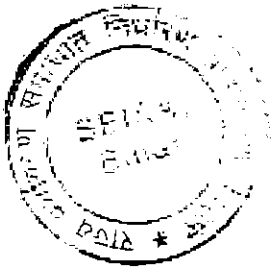

b) The proposed mining cross-section data should be plotted over the baseline data to illustrate the vertical extent of the proposed excavation;

c) The cross-section of the replenished bar should be the same as the baseline data. This illustrates that the bar elevation after the bar is replenished will be the same as the bar before extraction;

d) A planimetric map showing the aerial extent of the excavation and extent of the riparian buffers;

e) A planting plan developed by a plant ecologist familiar with the flora of the river for any areas such as roads that need to be restored;

f) A monitoring plan has to establish.

13. Risk assessment and disaster management plan

Risk analysis is the systematic study of risks encountered during various stages of mining operation. Risk analysis seek to identify the risks involved in mining operations, to understand how and when they arise, and estimate the impact (financial or otherwise) of adverse outcomes. The sand mining operation in the district is mainly done manually.

13.1 Identification of risk due to river sand mining

There is no land degradation due to mining activities as mining is done only on river bed dry surface. There will be no OB or waste generation as the sand is exposed in the river bed and is completely selable. There will be neither any stacking of soil nor creation of OB dumps. The mining activity will carried out up to a maximum depth of 3m below the surface level. So, there is no chance of slope failure, bench failure in the mines. However, there are some identified risk in the mining activity which are as below:

1. Accident during sand loading and transportation
2. Inundation/ Flooding
3. Quick Sand Condition

13.2 Mitigation measures

13.2.1 Measures to prevent accidents during loading and transportation:

- During the loading truck would be brought to a lower level so that the loading operation suits to the ergonomic condition of the workers.
- The workers will be provided with gloves and safety shoes during loading.
- Opening of the side covers of the truck should be done carefully and with warning to prevent injury to the loaders.
- Mining Operations will be takes place during daylight only.
- The truck will be covered with tarpaulin and maintained to prevent any spillage.
- To avoid danger while reversing the trackless vehicles especially at the embankment and tipping points, all areas for reversing of Lorries should be made man free as far as possible.
- All transportation within the main working will be carried out directly under the supervision and control of the management.
- Overloading should not be permitted and the maximum permissible speed limit should be ensured.
- There will be regular maintenance of the trucks and the drivers will have valid driving license.

SEIAA, Bihar

13.2.2 Measures to prevent incidents during Inundation/ Flooding:

To minimize the risk of flooding/ inundation following measures will be under taken:

- Mining will be completely closed during the monsoon months.
- Proper weather information particularly on rain should be kept during the operational period of mines so that precautionary measures will be undertaken.

13.2.3 Measures for mitigation in quick sand condition:

- Quick sand zone and deep water zone will be clearly demarcated and all the mines workers will made aware of the location.
- Mining will done strictly as per the approved mining plan.

13.3 Disaster management plan

As the depth of mining will be maximum of 3m below the surface level considering local condition, the risk related to mining activity is much less. The mining operation will be carried out under the supervision experienced and qualified Mines Manager having Certificate of Competency to manage the mines granted by DGMS. All the provisions of Mines Act 1952, MMR 1961 and Mines Rules 1955 and other laws applicable to mine will strictly be complied. During heavy rainfall and during the monsoon season the mining activities will be closed. Proper coordination with Irrigation Department should be maintained so that at the time of releasing water, if any, from the dam suitable warning/information is given in advance. Special attention and requisite precautions shall be taken while working in areas of geological weakness like existence of slip, fault etc. The mining site will be supplied with first-aid facilities and the entire mines worker will have access to that.

14. Utilization of Sand

Sand is a multi-purpose topographical material. It is known as one of the three fundamental ingredients in concrete. The composition of sand is diverse. Mostly sand is made of silica which is a common element. It can also come from another source of minerals like quartz, limestone, or gypsum.

From beds to flood plains to coastlines- we can find the sand at almost everywhere. The robustness of sand has played a significant role in everyday life. We use sand practically every other day.

Sand extraction from river beds and brick earth mining for making raw bricks are the main mining activities in the district. With a spurt in construction of real estate sectors and various govt. sponsored projects, the demand for both sand and bricks has increased manifold. The extraction of sand is carried out either manually or through semi- mechanized system. The depth of mining for both river bed sand and brick earth are restricted due to statutory provision in the regulations pertaining to conservation and development of minor minerals.

River sand mining is a common practice as habitation concentrates along the rivers and the mining locations are preferred near the markets or along the transportation route, for reducing the transportation cost.

In the real world, there are a lot of situations where we can find uses of sand. Followings are the common sand uses.

15. While bunging metal, we can mix sand with clay binder for frameworks used in the foundries.

16. Sand can be used for cleaning up oil leak or any spill by dredging sand on that spill. The material will form clumps by soaking up, and we can quickly clean the mess.

17. Sand can be used as a road base which is a protective layer underneath all roads

18. Industrial sand is used to make glass, as foundry sand and as abrasive sand.

19. One creative usage of sand is serving as a candle holder. We can try putting some sand before pouring tea light or any candle in a glass. It holds the candle still and refrain the candle from rolling by giving it an excellent decoration.

20. Adds texture and aesthetic appeal to space.

21. Sand is mostly pure to handle, promptly available and economically wise

22 We use sand in aquariums, fabricating artificial fringing reefs, and in human-made beaches

23 Sandy soils are ideal for growing crops, fruits and vegetables like watermelon, peaches, peanuts, etc.

24 Sand can light a path by filling mason jars with sand and tea light which is another inexpensive way to make a walkway glow.

SEIAA, Bihar

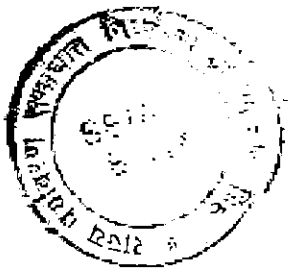

25. Sand helps to improve resistance (and thus traffic safety) in icy or snowy conditions.

26. We need sand in the beaches where tides, storms or any form of preconceived changes to the shoreline crumble the first sand.

27. Sand containing silica is used for making glass in the automobile and food industry- even household products for the kitchen.

28. Sand is a strong strand which is used for plaster, mortar, concrete, and asphalt.

The usual bricks formulated of clay only are way weaker and lesser in weight than blocks made of clay mixed with sand.

15. Conclusion:

1. It has been observed during the preparation of district survey report that Aurangabad district do not have any in-situ minor mineral occurrences as per the till date studies being carried out by various authorities and agencies. Riverbed sand and Brick earth are the only minor minerals of Aurangabad District.
2. The replenishment study has been carried out during the preparation of this DSR after analysing datasets of consecutive calendar years.
3. Both field-based survey coupled with satellite imagery study and empirical study were carried out to determine the rate of replenishment in each river of the district.
4. The determined values of various methods as adopted for replenishment study gives a comparable value and in all cases the values are found to be much more as compared to the capping limit (60%) as suggested in the Enforcement & Monitoring Guidelines for Sand Mining (EMGSM) January 2020, Issued by Ministry of Environment, Forest and Climate Change (MoEF & CC) 2020.
5. It is suggested to have a periodical review along with field data acquisition during pre and post monsoon periods to record the seasonal variance of the sedimentation rate on annual basis and update this DSR in case of any abnormal findings.

Government of Bihar
Department of Mines & Geology

Notification

S.S. No- 2/M.M.(Ba) 227/18-...2650...../M, Patna, Dated- 14/8/19

BIHAR SAND MINING POLICY, 2019

No. ...2650..... **Bihar Sand Mining Policy, 2019** is hereby notified for reasons and objectives stated below:-

1. Sand is one of the most important construction materials. Ensuring its availability is vital for the development of the infrastructure in the state. The most important source of sand is the river. The extraction of sand from the river bodies has to be regulated and done with adoption of required environmental safeguards.
2. Bihar has deposits of sand used for both construction and filling purposes. Districts falling south of the river Ganga have yellow sand used for construction whereas districts falling north of the river Ganga have only white sand which is primarily used for filling purposes. Settlement potential of yellow sand districts differs from those of white sand, as there is ahuge demand for construction sand whereas sand used for filling purposes has limited potential.
3. The State Sand Policy, 2013 was framed vide Notification No. 2214/M, dated 27.08.2013 wherein every river as a whole situated in each district was considered as a single stretch. For the purpose of settlement, all rivers in a district were treated as individual stretches and all such stretches in one district was combined into one single unit. Provision was also made for combined settlement of two or more districts as one single unit. Altogether 25 sand units were formed in 29 districts under the 2013 Sand Policy.

Dated. 13.08.2019 Re modifcalton

4. The settlement of multiple districts with one individual/company ultimately created larger vested interests and a monopolistic system. Small players had no role in this system.

5. The main objectives of the new Sand policy 2019, are threefold :- (i) to ensure that sand mining is done in an environmentally sustainable manner, (ii)to ensure availability of adequate quantity of sand for construction at a reasonable price and (iii)to increase the number of settlees to ensure generation of employment. The settlement of sand is proposed to be done in following manner:-

Sand Ghat Units:-

(i) Every river in district shall be considered as a different reach and major sand reaches like Sone, Kiul, Falgu, Morhar and Chanan shall be divided into sustainable contiguous blocks, wherever possible, keeping in mind the topography of the river for settlement.

(ii) Similarly other reaches within a district shall be divided as per requirement for the purpose of settlement.

6. **Procedure for Settlement of Sand Ghats :-**

(A) Any individual / registered companies / partnerships / Societies including co-operative societies shall be eligible to bid for maximum two sand blocks or upto an area of 200 hectares whichever is less. The upper limit shall be applicable for rivers mentioned in Para 5(i) above only. For other rivers the department shall be competent to decide maximum number/ area of sand block.

(B) (i) The settlement of sandghats shall be done in favour of the highest bidder through e-tender –cum- auction amongst the tenderers whose technical bids are found to be technically
